STRATFORD: Aug. 8.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade was done at the undermentioned prices:—Cabbages, 2s. to 4s. per tally; Cauliflowers, 9d. to 1s. per dozen; 1s. 6d. to 2s. 6d. per pad; Turnips, 2s. 6d. to 3s. 6d. per dozen bunches; Carrots, household, 1s. 6d. to 3s. do.; Apples, English, 2s. to 3s. 6d. per bushel; Watercress, 3s. to 4s. per flat; Peas, 4s. to 4s. 6d. per flat; Grapes, 4s. to 4s. 6d. per flat; Plums, 3s. to 4s. 6d. per flat; Broad Beans, 1s. to 2s. per bag; Scarlet Beans, 5s. 6d. to 6s. per s eve; Marrows, 1s. 6d. to 2s. per dozen; Cucumbers, 1s. to 2s. 6d. per dozen; do., field, 9d. to 1s. per dozen.

FARRINGTON: Aug. 9.—Quotations:—Cabbages, 3s. 6d. to 6s. per tally; Parsley, 1s. 6d.; Carrots, 2s. 6d. to 4s. per dozen bunches; Onions, Egyptian, 5s. 6d. to 6s. per cwt.; Marrows, 1s. 3d. to 1s. 6d. per dozen; Cucumbers, 2s. to 2s. 6d. per dozen.

FARRINGTON: Aug. 10.—Quotations:—Apples, 2s. 6d. per bushel; Pears, William, 4s. do.; Plums, 2s. per half-bushel; Tomatos, English, 4d. per pound; Grapes 6d. do.; Melons, 5s. to 6s. per case.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending August 5, and for the corresponding period last year:—1893: Wheat, 26s. 2d.; Barley, 21s. 8d.; Oats, 21s. 5d. 1892: Wheat, 29s. 7d.; Barley, 23s. 8d.; Oats, 21s. 6d.

HAY.

Averages.—The following are the averages of prices at the principal metropolitan markets during the past week:—Clover, prime, 140s. to 160s.; new, do., 115s. to 130s.; inferior, do., 100s. to 120s.; hay, best, 145s. to 165s.; inferior, do., 90s. to 100s.; new, mixture, 115s. to 130s.; and straw, 30s. to 50s. per load.

NOTICES TO CORRESPONDENTS.

BOOKS: C. M. B. *Choice Stove and Greenhouse Plants* by B. S. Williams, Paradise and Victoria Nurseries, Holloway, N. *Greenhouse and Stove Plants* by T. Baines: John Murray, Albemarle Street, London, W.C.

CARNATION LOTTIE KIRLEW: G. H. The bouquet was a charming one; the flowers large and well developed, and without run-colouring.

CARNATIONS: R. W. P. We have seen much superior flowers; but if the habit is robust and the plants are free-flowering, they are acquisitions for the border.—T. R. Eel-worms in the leaves, often figured in *Gardeners' Chronicle*.

CRACKING OF TOMATO FRUITS: Vestas. Keep the plants drier at the root, a daily supply of water is too much for them.

CUCUMBER DISEASE: J. H. I. The Cucumber looks badly enough with the large yellow blotches, but there is no sign of fungus disease, the cuticle is not punctured, and there are no pustules or mycelium. The cause is somewhere else, and not in the fruit. There is no rot or rotting of the tissues, the etiolated cells have a normal appearance, except for the absence of chlorophyll. No local disease in the fruit, which is healthy enough except for the discoloration.—J. J. Eel-worms at the root, so often figured in *Gardeners' Chronicle*. There is no cure. Turn out the soil and get fresh.

DISEASED ERANTHEMUM: Ignorant. There are plenty of "scale" on the leaves, and we find also acari, somewhat like the red spider but colourless. The whitish pustules are all superficial oily matter, and the brown dots are clumps of eggs. There are no fungi or real disease, but plenty both scale and acari, sufficient to account for anything.

LARGE PEACHES: W. C. The fruits arrived in bad condition, but we could see that they were very large. The flavour was not good. What is the name of the variety?

LETTUCES: Enquirer. Your plants were attacked by the young of woodlice, as were those from "A. M." mentioned in the Notices to Correspondents column of July 29. With such a temporary crop we cannot advise you to do anything, but when the ground has been cleared, a good dressing with quicklime will no doubt prevent a recurrence of the mischief.

MELON: Subscriber. The leaves appear to be burned with some kind of insecticide. From leaves alone we cannot form any opinion of the cause of the plants "going off."

NAMES OF FRUITS: J. R. B. 1, Beurré superfin; 2, Louise Bonne of Jersey; 3, Williams' Bon Chré-

tien; 4, Forelle; 5, poor specimen, cannot tell; 6, Duchesse d'Angoulême.—W. J. T. Apple, Nonsuch; Plum, Mitchellson's.—J. P. Dixon. 1 and 2, Red Astrachan; 3, Cellini; 4, King of the Pippins; 5 and 6, specimens not developed.—R. Neville White. 1, Windsor; 3, Marie Louise; 4, Caillot Rosat.—J. G. Peaches cannot be determined by the fruit alone. Apricot, Turkey. Plums: 7, 8, and 9, Victoria; 3, Oullin's Golden Gage; 4, Kirke's; 6, Princess of Wales. W. G. Sorby. Apple, Irish Peach.—J. J. Wenham. 1, Duchess; 2, Gacogne's Seedling; 4, Pott's Seedling; 5, Mère de Ménage; 6, rotten, probably Lord Suffolk.—Nuncaton. Apple not sufficiently developed.

NAMES OF PLANTS: S. A. M. Wretched and shrivelled specimens: they are so far as we can make out. 1, *Polygala Dalmaisiana*; 2, *Il-lanthus rigidus*; 3, *Pulmonaria officinalis*; 4, *Stachys lanatus*; 5, *Lysimachia thyriflora*; 6, *Sedum rupestre*; 7, *Gypsophila paniculata*; 8, *Hemerocallis flava*.—R. M. *Hibiscus syriacus*, semi-double form.—G. G. C. *Echium vulgare*.—Bournemouth. No. 1 is *Cotoneaster Simonsi*; No. 2 we do not recognise, but it is probably also a *Cotoneaster*. Do we understand you that the two "were taken off the same plant?" It seems highly improbable.—T. D. Blandford. The *Cattleya Rex* is an ordinary variety. The yellow flower is *Spathoglottis Fortunei*, not *Sarcopodium*. Your semi-double flowers of *Platycodon* are unusual.—G. H. 1, *Campanula medium*, double white; 2, *Veronica subsessilis*; 3, *Helenium autumnale*; 4, *Montbretia crocosmiflora*; 5, *Phygelius capensis*; 6, *Lychnis chalcedonica*; 7, *Helichrysum grandiflorum*; 8, *Rudbeckia californica*; 9, *Galega officinalis alba*; 10, *Dactylis glomerata variegata*; 11, *Monarda didyma*; 12, *Centranthus ruber*; 13, *Campanula Rapunculus*; 14, *Eupatorium maculatum*; 15, *Lythrum Salicaria*; 16, *Centaurea montana*. Our limit is six; have mercy upon us in future, or we shall charge you for our time.—E. D. L. 1, cannot be identified; 2, *Aster paniculatus*; 3, *Grindelia squarrosa*; 4, *Lysimachia vulgaris*; 5, *Senecio ligularia*; 6, *Artemisia abrotanum*; 7, *Solidago neglecta*.

PEARS WITH DYING LEAVES: Salopian. The leaves sent have been eaten away on the surface by slug-worms, which are the grubs of certain sawflies. The slugworm proper, is the grub of *Selandria cerasi*. It derives its name from the black slime that covers its hairy body till the last moult. Hellebore powder mixed with water is the best remedy. If you sent any of the grubs, they had escaped in transit, as we found none. For figure see *Gardeners' Chronicle* for October 27, 1888.

SCARLET RUNNERS: C. W. D. The falling of the blossom has been general this year, and is no doubt due to some obstruction of the circulation, by reason of which the proper amount of water has not reached the flower. The extreme heat and unusual sunlight may have caused a premature ripening and drying up of the flower-stalks, even though the roots were, as in your case, in relatively moist soil. The flowers are not malformed.

SEEDS OF POLYGONUM SACHALINENSE: F. R. We do not suppose that seeds are yet being disposed of by those few persons who have them, but rhizomes may be purchased, every bit of which will grow.

SHOWER BOUQUET: P. W. Yes, this should be made much the same as an ordinary bouquet, except that it should be trailing. For this purpose something light and graceful should be used, such as *Asparagus plumosus*, or *Myrsiphyllum* (*Smilax*) *asparagoides*, and the flowers with long stems must be wired with the stems pointing towards the bouquet. You will, however, require some practice, and possibly a lesson or two from a skilled florist before you will make them prettily.

WHITE CACTUS DAHLIA: W. B. S. A very nice variety, but without any decided points of superiority over others of the class.

COMMUNICATIONS RECEIVED.—J. Sutherland.—H. H. A.—H. Grunberg, Erfurt.—Pannel Nys.—G. W. & Son.—C. W. D.—G. L.—T. H.—C. E.—H. J. R. Vireggio.—A. S. B.—H. E. M.—B. Marseille.—John Spink.—T. F.—T. THE IMPROVED GARDEN GULLY
(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for billy walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s.
(The larger sizes are very strong for carriage drives.)
Full Particulars and Testimonials on application.

TO FLORISTS.—A thoroughly experienced hand in bouquets, wreaths, fancy designs, &c., wants situation.—**B.**, 62, Camden Road, N.W.

A DAY AT "APPY AMSTEAD" is thoroughly enjoyed by the Fast End poor, as is amply proved by the immense crowds who flock there every Bank Holiday. The pure air and bracing atmosphere to be found in the breezy heights of Highbury and its neighbourhood cannot fail to benefit those who can only spend a few hours in their midst. Holidays, however, cannot be fully enjoyed by those persons who are suffering from disease. Holloway's Pills and Ointment can speedily remove this drawback to pleasure if a fair trial is only afforded them. As a cure for rheumatism, gout, fevers, diarrhoea, diseases of the skin, scrofula, ulcers, sores, burns, or old wounds, they are beyond competition.

SANKEY'S famous GARDEN POTS

Bulwell Potteries, Nottingham.

Messrs. Dicksons, Limited, Chester, write:—"The Flower Pots you have so largely supplied us with are light, strong and well made, and in every respect highly satisfactory."

Messrs. Richard Smith & Co., Worcester, write:—"We beg to say that we are highly satisfied with your Garden Pots; they are well made, light, yet strong, and we like them better than any other we have ever used."

Mr. William Bull, 536, King's Road, Chelsea, London, writes:—"For nearly thirty years I have been using your Garden Pots, and still find them the best and cheapest."

Largest Manufacturers in the World. No Waiting. Millions in Stock. Carriage and Breakage Free on £10 Orders. Half Carriage on £5 Orders. Samples Free.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Greenhouses, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, buildings the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

SATURDAY, AUGUST 19, 1893.

HAMPTON COURT.

THE bedding display at this favourite place of resort has long had a high reputation, but it never better deserved that reputation than this season. The authorities there seem to have a liberal supply of water at their disposal, and hence now the grass is delightfully green, and the flowers in glorious bloom. A mere count of the beds here gives a very indifferent idea as to the extent of the floral display, because some beds are of such exceeding dimensions; but all down the lawn side of the noble broad parade there are some sixty; and on the broad, fan-shaped area fronting the palace, and enclosing the fish-pond and fountain, are some eighty others; in addition to which there is on the palace side of the parade some 500 yards run of border, in the back part of which Hollyhocks, Dahlias, Sunflowers, hardy plants, &c., flourish, whilst the entire length is faced by a line of Crystal Palace Gem Pelargonium, and a beautiful edging of *Dactylis glomerata variegata*, intermixed with the famous old *Viola Blue Bell*. This capital variety is largely employed in the bedding, and it, with Flower of Spring Pelargonium, dwarf marbled *Abutilons*, &c., makes some charming combinations.

Below the palace a border runs to the river-front, chiefly devoted to hardy plants. This and the other border is far too narrow for the surroundings, and should be doubled in width, to give which some of the too broad gravel parade might well be spared.

Naturally, the most attractive beds are those which line the lawn side of the broad parade, which runs from the Hampton Road to the river-front, and a very noble parade it is too. Here we find some very brilliant masses of Pelargoniums, *H. Jacoby*, *Tom Bowling*, *Lord Gifford*, *Vesuvius*, &c., which give colour of the richest, and pinks and salmons, too, are plentiful. It is, indeed, a grand season for these zonals, and how superbly they bloom this hot parching weather. Last year they looked badly. Now they are looking grandly. Of course these are edged with some notable plants, such as golden *Harry Hieover*, *Manglesi*, mixed with dwarf *Ageratum*, *Gnaphalium*, &c. Some of these Pelargonium beds must have taken several hundreds of plants. Those who like colour will find it here, and let me say also that a great public garden like this is a place in which popular tastes are to be studied rather than any individual fancies, hence it is that the bedding is so remarkably varied, that everybody finds something to be delighted with. Perhaps the most beautiful beds—they are so, at least, in my eyes—are several planted thinly, with fine crimson-flowered *Begonias*, intermixed with a few good white *Fuchsias*, the carpet being of *Koniga variegata*, and mauve *Viola Mrs. Turner*, edged by *Mrs. Pollock Pelargonium*, and the bushy zonal *Wallacii*. Two others are edged with golden *Chickweed*. Some *Begonia* beds are planted with selected white varieties, intermixed with *Zinnias*, of which they have here a capital strain. A big mass of the beautiful *Begonia*

Northiana, edged with the violet-leaved Coleus Taylor's Pet and golden-leaved Pelargonium Golden Superb intermixed will soon be a beautiful mass. In the bed at the extreme river end is one of mixed white and red Fuchsias, Zinnias, and Ivy-leaf Pelargoniums, edged with this Northiana in beautiful bloom, and further margined with Echeveria secunda glauca and Sedum glaucum. Whilst the Pelargoniums give almost exclusively the masses of colour, there are, beyond those we have mentioned, very many and remarkably attractive mixed beds, indeed those preferring the mixed style may have their fill here. Huge beds filled with tall Marguerites, Abutilons, White Tobaccos, Pentstemons, Petunias, Zinnias, &c., with a base of Pelargoniums, Dwarf Nasturtiums, &c., edged with a stiff margin of Euconymus radicans variegata, or some other suitable material, are beautiful of their kind. A most pleasing mixture in one case consists of Abutilon niveum maculatum, beneath which is a mass of blue Ageratum, and some single red Petunias. This is really charming, but the Gnaphalium edging is too dwarf to sustain the centre well. Giant Castor-oils and white Tobaccos, too, are charming, especially after the sun has passed off them. To a mixed bed of Fuchsias, &c., is an effective edging of Golden-leaved Arabis mollis; and a big mass of Scarlet Pelargoniums is pleasingly margined with Cannell's Dwarf Ageratum and Gnaphalium lanatum. In another place, Centaurea ragusina and Blue Lobelia intermixed, make a pretty edging. A real old-fashioned and lovely bed is one entirely of seedling Verbenas, a beautiful and a first-rate mixture, without an edging. The flowers are of as fine quality as they are varied in colour, and show how readily from seed now we may have this beautiful flower at its very best. Whilst it is possible to refer only to representative beds, myriads must go now comparatively unnoticed. Lovers of summer-bedding may do far worse than pay a visit to Hampton Court just now, and have their fill.

I purposely left mention of the carpet-beds, so-called, to the last, for these there is amongst the *élite* of horticulture much apparent distaste, although I am not quite sure that it is all real, but amongst the masses—the uncultured in floral taste, there can be no question as to their popularity. After all, what is summer-bedding but pictures in colours, whether of flowers or foliage? And if we may not employ the greens, golds, crimsons, and many other hues found in dwarf carpet plants in making out designs of exceeding beauty, of what use are they? Well, right or wrong, vulgar or otherwise, I do like to see a few good carpet-beds still, and there are two or three at Hampton Court that are charming. One has a green ground of *Herniaria glabra*, and consists of two balloons of gold, red, and crimson *Alternantheras*, with a pretty star in the centre, surrounded by small moons and crescents. This is a most striking design, and is cleverly worked out. Another is of a scroll or Malve pattern, having for centre a pretty and large Maltese cross. A third is of a totally diverse design, &c., but it needs ample room to describe these fully, and when done, no accurate impression is conveyed. In any case they, as does all the bedding, reflect the highest credit on the superintendent and his foreman, for the entire bedding display may be regarded as one of the most effective in the kingdom. *A. D.*

NEW OR NOTEWORTHY PLANTS.

PHYSOSIPHION LINDLEYI, Rolfe.

THIS species flowered with Mr. F. W. Moore at Glasnevin in April, 1892, and proved identical with a dried specimen collected by M. J. Linden, near Chiapas, Mexico, as long ago as 1840, which was confused by Lindley with his still imperfectly-known *P. carinatum*. It has larger flowers than the well-known *P. Loddigesii*, Lindl.; in fact, they are the largest known in the genus, measuring 7 lines long. The

sepal-tube is light-green, and the lobes orange-red, or brick-red, in colour (and so far like the other species). *Kew Bulletin*, 1893, p. 61.

BULNOPHYLLUM RACEMOSUM, Rolfe.

A Bornean species, allied to *B. anceps*, Rolfe, from the same country, but with much larger flowers. They are honey-coloured; the dorsal sepal and petals, also the lower part of the lateral sepals, are spotted with maroon, while the lower part of the dorsal sepals is striped with the same colour. The lip is purple with black dots. It flowered in the collection of Sir Trevor Lawrence, Burford, Dorking, in August, 1892. *Kew Bulletin*, 1893, p. 61.

CIRRHOPETALUM BRIENIANUM, Rolfe.

A Bornean species, introduced by Messrs. Linden, L'Horticulture Internationale, Brussels, with whom it flowered in March, 1891, and afterwards with Mr. J. O'Brien of Harrow-on-the-Hill. It is allied to *C. Makoyanum*, Rehb. f., and has the lateral sepals straw-coloured, and the rest of the flower maroon. *Kew Bulletin*, 1893, p. 62.

CŒLOGYNE BORNEESIS, Rolfe.

This also is a native of Borneo, and was introduced by Messrs. Linden, L'Horticulture Internationale, Brussels, with whom it flowered in August, 1892. It belongs to the small section *Flexuosæ*, and is allied to the Javan *C. longifolia*, Lindl. The flowers are light buff. *Kew Bulletin*, 1893, p. 62.

EPIDENDRUM LAUCHEANUM, Rolfe.

A distinct species, of the section *Spathium*, allied to *E. grandiflorum*, Lindl., introduced from Popayan by Messrs. F. Sander & Co. of St. Albans, with whom it flowered in November, 1889, and afterwards with Mr. F. W. Moore of Glasnevin. The peduncle is flattened, and, like the sepals and petals, light ochrous brown, sometimes dull purple-brown, and the lip glaucous green. *Kew Bulletin*, 1893, p. 62.

EPIDENDRUM TRICOLOR, Rolfe.

A Venezuelan species imported with *Cattleya Mossii* by Messrs. Hugh Low & Co., of Clapton, with whom it flowered in November, 1892. It is closely allied to *E. purum*, Lindl., but has an orange-coloured lip, by which it is easily distinguished. The sepals and petals are light yellow and the column green. *Kew Bulletin*, 1893, p. 63.

STANOPEA LOWII, Rolfe.

A handsome species, introduced from New Granada by Messrs. Hugh Low & Co., of Clapton, with whom it flowered last December. It is allied to *S. eburnea*, Lindl., and *S. Reichenbachiana*, Roehl. The sepals and petals are of a creamy-buff shade, the latter with some minute brown spots on the disc, and the lip ivory-white. The hypochil is globose, and the front of the lip shoe-shaped. *Kew Bulletin*, 1893, p. 63; *Orchid Review*, i., p. 117, fig. 12.

AËRIDES PLATYCHILUM, Rolfe.

A very pretty *Aërides* of unknown origin, which flowered with Mr. F. W. Moore at the Glasnevin Botanic Garden, in April, 1892. It is allied to *A. Houlettianum*, Rehb. f., but is easily distinguished by having a flat or slightly convex lip. *Kew Bulletin*, 1893, p. 64.

MILTONIA × JOICEYANA, new nat. hybr. (CLOWESII × CANDIDA).

A remarkably handsome *Miltonia*, the conformation of whose flowers leaves little doubt as to its hybrid origin. It is as showy as *M. Bluntii* and its variety, *Lubbersiana* (*Clowesii* × *spectabilis*), and a welcome addition to our garden Orchids. Its growth resembles that of a very stout *M. Clowesii*, and the inflorescence, which rises to a height of about 2 feet, bears flowers much as in that species, but the individual flowers are totally different, and bear distinct traces of *M. candida* in the broader segments and the ample labellum, which, although exhibiting the tendency to reflex on each side of the middle portion, inherited from

M. Clowesii, also exhibit in the notched, frilled, and upturned margin, a tendency to become convolute, as in *M. candida*. The sepals are clear yellow, heavily blotched with chestnut-brown, $3\frac{1}{2}$ inches from tip to tip at their greatest expansion, and half an inch broad, ligulate in form; petals similar in colour, but three-quarters of an inch broad, and more acuminate than the sepals, both sets of segments having a white base tinged with purple. The labellum is ovate, $1\frac{1}{2}$ inch broad in the front portion, the sides of the middle portion curving backward, so as to give the organ a pandurate appearance. The edges of the basal part of the lip are finely toothed, the front being notched and frilled, the edge curving upwards. There are two main ridges running up the middle of the base of the lip, with two lesser and shorter ones on each side of them. In young flowers the base of the lip is purple, the other part lilac, shading off to white at the edge, but as they mature, the lilac part gets an Indian-yellow tint, which is very charming. Column white, tinged with purple on the wings.

It is a fortunate plant, bought by Mr. Thorne for Major Joicey of Sunningdale Park, after whom it is named, at Messrs. Protheroe & Morris' Rooms, as *Odontoglossum ramosissimum*, so there is some virtue in getting a plant under a wrong name at times. It is Brazilian, I presume. *James O'Brien*.

TOURING IN KUMAON.

ON November 10, 1892, I left Ramghur for one month's outing, to the Himalayan snows. Travelling in Kumaon is so absolutely unlike anything in England, that I think your readers will not be uninterested in knowing how the journey was set about. In the first place, railways are quite unknown, so practically are wheeled conveyances of all kinds, so getting about Kumaon resolves itself into three methods, viz., walking, pony-riding, or the use of the dandy or jhampan. The latter is a curious-looking article, a sort of Sedan-chair projected into the middle of a miniature canoe; this is carried from the shoulders of coolies. It is of great value for ladies, children, and invalids, but no one with a good pair of legs would be seen in one of them; and so for healthy travellers the usual and best method is either walking or riding. For the latter purpose a Bhootea pony is usually selected. Wonderful little ponies they are too, usually about twelve hands high, and remarkable for climbing up the steepest of hills, over the roughest roads, and down semi-perpendicular hills with unerring safety. Indeed, they will carry twelve stone down places where it is difficult to stick in the saddle. They come from Bhute, the other side of the snows, in the direction of Thibet, &c. The Bhooteas are well-known traders, and frequently seen in Kumaon, but they are a Mongolian-like race of people, unlike the Hindoos in every respect.

I started with some eight extra-strong coolies, a cook, pony, a groom, three guns, &c. Of course my stores had to be made up with a view to lasting a month, and contained medicine in case of need, and a good double Cabul tent, and the usual odds and ends for roughing it in out-of-the-way places fifty to a hundred miles from European stations of any kind. Thus prepared, I left about 6 A.M. on November 10, in most glorious weather. Indeed, one of those brilliant cloudless months that you must come to Kumaon to realise in November.

From Ramghur Gardens you make an immediate and sharp descent of some four miles into the Ramghur valley, where there is a river, sundry villages, some cultivation of kinds. The natives grow several kinds of grain, such as Wheat, Barley, Rice, and two kinds of native grains called by them Maduwa and Kounee. I have to regret I do not know the botanical names of these two grains. The Maduwa is evidently a kind of Millet, and grows generally with three inverted claws [Can our correspondent mean Nepal Barley. Ed.] and is decidedly a taking-looking crop seen growing. It gives very stout and loog straw, and the grain from which they make cakes, &c. is highly appreciated by the natives.

The Kounee is something after the style of Wheat to look at, but very much longer in the ear, and generally curves inwards; the seed is shiny brown and of light straw colour, and very small for so large a plant. Here too, Water Cress is indigenous. I asked my servant what he called it, and he merely said it was a Tharkari plant, which is our way of saying it is a vegetable.

The road leads through the valley some 2 miles. During this distance the river is crossed, and we begin the ascent, the counterpart of the descent. There is nothing remarkable about the next 4 miles, the road is of the usual up-and-down character of Kumaon travelling, but on this particular occasion numerous villagers were what is familiarly known as "going down," that is, going down to the Jerai for the winter—and what a curious sight they present, simply hundreds of cows, goats, kids, buffalos, calves, &c., all promiscuously mixed up; meanwhile, men, women, and children, carrying fowls, ducks, pots, pans, and kettles, water-vessels, clothing, and innumerable odds and ends. They are decked out in dresses of almost every colour under the sun, and the road was full of dust from this motley cavalcade. After awhile we reached a small flat, in which there are numerous trees of the indigenous wild Pear tree, profusely covered with Mistletoe, well berried, too, even in November. Soon after, we reached the Peora Dak Bungalow, and call for a bait for breakfast, having done 10 miles. The Dak Bungalow is a kind of hotel, where you can stay for forty-eight hours for about half-a-crown, and take breakfast or any other meal. All the articles obtainable, and all the rates for the same, are fixed by the government; so if you know the vernacular language, no extortion is possible; but if you do not, woe betide you! The khansama (head servant) is a wily customer, anxious to possess the contents of your pocket. These places are simply furnished, and you must find your own bedding in all cases, but this is so well understood, that nobody travels without bedding. Dak bungalows are an invaluable institution in Kumaon. After two hours' rest, we moved on for Almora, the dingy little capital (civil) station of Kumaon. A station is the usual term for a European or government settlement in India. Some half-hour after moving off from Peora, we came across a great lot of the brilliant parakeet birds, called tuti by the natives, screaming, and making the place resound with their noises. These birds are very fond of acorns, and as there were plenty in this neighbourhood, this was presumably the reason they were here in such quantities.

Travelling some 2 miles, we again came across more Mistletoe, and shortly afterwards came to a large Pine forest. Some 3 or 4 miles through this Pine forest leads down to a river of respectable size, on the opposite side of which is an enormous range of more or less barren rocky hills, here and there dotted about with Pine trees and a common indigenous Cactus, ranging from 5 to 15 feet high. This river has to be crossed, and we immediately begin a long winding ascent of some 5 miles into Almora.

On the road numerous plants of a brilliant Lupin (yellow) were noted, some in full bloom, others in full seed, and some beautiful grasses were in evidence too, notably a pure soft white grass, with a kind of knotted inflorescence growing, I noted, only in the driest of rocky places. This is a very chaste and charming grass, by no means plentiful, I gathered some blooms, but could not find a single seed in it.

As you near Almora there is a partial avenue of the Tallow-tree, so-called. What is the name of this tree? It bears soapy or greasy seeds of a tallow-coloured white.

ALMORA.—Eventually we sight Almora, and soon get within the compound, and the first most unfortunate thing that strikes one is the Leper Hospital, close to the station. This hospital is surrounded with very good Deodars, and looks rather a charming place from the outside. But fancy planting such a place within the very bounds of the station; this has been so very often and severely commented upon, I say no more about it. In the course of half an

hour we come to the mall of Almora, and the first striking thing that catches a gardener's eye is the shop of Lalla Sham Lal, with a pretty Bougainvillea glabra running over the top of the building; and some 30 feet up, a tree in the immediate neighbourhood of the building, and profusely in bloom.

We reach the Dak Bungalow in about five minutes, and a real melancholy seizes one on surveying the barren, treeless place; this is technically the capital of Kumaon, but a more dreary, barren place, can scarcely be imagined. Nevertheless, it is a warm dry place, with a small rainfall, and invaluable for certain classes of sickness contracted on the fiery plains of India.

The next morning we moved off about 6 A.M., for Bageswar, some 26 miles distant; the first 4 miles of road is round a winding hill, and as one reached the ridge, Almora looked really fascinating in the distance with the white-looking boogalows interspersed with Deodars. This is undoubtedly the best side to see the station from.

Having reached the ridge in question, which is some 7000 feet in elevation, we make an equally long descent, during which Binsar, the former residence of General Sir H. Ramsey, was clearly seen in the distance at some 8000 feet elevation. Sir Henry was for nearly half a century the ruling genius of Kumaon, and was not unfittingly called the King of Kumaon. From every side one heard a good many tales of the brilliant General whose work was more civil than military, but he had a fine combination of the iron hand beneath the velvet glove. The general possessed the finest collection of Apples in all India, his method was to root up any kind that did not succeed, and by constant adding during something like forty years, he succeeded in getting a really grand lot of Apples that do well in India. I hear, however, at this date that the real demon of Kumaon, viz., hail, has played great havoc with the fruit this year, as it has in so many other places in Kumaon. *F. W. Sears, Ramghur, June 25, 1893.*

(To be continued).

PLANT NOTES.

COLOCASIA ANTIQUORUM.

This is an old-fashioned foliage-plant, with large dark green leaves, which accommodates itself to cultivation in rooms, and is an object of beauty on the table, in vases, and aquaria—not directly in the water, but on the margin. It is not very particular as to soil, and succeeds capitally in a mixture of charred earth, peat, leaf-mould, and sand, and the drainage should be sufficient, but not excessive, in amount. The leaves are ovate, more or less peltate, 1 foot or more long. It is a more satisfactory plant than most Palms, Dracenas with coloured leaves, Caladiums, or Ferns, for the living-room, a quick succession of leaves forming during the summer.

COLOCASIA ESCULENTUM.

This has peltate-cordate leaves of a dark green colour, and when it has plenty of nutriment they attain a large size. The plant is excellent for rooms if afforded the same kind of treatment as the foregoing. Both of the above may, in winter, have all their leaves, except the central ones, cut off, and be stored, partially dry, in a greenhouse, or better, in a house where the temperature is not less than 50°. The pots should not stand on shelves or other dry places, but rather on an earthen floor.

FRUIT AT BARHAM, KENTISH COURT.

THE fruit crop at this well-known garden is again abundant, and the remark applies almost equally to all varieties. If there is an exception, it is the Plums, which are not quite so plentiful as they usually are. Pears are a good crop, though they may not reach the weight of last season, when some of them turned the balance at 1 lb. 11 oz. The Apples, however, form the greatest feature of the establishment; at no other place do we remember seeing such

excellent Apples as Mr. Geo. Woodward produces here in the open, and if they are gathered and dished for exhibition, the general opinion of them is that they are from the orchard-house. Nor are we surprised, for they grow to an immense size, of the most perfect shape, and with skins delicate and clear, and possessing a bloom such as is but rarely seen upon Apples in the open air. Alexander, for instance, a good old variety, but one which in the greater number of gardens is seen with a scab or two upon the skin, is here as free from any such defect as other varieties, and what a very pretty fruit it is! Peasgood's Nonsuch becomes everybody's nonsuch, and Mère de Méange attains a remarkable colour. Washington does well outside, and Bedfordshire Foundling comes to very large size. There are no Apples or Pears under glass, and this may perhaps be borne in mind with advantage by any who may happen to see these fruits exhibited from the establishment during the coming autumn. If Apples are a feature here, the same must be said of the Peaches, for where are there finer crops of better quality produced inside or out than here?—and last year were gathered more than 13,000 fruits. The trees outside upon the walls—and they are many—are trained with as much care as those inside; in fact, the cultivation is just the same for both, and the results show but little difference. This can be said of few places, we are afraid; but in how many gardens would it pay to expend the same time and care on outside Peaches as on those inside? only in highly-favoured places, we imagine. Some trees on a west wall are quite a success, but no doubt this can be done in most of the southern counties. The trees are syringed twice a day regularly, and there is no red-spider; for upon the faintest sign of this enemy, the shoots affected are sponged. Thinning of fruit is practised upon all trees thought to require it, whether they be Apples, Pears, or Peaches. Mr. Woodward is evidently a fruit specialist, and he understands the subject thoroughly; if he is short-handed, then the trees and crops receive his first attention, and should anything suffer, or be put off a short time, it is the upkeep, which he would be apt to allow to lapse. Does this sound like the tactics of an untidy gardener? We think not—at any rate, Mr. Woodward's place has not that appearance; and if a gardener has strong sympathy with his trees, it is pain for him to see them want for anything.

Of the Peaches inside, those that more especially call for remark are the standard trees in a span-roofed house; here the crop was marvellous, and the Peaches of first-rate quality. Asked if he liked this system best, Mr. Woodward replied in the affirmative, and gave three reasons for doing so—1, a greater number of Peaches of equally good quality can be grown in the same area; 2, the labour necessary is not so great; 3, the fruits—which ripen at the tops of the trees first—come in a better succession, and the season of each variety is very much prolonged. His experience is, that the fruits are of equal flavour to those grown on trellises, and they colour quite as readily, even those towards the bottom of the trees. We have heard the same testimony with equal earnestness from Mr. Burton at Bexley Heath, another noted Peach-grower, and so we are led to ask why this system is not more common than it is? Of course one condition would be requisite, viz., that the house, instead of being a lean-to, must be built with due regard to the accommodation of standard trees, and if such were done, it certainly seems that the result would justify the departure. At any rate, it is a pretty sight to go into one of these standard Peach-houses, either when in bloom or when the trees are ripening their fruit.

A very unusual circumstance may be noted here, and one which may, perhaps, have an influence in the general success secured with trees inside and out. The whole water supply is from the River Medway, and it is brought through pipes which run right along the tops of the garden walls, and exposed to the full rays of the sun. In the summer-time, therefore, when a quantity of this is required for watering and

for syringing, it is quite warm. In regard to pruning, we are not surprised to find Mr. Woodward favouring the extension system rather than severe pruning. His soil and climate are such that the trees do not require so much cutting as other districts render necessary. He, however, prunes a little if the trees are bearing too freely, and producing small fruits; but if the trees are growing well he "lets them get away, but thins the branches," believing that if he cuts them unduly, they would make more wood and in proportion to the extent the knife was used.

These are a few remarks written after a hurried visit to one of our best fruit gardens, and to one of the most genial and hospitable of gardeners.

SWEET-SCENTED CLEMATISES.

Of our type species of *Clematis viticella*, *patens*, *florida*, and *montana*, the latter appears to be the only one that can claim to be fragrant, and the wonder is that quality alone, apart from its wonderful floriferousness, does not secure for it an extended cultivation. This highly ornamental and free-growing hardy Indian climber is, to quote from Jackman and Moore's *Book on the Clematis*, "well adapted for training over walls and trellises where a considerable space requires to be covered. In fact, the more freely the plant is allowed to grow, the more ornamental it becomes, on account of the greater profusion of blossoms produced when well established; it will grow from 20 to 30 feet in a season, while every joint will bear blossoms as white as snow, in wreaths from 10 to 20 feet long. The blossoms are so copiously produced, several springing from each axil, that the branches literally become converted into floral garlands." This species has received the name of *C. odorata* from the sweet perfume dispensed by its flowers, and it has also been called *C. anemoneiflora*, from the resemblance borne by its flowers to those of the wild Anemone.

C. Jackmanni, and the varieties bearing its character, appear to be wanting in fragrance, or if they possess it, only in a limited degree; nor has this quality been prominent in *C. lanuginosa* and its progeny. But some crosses made at Woking twenty years ago by using the pollen of *C. patens*, *C. Fortunei*, *C. Standishii*, and *C. Sophia plena*, all of which partake of the *patens* character, being early-flowering, or to *C. Jackmanni*, *C. rubella*, *C. rubroviolacea*, and *C. magnifica*, the intercrossings being also reversed, gave a progeny, one portion of which followed the early-flowering parents of the *patens* type, while the other portion partook more of the character of the late summer-flowering parents of the *Jackmanni* race. Some of the early-flowering varieties which came from these crosses, more particularly *C. Fair Rosamond*, *C. Edith Jackman*, *C. Maiden's Blush*, *C. The Queen*, *C. Stella*, and *C. Vesta*, proved to be remarkable for their strong and agreeable fragrance—something intermediate between Violets and Primroses—which they exhale when in a warm, sunny atmosphere, and which is most pronounced in *Fair Rosamond*. It is found also that the odour varies; in the cases of *Fair Rosamond*, *Edith Jackman*, and *Maiden's Blush*, the perfume is that of the Violet; in the cases of *The Queen*, *Stella*, and *Vesta*, that of the Primrose. It is supposed that the quality of fragrance was originally derived from *C. Fortunei*; the flowers of this double form, which was introduced by the late Mr. Robert Fortune from Japan, have a slight and agreeable fragrance, like that of the Orange-blossom.

In reference to the culture of these fragrant Clematisses, it should be borne in mind that as they partake of the character of *C. patens*, they bloom early on the ripened wood of the previous year, and not like *C. Jackmanni* and its allies—on the young wood of the current year. This is a distinction it is most important should be borne in mind; therefore, pruning is of the first importance, and it should consist in cutting away the old wood which has borne flowers in the previous spring, and weak, straggling, and over-crowded growths. Whether the plants be trained to pillars or against walls, the

strong one-year-old wood only should be trained in as far as it has become thoroughly ripened, as it is this will produce flowers the following spring. Pruning is best done in February or March, after danger from hard frost has passed away. *R. Dean*.

COLONIAL NOTES.

BOTANICAL STATIONS.

(Continued from p. 180.)

TRINIDAD.

To effect the transport of plants to foreign countries, the botanical staff of a colony must possess, not only an accurate knowledge of the countries themselves, but also of the routes traversed by railway or steamer, for unless the climatology of a country is known, it is hardly possible to make successful introductions of suitable plants either to or from such a country. For instance, we as yet know little or nothing of the climate of New Guinea or Western Australia. The meagre information given in the Colonial Office List, being utterly inadequate for our purpose, as only the mean for the year is given (65° Fah.). Between Jamaica, Mauritius, and Trinidad, we are better able to institute a comparison, as meteorological statistics are regularly kept. In the matter of climate, both Mauritius and Jamaica have an advantage over Trinidad in having a greater range of temperature in the inhabited districts—the hill temperature being the cooler. The average rainfall of Mauritius is 47.98 inches, while that for Trinidad equals 65.91 inches annually. The average temperature for the year 1890 at Mauritius was 72° 2', while the mean annual of Trinidad showed 77° 5' Fah. In some of the hill districts in Jamaica the mean annual temperature is 63°, in Mauritius 67°, while in Trinidad our hill temperature is not recorded, which makes Trinidad compare unfavourably with those countries in such returns.

It will be seen, therefore, that temperature in many respects reveals the character of a flora, and, together with the relative humidity, wholly determines it. It is not enough to say such a thing grows in Jamaica, it should grow in Trinidad. Such a thing grows in tropical Australia, it should also grow here. No inference that can be drawn could possibly be more deceptive. We want to know from what part and what elevation a plant comes, and the special meteorological condition of that part, before we can even "begin to form an opinion" as to whether a plant thriving in one place will thrive in another to which it is introduced.

In England, for many years, several plants introduced from Jamaica were (because they came from Jamaica) put into tropical hot-houses, and, as a result, the plants died consignment after consignment; but when the climatic condition of that portion of the island was known to the English cultivator, the case was altered, and the plants could be readily and easily grown with the appliances at their command. Conifers will not grow on the south side of Jamaica; in Trinidad, they do fairly well. The cause is readily apparent to those interested in the matter, in the difference of the climatic conditions; although in this case the temperatures are similar, almost to a degree, yet the relative humidity is totally dissimilar.

Successful gardening in the Tropics almost entirely depends upon the introduction of plants from a suitable or similar climate; and although there are a few ubiquitous plants which appear to thrive under the most contrary conditions, the majority of plants will only thrive in similar climatic surroundings as prevail in their native country. The Rose, we know from English practice, stands "forcing" well, but there are varieties which are useless for that purpose. Those varieties it is useless to introduce to a climate like that of Trinidad, as they will produce little else but leaves. In fact, to grow the Roses at all, means constant renewal of plants, and renovation of the soil in which they grow; and those varieties which stand the process of "forcing" in hot-houses out of their season in Europe are those best suited for tropical culture—the sweet-smelling "hybrid perpetuals" of English gardens being well-nigh useless. It will thus be seen how much depends upon the science of meteorology, and how important it is that continuous and accurate records should be kept. *J. H. Hart, Superintendent, Trinidad Botanic Gardens.*

HONG KONG.—The usefulness of the Botanical Department as a centre for the distribution of information and advice is, says Mr. Ford, constantly availed of by local correspondents, and others in China and all parts of the world. It is sometimes a tax to attend to the correspondence, but at all times, when it is possible, inquiries are cheerfully replied to, even when nothing is gained in exchange, as it would be discourteous to leave such communications unattended to.

THE SUGAR-CANE IN NATAL.

On this subject, which is of importance to the colony, we have received intelligence from a most trustworthy source, and to the effect that the cultivation of Sugar is advancing by "leaps and bounds," and the prospects are very encouraging. Prices are higher by some pounds than they have been for

years past, and the increase in the exports to the Transvaal, which draws supplies from Natal, gives assurance of a largely increased demand on the spot. Manufactories are being established on the central mill principle, under which growers dispose of their canes to the proprietors of these manufactories, which is found to be the best because most remunerative system. In other things the colony is advancing, stimulated doubtless by the rapidity of transit between Cape Colony and Johannesburg since the completion of the line of railway—bringing London within three weeks of the mining fields.

VEGETABLE FIBRES IN UPHOLSTERY.

Since the appearance of our note "Stock-taking for May," in which mention was made of the high prices realised for silk, vegetable fibres have come to the front with a rush, and there has been a large demand for woollenised jute and China-grass as well as worsted for upholstery purposes. Of course, as a result, silk has fallen, but doubtless a large quantity of fibre will be used up in goods for decorative and other purposes. It ought to be more widely known than it appears to be that these vegetable fibres will not stand cleaning—that when faded they can only be renewed by substitution of new stuffs. More than this, when silks, jute, and worsted are mixed, they expand and contract unequally, and a rough surface is too often apparent where a smooth one is to be desired. This brief note may be found of use by readers contemplating fresh interior decoration. Of course, price has something to do with mixture; but the tradesmen ought to know what mixtures are least pernicious, as well as most effective and cheap.

NEW INVENTION.

AUTOMATIC TEMPERATURE RECORDER.

THESE are now in operation on board two steamers making their way to the Antipodes, and on a bench in the mezzanine floor of Messrs. Negretti & Zambra's Sale-rooms in the Holborn Circus, specimens of the Temperature Recorder, designed for use in the coal-room of ocean-going steamers, designed and manufactured by the firm just mentioned. In May last (p. 626) we drew attention to this matter, and a reference to that short article will spare further introduction. The instrument has been on trial at home for some five or six weeks past, and the trial—of which we have seen the evidence—is so far very satisfactory. The instrument is a very simple affair. A finely-executed piece of clockwork, which runs for eight weeks, carries on its periphery a strip of paper, scaled to degrees, and parts of degrees if requisite. So long as the mechanism moves, just so long does this cylinder rotate and receive the impress of the stylus or pen. All this is contained in a nearly square wooden case, one side—that adjacent to the pen—being formed of glass (for purposes of observation, as understood). The top of this case is movable, and is hinged, so that the cover cannot be removed. The whole, when fixed, is securely locked, and thus the record cannot be tampered with. But how is the pen actuated? Outside the case is a bulb and tube filled with a liquid whose ingredients are prepared by the firm already noted. As this liquid contracts or expands, a clever adaptation of levers connected with the stylus is got in motion—the record is completed! So from day to day this quiet bit of work is carried on in silence and darkness; and the engineer outside, whose duty it is to attend to the temperature of the cool-room—to the withdrawal of warm and the substitution of cold air—is quite aware of the proximity of this truth-teller, and makes further endeavour, if that be needed, to do his duty. At the end of each voyage both logs—the silent automaton and that kept by the engineer—will be compared in connection with the cargo stored in the cool-room; and all this must tend to the profit of the importer and of the consumer at this end of the voyage. There is always a

"but" or an "if" in all human affairs and contrivances; and the present is no exception. If the oscillation of the ship in any way affects the working of the recorder, then it will have to be swung from a ball-and-socket joint or gimbal, to ensure steadiness; and to prevent the necessity for a sudden injection of cold air into an atmosphere in excess of what should be its normal degree of heat, the inventors of this contrivance should go a step further, and furnish a tell-tale for those responsible in the matter of temperature. Not but that there are ways and means now in existence, but these must be severely taxed in steaming through tropical seas. It may be further noted that the tube containing the fluid, being exterior to the case, requires some sort of simple but strong protection—just to save awkward consequences of something breaking away, and tapping or breaking the bulb. The subject is an important one for all connected with the fruit trade of the Antipodes, and with the import of agricultural produce from our colonies, near and far, and this must be our excuse for drawing attention once more to this subject.

AZOLLA.

SOME time since we were favoured by Mr. Greenwood Pim and by Mr. Burbidge with specimens of an Azolla in fruit which excited much attention. The species is *A. filiculoides* of Lsamarck, a species having an extremely wide distribution—nearly from one end of America to the other on the Pacific side. The plant is a pretty little aquatic, looking like a moss or a Selaginella floating on the surface of the water, and throwing down into the water straight, thread-like roots, which in the young state have a root-cap which disappears as the roots increase in age. The stems branch in a pinnate fashion, and bear four rows of numerous densely packed leaves of an ovate shape, pale green, and often flushed with a delicate shade of pinkish-brown and of velvety texture. Each leaf has a rather thick cushion-like pad of cellular tissue in the middle which facilitates floating. The leaves are described in all the text-books as deeply bifid, but they divide so very deeply that the lobes may well be mistaken for separate leaves. Moreover, the base of each leaf, as it grows, becomes hollowed out into a cavity, easily seen on making a section of the leaf.

In the axils of the leaf towards the base of each shoot are found the "sporocarps," or as we may loosely term them the capsules (see the arrows at fig. 37, n). These are of two kinds, the one, e, ovoid-acute, and considerably larger than the other, c, which is oblong, cylindrical, and acutely pointed. Not infrequently the two kinds of capsules occur in the axil of the same leaf. The larger of the two capsules e, contains a mass of stalked subglobose spore-cases (sporangia), shown at f, as magnified thirty times, and one of which is shown isolated at g. When these are opened, or burst open by pressure, an infinitude of minute globose spores (microspores) are seen frequently massed together into ovoid groups (massule) n, from the surface of which project hyaline threads bearing at the extremity an harpoon-shaped process, j. The lower part of the thread is hyaline and translucent, whilst the harpoon-like portion is separated from the supporting thread by a septum, as shown in Mr. W. G. Smith's drawing, as if the contents of the thread had passed wholly into the harpoon-like portion. The smaller Pear-shaped capsule, c, d, contains a single spore—the megaspore. The larger capsule, e, is comparable to the indusium of a Fern, such as *Hymenophyllum* or *Trichomanes*, but whereas that is open at the top, it is closed in Azolla. The stalked spore-cases, f, g, are analogous to the sporangia or spore-cases of the Ferns, probably to the anthers of flowering plants, and the small spores are the equivalents of the small spores of Selaginella or to pollen-grains. What the harpoon-like bodies may be is not known with certainty. At any rate, when the spores are detached and floating on the water, these harpoons are serviceable in hooking on to the female spores.

The larger sporocarp e, thus contains the microsporangia, f, g, and these in their turn contain the microspores, n, with their harpoons, j. The smaller sporocarp, c, is Pear-shaped, and contains a single megaspore, d. This is all that can be seen in the specimens before us, but those who have watched the further stages of the process, describe the microspore as producing a single antheridium, and the female megaspore as of complicated construction, ultimately buoyed up on the surface of the water by a tuft of fine threads, the analogues of the harpoons of the

FIG. 37.—AZOLLA FILICULOIDES. A, Plant; B, the same magnified 3 diam. (the arrows point to the position of the sporocarps); C, a female sporocarp; D, section of the same, showing immature megaspore; E, male sporocarp; F, section of the same, showing the microsporangium; G, a stalked microsporangium, isolated, magn. 100 diam.; H, group of microspores, with their "glochids" or harpoon-like processes; I, glitchid separate, magnified.

microspore, and giving exit to the prothallus bearing the archegonia. The male spores hook on to the female spore and prothallus by their harpoons, and thus fertilisation is effected.

Those who wish to pursue the subject further should consult the ordinary text-books, and the classical memoir of Strasburger, *Über Azolla*, Jena, 1873, p. 78, tab. vii., figs. 109—111, and *Martius Flora Brasil.*, vol. i., pt. ii., p. 658, t. 82. Quite recently, too, Professor Douglas Campbell has published (in the *Annals of Botany*, June, 1893) a paper on the development of *Azolla filiculoides*, which is of high importance. In it the Professor calls attention to the close resemblance of the megasporangium, c, to an ovule in its mode of

development. As the chief interest in these plants consists in the evidence they afford as to the possible lineage and interconnection of the various groups of flowering and flowerless plants, this resemblance is specially significant.

Another interesting feature should be mentioned in the constant presence of threads of an Alga *Anabaena* in the cavities of the leaf; whether this "commensalism" is mutually advantageous is not known. *A. nilotica* is beautifully figured and described by Mettenius in the *Plantae Tinianae*, as far as his material allowed. It is refreshing to consult his clear concise diagnosis and subsequent comment, and to compare it with the long-winded dissertations of some modern writers on Cryptogams, especially Germans, where one may read, or try to read, page after page without being able to grasp any definite meaning, or obtain any precise or comparative statement. Before being enabled to recognise a particular plant, one is plunged into the subtlest mysteries of its mode of life, to follow which at first hand is necessarily reserved for the few. Of course these are matters of extreme importance, but the student requires first of all to be able to recognize what he sees, and to gain some general knowledge of the plant as a whole before working out the details.

AMERICAN CONIFEROUS FORESTS.

At the Nurserymen's Convention, held in Chicago recently, Mr. Robert Douglas read a paper, from which we take the following extracts:—

HALF A CENTURY AGO.

I well remember sailing up the St. Lawrence in May, 1836, when in sight, for the first time, of an indigenous evergreen forest, saying to myself, "Well, now I can ramble in the woods to my heart's content! No gamekeepers here! No finger-boards, cautioning me to beware of man-traps and spring-guns!" We reached Quebec May 21, in the midst of the spring fleet, for even at that early day vessels came from Great Britain—coming in ballast, and going back laden twice a year with lumber, which was brought from the interior in rafts to Quebec.

In 1837 I travelled from Quebec to Niagara Falls, and forests were everywhere in sight. Farmers were girdling the trees and growing crops among the gaunt dead Pines, which looked like goblins on a moonlit night.

On my way to Vermont in 1838 I saw fields fenced with White Pine stumps, only a little way east of Troy, New York. East of Bennington, Vermont, they were cutting down the timber and making it into charcoal. On the east side of the Green Mountains farmers were felling the trees in wind-rows and burning them. During the spring of 1844 I travelled through virgin forests in Michigan, and at that time the northern part of that State was covered with White Pine, and the same was true of northern Wisconsin, the Michigan peninsula, and Minnesota, and I never imagined that lumber, especially Pine lumber, would ever become scarce in this country; but when I travelled to the Pacific coast in 1849, and passed through more forest in the first four miles from the shore of Lake Michigan than I found all the rest of the way to the base of the Sierra Nevada Mountains, I became convinced then that the time was not far distant when the country would regret the wholesale destruction of its noble Pine-forests. In 1863, and many years since that time, I have travelled in Colorado and other far western States, and many magnificent coniferous forests, but the axe and the fires have destroyed them, and valuable species will never grow there again. For several years I have longed for a sight of such forests as I saw long ago, but was not gratified until last year, when, in company with my son, I spent the late summer and fall in the forests of Washington, Oregon, and northern California. We spent day after day for two weeks around Puget Sound in the immense forests, where the trees were 100 to 200 feet taller than the tallest trees on the Atlantic slope. Here history is repeating itself, and

I was laughed at for my forebodings, as I had been laughed at on this side of the mountains a generation ago.

THE FUTURE.

Where will you find your coniferous forests on the five-hundredth anniversary of the discovery of America? My belief is that they will stand where the forests have been cut down and burned over, for Nature is more provident than man, and will do the best she can; but the Conifers that Nature will produce in these burned and desolated regions will be neither ornamental nor useful. The same fires that sweep away every vestige of trees and seeds of the valuable evergreens open the persistent cones of the scrub Pines that hang unopened for fifteen years at least, according to my observation, waiting for, what is to them, the friendly fire. The Wisconsin Gray Pine (*Pinus Banksiana*) is already taking the places of the nobler Norway and White Pines. *P. contorta* is covering the burned lands in Colorado and the burned Pine lands in the Rocky Mountain districts, and other species of worthless Pines occupying the burned Pine lands both in the far-west and in the south. But even these worthless Pines have to fight with other comparatively worthless trees for a foothold, for the Aspens and other Poplars, the Birches, and like kinds, producing seeds that are carried long distances by the winds, find the burned lands in the finest condition for germinating delicate seeds, and divide the land with the Thistle, which delights in burned land.

Darwin says the Oaks are driving the Pines to the sands, but without forest fires the Oaks would make little headway. There are Oaks in every Pine forest that I have explored—fires cannot destroy them; they are gaining ground continually, so far as my observation goes. There are other causes operating against valuable evergreens. Nature has a vast family to feed, aside from producing seeds to continue the species. Passenger pigeons, mourning doves and other birds, and squirrels must be fed. The White Pines produced millions of seedlings when bearing trees were in plenty; the birds are taking all the seeds where the trees are scarce.

Then again, evergreen trees with delicate foliage are not able to compete with the coarser kinds; they are scorched and killed if the sun reaches the seedlings the first year, and they damp off if in too deep shade. I noticed this especially in East Tennessee and in North Carolina, where I had abundant time and could see the advantage the Old-field Pine had with its coarse foliage.

SCARCITY OF SEEDLINGS.

While passing through a forest of *Pinus Lambertiana*, the large Sugar Pine, I noticed that the seedlings and young trees were remarkably scarce, while seedlings of other species, not devoured by birds, were creeping in around the edges in vast numbers. The old trees were bearing in quantity huge cones, 10 to 15 inches long and 12 inches in circumference. Squirrels, wild pigeons, and Clark's crow were feeding on the seeds. The cones hang from the utmost point of the upper branches, bending the limb with their weight. The large squirrels go from branch to branch, cutting off the cones, and then gather them together, to be broken up at the base of the trees, and leave, in many instances, a bushel of cut-up cones at the base of the tree, without a single seed that I could find.

In my rambles through the Redwoods I noticed the great scarcity of seedlings; indeed, I never found ten seedlings in a six hours' ramble, except where there had been new cutting and filling on a narrow-gauge railway. Examining the seeds carefully, I found ninety-eight per cent. abortive, but this tree has an advantage over all other Conifers, in throwing up a circle of young trees around the base of each cut-down tree, and is therefore better prepared to hold its own than any other Conifer with which I am acquainted. When we reached the groups of Brewer's Spruce, *Picea Breweriana*, the scarcity of seedlings and small trees was remarkable, but the next morning fully explained the cause. Squirrels were busily employed cutting off the cones.

Grossbeaks and crossbills were tearing the cones, and the little snowbirds that are so troublesome on our evergreen seed-beds were picking up the scattering seeds. Now, since all of these trees known to exist do not number over one hundred, in what other way can we account for the scarcity?

Yes! on the five-hundredth year of the discovery of this continent there will be choice evergreens in America, but, like the buffalo, the elk and the antelope, they will be confined to public parks and private grounds. *Garden and Forest*, June 14, 1893.

TREES AND SHRUBS.

SPIRÆA LINDLEYANA.

This is one of the finest of flowering shrubs, judging from an example to be seen in the grounds of Gunnersbury House, Acton. It is quite hardy and in summer sends up strong shoots, which produce white flowers in large drooping panicles, which are abundant and highly ornamental, and they are followed by pinkish fruit, which hang a long time. The stems are apt to die down, but when they do so they are replaced by vigorous shoots sent up from the roots. Attempts have been made to grow it in an arborescent form, but it does not appear to retain the character, its natural habit being shrubby. Mr. Hudson's specimen is a very fine one. *R. D.*

THE VARIEGATED HYDRANGEA.

I am surprised this attractive plant is not more grown for greenhouse and conservatory decoration. Under glass it comes beautifully variegated, the white of the purest, and then it is singularly effective. I have two good-sized plants of it; one stands in my forecourt garden on a north aspect, where little sun comes, but the variegation is almost absent; the other in a house which catches the full sunshine is the very opposite. Young plants in particular become finely and distinctly marked, and can be employed with excellent effect. Cuttings should be taken only from the most perfectly variegated shoots. *D.*

HOW FOREIGN PLANTS CAME TO EUROPE.

In recent numbers of the *Gartenflora*, Professor Kraus writes instructively with regard to "The Peopling of Europe with Foreign Plants." Up to the middle of our century, four distinct and important periods in this work may be distinguished.

The first dates from the earlier half of the sixteenth century, when German botanists began systematically to take account of all the native plants of their country, the Venetian Government established a great garden in connection with the University of Padua, and similar gardens were quickly formed in other parts of Europe with the express purpose of collecting, in a single spot, as many foreign plants as possible. The catalogues of these early gardens have remained for three hundred years the chief source of information with regard to the first introduction of exotics on a large scale. The catalogue of Gesner, published in 1560, names 1106 garden plants, and may be checked by comparison with an accurate account of the plants grown in the most famous of contemporary establishments—the medico-botanical garden at Nuremberg, with which the names of Camerarius and Jungermann are associated. The contents of such sixteenth-century gardens, says Professor Kraus, may be understood by studying to-day the peasant gardens which lie far from cities, or, still better, the well-tended garden of some old-fashioned rural apothecary. There, in the secluded country, the horticulture of earlier centuries is as characteristically preserved as the fashions in dress of the people.

Just when garden plants thus began to be systematically studied, appeared that new material which entitles this to be called the first great period of plant introduction. Just then oriental bulbous plants were brought to Europe in large quantities.

A definite date for southern Germany is given in the record of the first bringing of Tulips to Augsburg, in April, 1559; and with the Tulips came Hyacinths, Narcissi, Anemones, Ranunculuses, and more besides. They were brought in chiefly by way of Vienna, but through the agency of Netherlands merchants who had settled there, chief among these being Clusius; and it was in Belgium and Holland that the love for them became most pronounced, rising during the seventeenth century into the rage of the "Tulip mania," and persisting to-day as a serious, sensible, and highly-productive commercial tendency. In Germany the garden most fully furnished with these new treasures was that of Von Gemmingen, Bishop of Eichstadt, and in Paris that of the famous Jean Robin, which was uncommonly rich in Lilies, Narcissi, and Tulips.

With the opening of the seventeenth century, the second great period of plant introduction began. Jean Robin's name is especially connected with this period—with the introduction of North American (or, as they were universally called at that time, Canadian) plants. The ancient Locust tree (*Robinia pseudo-acacia*), which still stands in the Jardin des Plantes, and was the first to be grown in Europe, celebrates his name and deeds; and in 1635 his garden furnished material for a magnificent work in which forty new American plants were portrayed and described—all of them now thrice-familiar species to the frequenters of European gardens. These American plants came into Germany chiefly by way of Basle, where Bauhin possessed their seeds as early as 1622; but they crept very slowly northward. The Wild Grape-vine, for instance, known to Robin and Bauhin early in the century, is noted in the University garden at Leipzig only in 1683, and at Wittenberg not until 1711.

Meanwhile, Dutch colonists had settled in S. Africa, and the middle of the seventeenth century marks the opening of the third great period of plant-introduction, when the varied and beautiful flowering products of this region found their way to Europe. The first account of them is in the catalogue of Schuylys, published at Leyden in 1668; and the Leyden garden was enormously rich for the time in plants of all sorts, especially a little later, when Boerhave was its director, and it contained 6000 different species. The garden at Amsterdam rivalled it, however, and Professor Kraus asserts that no single garden has since furnished material for the account of so many plants as were described by the Amsterdam botanists, the Commelins, in their great folio works. The introduction of Cape plants, many of them incapable of supporting a northern winter, was a prime factor in the rapid improvement of hot-houses; while the ease with which they could be produced, and their intrinsic attractiveness, caused them to spread through Europe with great rapidity.

But in the next century a novel artistic movement gave a great impetus to the importation of another class of plants, and thus inaugurated the fourth great period of plant introduction. This movement was the change from the old formal, architectural method of park making to the free, naturalistic, so-called landscape method. Now, in Professor Kraus' words, the horticulturist's main object was "to embellish his landscapes," and for this purpose neither small flowering plants, nor tropical, alien-looking plants of any kind, could serve him best. Hardy trees and shrubs were wanted, and for these he turned to North America again. Europe had become perfectly familiar with many of its finest arboreal products—as with the Locust, the Tulip tree, the various Sumachs, and the Hemlock. But hundreds of others were now added to the list, including the White Pine, Spruces, Firs, and the Bald Cypress, the American Oaks, Maples, and Poplars, the Occidental Plane, the red-flowering Horse Chestnut, Nut trees, Thorns, and the Calycanthus. "Not inaptly," says our author, "are these American trees distinctively called in Germany 'fine park trees'; for in the variety and dignity of their spray, in the form and arrangement of their leaves, and in the shading of their normal and their autumnal colours these Americans have not their equals with us."

Moreover, as these American trees and shrubs were being lavishly introduced, others of similar value to park-makers were being brought from Siberia, and the newly-opened regions of eastern Asia. Siberia sent especially Honeysuckles, Spiræas, and small-fruited Apples, precious for their vernal bloom, but even exceeded in this respect by the flowering splendours of the immigrants from eastern Asia—the Weigelas, Forsythias, and scores of other plants which Europe began to receive about the middle of the century.

Of course, since this time vast treasures of every sort have been added to the European horticulturist's lists, not only from the regions already named, but also from the western coast of North America, the Australasian islands, and the tropics, these last especially enriching our hot-houses, since the present passion for exotic Orchids developed. Nevertheless, by the middle of the century those quarters of the world had been thrown open whose products were radically to transform the aspect of European gardens.

It would be difficult to compute with accuracy the total number of foreign plants now grown in Northern Europe, every year adding, of course, largely to the enormous total. But to give some idea of what this total now may be, we may quote Professor Kraus' statement that, while some 1500 flowering-plants are believed to be natives of England, Sweet's *Hortus Britannicus* names as growing there in 1830 some 32,000 species. This means that even sixty-three years ago, before the prolific labours of the last two generations of explorers and importers, more than twenty-two plants had been introduced by man into England for one with which Nature had there supplied him. *Garden and Forest.*

DIDYMOCARPUS LACUNOSA.

This pretty little plant, of which we give an illustration (fig. 38), was shown at a meeting of the Royal Horticultural Society, on July 25, by Messrs. Jas. Veitch & Sons, Chelsea, when it was awarded a Botanical Certificate. It was described in the *Botanical Magazine*, May 1, 1892, t. 7236; and also in the *Gardeners' Chronicle* for July 29, 1893, p. 120.

NURSERY NOTES.

T. H. CRASP AND CO., CLYNE VALLEY, SWANSEA.

It would be difficult to find a more suitable spot on which to form a nursery than this, both in regard to position and also the quality of the soil. Even during the long-continued drought there has been an unlimited supply of water running through the grounds. Within three minutes' walk are the tram-cars running from Swansea to the Mumbles, so the premises are readily reached from Swansea. The coal supply is assured by the presence of a colliery adjoining.

Within the last three months Mr. Crasp has erected six fine span-roofed houses, each 60 feet by 20. At the time of my visit No. 1 house was filled with a fine lot of Maidenhair Ferns, including about 2000 plants in 6 and 7-inch pots, all in grand condition. Hanging from the roof were some nice young Orchids, such as Dendrobiums, Odontoglossums, Cypripediums, Cœlogyne, &c. Previously this house was filled with a fine collection of some 1500 plants of Malmaison Carnation, the true rosy-pink variety, of which Mr. Crasp, as is well-known, is an adept cultivator. Up to the present he has layered some 5000 plants, all looking well, and which will be soon ready for potting up.

The whole of the next house is devoted to Tomatos, the variety being Surprise, which for cropping and market purposes is not easily beaten. House No. 3 is also devoted to Tomatos, with Vick's Criterion carrying a heavy crop. On each side of this house are Black Hamburg Vines, and con-

sidering the short time they have been planted, they have made very good growth.

The next house contains a miscellaneous collection, part being devoted to Tomatos. Under the roof-glass are hanging shelves, on which are growing a fine lot of seedling Coleus in 5-inch pots, also a quantity of Ivy-leaved Pelargoniums in variety. On one side of this house I noticed a fine batch of Lockie's Perfection Cucumber, the whole being intended for seed purposes. My attention was drawn to a pure white Statice, supposed to be the only one in the country, which Mr. Crasp intends shortly to exhibit at one of the meetings of the Royal Horticultural Society. Close by were several plants of a rich scarlet-flowered Begonia, which is well adapted for climbing purposes; also in this house are a fine batch of that most useful Fuchsia Triphylla, flowers orange-yellow.

The other two houses are devoted to Tomatos, from the surface of the ground upwards; Vines are also planted in two of the houses, the variety being

A new Pelargonium raised by Mr. Crasp, called Mrs. H. Lewis, with flowers of a deep scarlet colour, truss large, and a very free bloomer, is well adapted for pot-culture and summer bedding. Two Cannas, named respectively Star of '91 and Louise Thibaut, are undoubtable acquisitions to this useful class of plants.

At the entrance to the nursery, I noticed some fine standard Laurels, with clean stems, from 5 to 6 feet high, and with heads some 3 feet in height and as far through; also fine banks of young Conifers. The Royal Fern, *Osmunda regalis*, is growing here in numbers, some of the fronds measuring 6 feet in height. Several hundreds of Arum Lilies, Pyrethrums, Pansies, Irises, and herbaceous plants also find a home here.

There are 10 acres of kitchen garden, 2 acres being devoted to Strawberries alone; the other portions are cropped with useful kinds of vegetables for market purposes. Two rows, each 50 yards long, of Veitch's Autocrat Peas, in splendid condition, are intended for seed purposes.

Considering the short time since Mr. Crasp has established this nursery, it speaks much for the persevering manner in which the work has been carried out. *R. Milner.*

BEECHHILL NURSERIES, MURRAYFIELD, EDINBURGH.

A visit to a nursery is at all times full of interest to the horticulturist and the lover of plants, and being in Edinburgh recently, I was induced, camera in hand, to wend my way to Beechhill, in full anticipation of finding something specially good or new on which to expose a plate or two; nor was I disappointed.

Notices of Beechhill have so frequently occurred in your columns, that the great majority of your readers are quite familiar with the name of that eminent nurseryman, Mr. John Downie, now deceased. Under the management of his son, the business is making good progress; and from what I saw on my visit, I most heartily endorse the good sayings currently reported, and hereby tender my tribute of praise and commendation.

After the recent refreshing rains, the outdoor department at Beechhill looked fresh, bright, and promising, the neatness and taste displayed in the general arrangement assisting to impress the visitor with the fact that Mr. Goodall well understood how to grow his plants, and to display them to advantage.

I passed through the various brakes of Coniferæ, shrubs, fruit and forest trees, and observed beds and borders of herbaceous plants, which now form a feature of the nursery. The cultivation of Pansies gets much attention at Beechhill, and varieties in great numbers, and a rich profusion of bloom was noted; also Antirrhinum, Delphinium, Phlox, Pæony, and in every available corner were found tuberous-rooted Begonias, of which many thousands are grown.

The glass department justly claims the admiration of the visitor, for the light airy arrangement pervading all of the houses. Everything is neat, bright, and clean.

While most nurseries gain a reputation for one or two specialties, here at Beechhill, Downie seems to be making many kinds of plants specialties, and everything is of the best.

On being conducted over the Orchid department by Mr. Munro, I observed some fine specimens of Orchids, the nucleus of a collection now being formed. Some Dendrobium Wardianum were shown which were finishing up pseudobulbs from 3 to 4 feet long. Though here the present flowering season is past, the Orchids, as a whole, are well advanced in growth, and look very healthy.

In the show-house tuberous-rooted Begonias were seen in great variety, occupying the whole length of the front stage, and a very fine and effective show they made.

In the stoves were to be seen Dipladenias, Stephanotis, Ixoras, Pandaanus, Anthuriums, Crotons, Caladiums, &c., and a choice collection of Gloxinias and Thunbergias. I was next shown the Ferns,

FIG. 38.—DIDYMOCARPUS LACUNOSA. FLOWERS VIOLET-BLUE.

Muscat of Alexandria. Mr. Crasp informed me that during the last six weeks he has been cutting from 100 to 150 lb. of Tomatos each day. In the course of a few weeks it is intended to erect a vinery for late Grapes, 100 yards long by 20 feet in width, which will be used early in the new year for the forcing of early Strawberries, of which some 6000 plants are already layered in their fruiting pots, the varieties being Laxton's Noble and President. The whole block of houses are heated by one powerful Thames Bank boiler. There are also in course of erection a number of pits, for the propagation of Conifers.

Some 500 plants of tuberous Begonias are grown, of a fine strain, and in the best condition, some blooms of the pure white, rose-pink, and scarlet varieties measuring from 5 to 6 inches across. Several hundred plants of Chrysanthemums are grown, including most of the leading varieties. A fine dwarf double-flowering Tropæolum is being propagated very extensively; the flowers measure from 1½ to 2 inches in diameter, and are of a rich orange colour—for conservatory or greenhouse decoration it will be most valuable, and for bedding purposes also.

my attention being first directed to a fine lot of *Adiantums*, including *A. scutum*, *A. concinnum*, *A. decorum*, *A. regina*, *A. Victoria*, and *A. Williamsi*; but to me one of the most interesting was a splendid specimen of *Pteris Mayii*. *Pteris* are grown in great variety.

In the houses devoted to greenhouse plants, as in the other houses, every available bit of space is made use of, and here were found tuberous-rooted *Begonias*, *Pelargoniums*, *Statice*, *Carnations*, *Ericas*, *Epacris*, and the usual assortment of New Holland and other hard-wooded plants.

Those who may at any time find themselves in the neighbourhood of Beechhill should certainly pay the place a visit. *G. S. Wyness*.

STOVE ROCKERY-HOUSE AT CHELSEA.

In conjunction with the Orchid department and several of the other departments in the nurseries of Messrs. Jas. Veitch & Son, King's Road, Chelsea, artistically arranged rockery-houses have been provided in which to display the principal plants of the season among Ferns and foliage plants, and these houses are kept gay throughout the year. At the present time in the rockery-house of the stove-plant section a magnificent show is made up of groups of *Caladiums*, batches of the two fine blue *Exacum*—*E. affine* and *E. macranthum*; fine spikes of the white and fragrant *Pancretium*, variously red-tinted *Ixoras*, showy *Anthuriums*, *Rondeletia speciosa*, the pretty new *Strobilanthus Dyerianus*, neat plants of the greenhouse *Rhododendrons* both single and double, *Tillandsia*, &c., and in one corner an interesting batch of insectivorous plants; among the various species of *Sarracenia* being the rare *Heliophora nutans*, pans of *Cephalotes follicularis*, and *Dionæa Muscipula*, *Drosera capensis*, *dichotoma*, *spatulata*, *angularis*, &c.

Nepenthes at Messrs. Jas. Veitch & Sons.—Those who see but an occasional plant of the always-admired Pitcher Plants have no idea of the beauty of the large houseful of them always to be found at the Royal Exotic Nurseries, nor of the diversity of colour, size, and form in the urn-like appendage of their leaves. For beauty, freeness of growth, and brightness of colour, the palm is unanimously awarded to *Nepenthes Mastersiana* × raised by Messrs. Veitch, between the beautiful but obstinate *N. sanguinea* and *N. distillatoria*. Among the others, *N. mixta* has grand red pitchers, with brownish-crimson blotches; *N. Rajah* is entirely dark crimson, *N. Burkei* has noble dark-coloured pitchers totally unlike any of the others, and the large rosy-tinted green *N. bicalcarata*, with the two sharp teeth at the base of the lid, is equally distinct. Other specially handsome kinds are *N. Chelsoni*, *N. Hookeri*, *N. Veitchii*, *N. sanguinea*, *N. Curtiei superba*, *N. Rafflesiana*, and *N. Northiana*, and the general view of the hundreds of pitchers hanging from the plants overhead is very beautiful.

THE WEEK'S WORK.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

GREENHOUSE PLANTS.—Give abundance of air to any plants of *Azalea indica* that have completed their growth, and continue to syringe well each night and morning to keep down thrips and red-spider. Give good waterings of weak liquid-manure occasionally. When the plants are placed out-of-doors they are often injured by storms and wind. Careful attention must be given to the watering of specimen *Erica* plants, and see that the drainage is in perfect order; thorough waterings of rain-water should be given when required, and let the ventilators of the house remain open night and day. Attend to the cleaning and training as soon as the plants have done flowering. A house with a north aspect is very suitable at this season for the summer-flowering varieties. *E. hyemalis* and *E. Willmoreana* should now be growing well in pits or frames. The lights should be taken off during fine weather, but care must be taken to protect them against storms. *Epacris*, *Eriostemons*, *Dracophyllums*, *Dillwynias*, *Lechenaultias*, *Pimeleas*, *Tremandras*, *Genetyllis*, *Aphelexis*, *Phonocomas*, all natives of New Holland and the Cape are not so often seen nowadays as they deserve to be. They require much attention during the growing period.

Put them in a good well-ventilated house, and place in a position where they are not shaded with climbers or other plants, and within a short distance from the glass. *Tremandra verticillata* is a beautiful free-growing exhibition or decorative plant, and lasts in flower a long time; it wants well pruning in, or it gets too tall. *Pimeleas* should now have a good airy position, to ripen the wood, and be well trained out as soon as they require it. *Kalosanthes coccinea* and *K. jasminea* are beautiful sweet-scented flowers of brilliant colours, and are most useful decorative and exhibition plants. The present is a suitable time to take cuttings of shoots that have not flowered; place them singly in small pots in loam, leaf-mould, and sand. They will soon strike in a little heat, when they may be kept in a cool-house during the winter with very little water; they are best kept rather dry during the dark days. Old specimen plants that require potting should have a good portion of broken-brick rubbish mixed with the soil, and the pots must be clean and well drained. Give plenty of air and light to plants that are growing on for flowering next spring. The shoots are heavy, and they require strong light canes to support them; they flower well in 6 or 8-inch pots, and when they have completed their growth in the autumn they may be stood in a cool greenhouse or pit, and should be kept rather dry until the spring.

ROCHEA FALCATA, is a useful scarlet-flowering greenhouse evergreen plant, very useful for vases or rockwork; it flowers during the summer, and it likes rough soil, and to be kept dry in the winter.

CACTUS.—Most of this tribe of plants will have completed their growths, but judicious waterings must still be given, and it should not be withheld until cold weather has commenced. Manure in some form should be given, to keep the foliage a good colour. Scale and red-spider must be kept from them by good syringings of clean water. See that the drainage is efficient; plants growing in small pots are best placed on a shelf or board during the autumn and winter months; they like abundance of air and a temperature of from 50° to 60° in winter.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

ODONTOGLOSSUM VEXILLARIUM.—Any requiring potting or top-dressing should be seen to during the present month. I do not believe in potting *Odontoglossums* every year, but only as often as they require it. Under some circumstances it may happen that a plant may require repotting within a month, but this would be owing to the soil having become sour. When this is the case, it is well to wash the roots of the plant, and start afresh with it. The important point in growing these *Odontoglossums* well is cleanliness, for if the plants become at all infested with thrips or any other insect, they very soon begin to look sickly, and the only way to keep them clean is by continual watchfulness. The mode of cultivation which we have practised for a number of years with success is as follows:—The compost for potting is prepared well beforehand, the sphagnum moss having been picked over, and all the leaves and weeds, &c., taken out; it is then placed in a tub of water, and allowed to remain twenty-four hours. In newly-gathered moss there are always a large number of snails and snails' eggs, and by this soaking in the water, and by the sousing it gets in washing, a large percentage of these are destroyed. Another point in favour of this practice is, that the moss freshens up, and grows much better. It is rinsed through clean water, and we then chop the moss up to suit the purpose for which we require it; we then mix equal parts of sphagnum and good fibrous peat, with a fair sprinkling of finely-broken crocks. Sufficient plants for a day's work, according to the hands at the potting-bench, are then fetched, and a tub of warm soft water is got ready; half a pint of Fir-tree oil which has been dissolved in boiling soft-water is added, and we then take the plants and hold them in the solution with one hand and wash every leaf through the thumb and fingers. If there are any thrips in the new growths, they are killed during the washing, and the plants are then rinsed through clean water. Any requiring potting are turned out, and every particle of compost washed from the roots, after which they are laid to dry; those only requiring top-dressing are laid on their sides to dry before the new compost is added. The stages are washed down with soft-soap and water, so that everything about them is made clean, and so treated, our plants require but one dipping in

twelve months. Frequent dippings as some growers recommend kill a great many more plants than the insects, but constant damping and syringing will do some good. We use as little fire-heat as possible, just keeping the pipes warm. Of course, in the winter time a little more will be required. The temperature of this house for the next few months should reach from 60° to 65° at night; but the day temperature, according to weather, during the winter months, should be as near 55° to 60° as possible, with a rise of a few degrees during day. Give all air possible on favourable occasions, and always keep the bottom ventilators open a little at night. Nothing will take any harm if the temperature falls to 50° in early morning. This house will be found to suit *Odontoglossum Phalaenopsis* for the next two months, when it may be removed into the cool end of stove when the temperature runs about 60°. *Odontoglossum cirrosum*, *O. nœvium majus*, *O. blandum*, and *O. maxillare*, all require similar conditions.

THE COOL ODONTOGLOSSUM-HOUSE.—*Odontoglossum crispum*, *O. Andersonianum*, *O. Ruckeri*, *O. gloriosum*, *O. Halli*, *O. hystrix*, *O. nebulosum*, *O. polyanthum*, *O. tripudians*, *O. triumphans*, or any others growing in this house should be taken in hand at once. This is the best time for potting, and if they are not finished by the middle of September, the remainder are best left over until February. By potting during August and September, the plants commence new root-action before the short dull days set in, and if any be left until February the days are beginning to lengthen, and the plants very soon start again into new growth. The same treatment in regard to the operation of potting, recommended for *O. vexillarium*, is again necessary when doing this section. I make a practice of potting as many only as require it each year, and the others where the potting-material is sweet, and the sphagnum fresh, receive a little new peat, and the moss again put on, which soon grows and becomes green. When potting the *Odontoglossums*, never use pots of too large a size, but rather err on the other side. Use clean pots and clean crocks. Half fill the pots with the latter, and after potting do not overwater them, but give sufficient only to keep the sphagnum green until root action has well commenced. The syringe may be used daily amongst the pots and overhead. For the first few weeks after potting keep the plants fairly shaded, and rather closer than usual. After the tropical weather we have had, our plants of *Odontoglossum crispum* look better than they have ever done. Some of the plants grown in a lean-to house, under a north wall, do not look nearly so well as those grown in small span-roofed houses. It is a mistake to build *Odontoglossum*-houses under a north wall.

THE FLOWER GARDEN.

By T. H. CRASP.

VIOLETS.—The late drought has been very prejudicial to the growth of these, and unless red-spider is checked, and the growth encouraged as much as possible, the crowns will be very weak for flowering this season. The surface of the soil should be stirred, and good manurial waterings given, and this supplemented with a mulching of well-decayed manure.

VERBENAS.—These once-fashionable bedding plants seem to be regaining favour, and where such is the case no time should now be lost in taking off the cuttings for next year's display, and they will root much easier now than late in the autumn. If struck early, far better established plants are obtained to stand the winter, and they are not so subject to attacks of mildew. The usual preparation of the cuttings should be made, selecting the non-flowering growths which issue from the base of the stem. It is advisable to propagate from cuttings annually; a more even growth is obtained, and a greater profusion of bloom than from plants raised from seed. Since the showery weather, all spring-bedding plants that were divided and transplanted a few weeks ago, will be growing freely. The surface of the soil should be frequently moved between the plants; it will kill all seedling weeds, and further assist the growth of the plant. An occasional watering of liquid manure would also prove very beneficial. *Silene pendula* and its varieties should be sown in an open border, but in the case of other spring-flowering annuals, about the middle of the month will be quite soon enough. This applies to such things as *Alyssum maritimum*, *Collinsias*, *Saponaria calabrica*, *Limnanthes Douglasi*, *Virginian Stock*, *Lasthenia californica*, *Nemophila insignis*, &c. *Onosma tauricum*, and a beautiful and comparatively new variety, *albo-roseum*, are choice gems

among alpine plants, and are the two most beautiful of the Borageworts; they flower in May and June, and delight in a moist, loamy soil, with perfect drainage. The present is a good time for its propagation, although it may be safely propagated at any other season of the year when cuttings are obtainable. At this period, however, cuttings of the right stamp are more plentiful than they are at any other. They should be taken off with a heel when 3 or 4 inches in length, and inserted in pots containing very sandy soil, afterwards placing them in a cool, shady frame or hand-light, which may be kept close for a time. The cuttings will be rooted in about three or four weeks, when the lights should be raised, and ultimately removed altogether. Its beautiful drooping golden flowers, in long cymes, render it a favourite whenever seen in good condition. The chief work with bedding plants now is picking off decaying flowers and cutting in growths within bounds. The continued use of the shears, scythe, and hoe is also necessary to good keeping. A highly-kept flower garden should have no signs of work about it, but it is few places that can be kept so. It is always the best policy, however, to keep a portion of the ground thoroughly, than a large area only half-done. If plants have been placed in beds thickly to fill up at once, they should be thinned out; and where there are choice varieties of bedding plants, a few cuttings may now be put in to ensure a good stock for next year.

THE HARDY FRUIT GARDEN.

By T. TURTON, *Gardener, Maiden Erlegh, Reading.*

PEARS.—Finish gathering *Bon Chrétien*, *Burré de l'Assomption*, *Souvenir du Congrès*, and *Clapp's Favourite*, all of which, if left on the trees too long, and especially if growing on walls, eat mealy and without their proper flavour. Make small gatherings of *Burré d'Amanlis*, *Jersey Gratioli*, *Brockworth Park*, *Fondante d'Automne*, and any other sorts of same season, gathering in each case the finest fruits, and the crop, having been thus lightened, the remaining fruit will continue to grow, which, if gathered at intervals of about a week, will keep up the supply for a considerable season. As the time is now approaching when birds, the tits in particular, begin to peck the fruit, all trees growing on walls should have netting put over them as early as possible, and also bush and pyramid trees where it is practicable. In some gardens, unless protected, the greater portion of the crop will be rendered worthless by being thus pecked, and as prevention is better than cure, it is policy to protect, ere the birds commence their work of destruction. Previous to netting the wall trees, give them a few good washings with the syringe or garden engine to militate against red-spider. Most wall trees which have come under my notice this season are more or less infested with this pest.

APPLES.—The forcing character of the weather, at least in the southern part of the country, is causing many of the earlier sorts to exhibit signs of ripening. These include such sorts as *Lord Suffield*, *Frogmore Prolific*, *Ecklinville Seedling*, *Stirling Castle*, *Keswick*, *Manks'*, and *Dutch Codlins*, &c. These should be gone over somewhat frequently, and any fruits which do not part from the tree when raised to a horizontal position, should be left, for, as in the case of Pears, when the crop is lightened, what are left may continue to grow; and the longer the fruit will remain on the trees the greater will be its keeping qualities.

PEACHES AND NECTARINES.—Very careful watching must be exercised that the trees do not want for water, which should be given very liberally until the fruit shows signs of ripening. The dropping of fruits before they are quite ripe often arises from this want. With shorter days and heavier dews at night, unless the trees are badly infested with red-spider, syringing should no longer be necessary, and if it is continued too long there is risk of the water lodging about the fruits, which will cause them to rot.

PACKING PEACHES.—I can never understand why so many should have the impression that Peaches are difficult to pack to ensure their travelling safely. The points to be observed in packing Peaches, are, that they be gathered before they become quite ripe, have proper material to pack them with, and boxes of a suitable size. Lawn mowings, where the same are free from leaves and other rubbish, and have been properly dried by being frequently turned in the sun, before being stored away in hampers, form the best material, and one available by every gardener. The mowings used here

are got from the cricket-grounds, which being in the open park, and also free from weeds, &c., the mowings are much cleaner than it is possible to obtain from the lawn, where trees and shrubs abound. As regards boxes, the following should be the inside measurement. For twelve fruits, medium size, length 14 inches; width, 10 inches; depth, 3½ inches; allowing 3 inches in length or width for every row of fruit over that number. Wrap each fruit in tissue-paper, packing between the fruit with the dried grass as the work proceeds, and filling up the box with the same substance.

THE APIARY.

By EXPERT.

ROBBING.—This evil should be guarded against in every possible way, for if it is once commenced it is very difficult to eradicate. Bees are now very easily excited, and hives should not be opened unless it is positively necessary, and then only in the evening. No comb, honey, or sweets of any kind should be left about, either in or out-of-doors, as it is astonishing how quickly the bees will find it, and become a terrible nuisance in their pertinacity to acquire it. Should robbing by any inadvertence have commenced, the best thing to check it is a free use of the carbolic solution (1½ oz. Calvert's No. 5 to 1 quart warm water). If this is sprinkled with a feather on the alighting boards, it soon has a salutary effect; but in bad cases it may be found necessary to hang cloths saturated with it over the front of the hives. Entrances should now in all cases be contracted to 1 inch or less.

STIMULATING.—With the object of keeping bees on breeding, and obtaining plenty of late-hatched workers to commence next season's labours, slow feeding may now be resorted to, and nothing is better for the purpose than dry sugar. This should be given in a hollow dummy-feeder hung at the side of the frame. These feeders can be easily made with bar frames by providing a piece of one-quarter board for each side. One side is nailed on to the frame, the other being removable for the convenience of putting in the sugar, and kept in place with little right-angled wire staples at top and bottom. A quarter-inch opening must be left at the top of the movable side for the bees to get in and out. *Porto Rica* is the best sugar to use, as it is free from beet, and is also moist, and fine in grain. This feeding is also to be recommended by the fact of its keeping the bees employed at a season when they would otherwise have nothing to do but to embark on pilfering expeditions.

FRUITS UNDER GLASS.

By M. TEMPLE, *Gardener, Carron House, Falkirk, N.B.*

PEACHES.—Peach trees which fruited early in the season are ripening their wood very early, and the leaves should be kept hanging as long as possible. An examination of the soil must be made, and where there are signs of dryness in the border a thorough soaking of water should be given. Keep the foliage well syringed, to prevent red-spider. If black-aphis is troublesome, syringe with an insecticide several evenings in succession, and fumigate also if necessary. If the wood is not ripening well in early houses, this indicates defective root action, and the absence of fibrous roots will keep up the circulation of sap when the trees should be at rest, resulting afterwards in bad setting of fruit in January or February. In such cases all succulent growth should be removed from the bearing wood. Gross shoots, which are to take the place of the current season's bearing wood, should be stopped and kept pinched as soon as a few leaves are formed; and before the end of the present month a portion of the roots at one side of the tree, and any that are descending far below the surface, should be lifted and shortened, placing a firm layer of brick and lime-rubbish under the tree to prevent further trouble from tap-roots. The side-shoots should be laid-out evenly on a firmly-beaten loam, mixed with a fourth-part of lime-rubbish, to which may be added about a quart of soot in each barrow-load of soil. This covered with good loam, and afterwards watered, will induce fresh fibres to grow, and the tree thus treated will be in good bearing order when the coming season arrives. A *Stanwick Nectarine* we treated thus some weeks ago is doing as well as could be desired. Keep foliage clear of ripening fruit, and air freely night and day. Latest crops may require abundance of water, and some good liquid manure if the crops are heavy, and the trees are showing signs of distress.

FIGS.—Some gardeners enquire why their Figs drop the first crop of fruits? Where such is the case

we would direct attention to the roots, as in most cases the mishap occurs where the border is shallow, or the active roots are not getting the proper amount of water when they require it most. Too copious supplies of liquid-manure, cold undrained borders, position of the roots in dry subsoil, are sure to cause fruit dropping. Figs will stand a deal of dryness when they are resting, but the reverse is the case when the fruits are swelling; trees which supplied fruit in April and onwards, may be allowed to rest as soon as the second crop of fruits is gathered; those which are to ripen fruit as late as November, must be liberally dealt with if the roots are in healthy condition.

ORCHARD HOUSES.—The orchard-houses will be losing much of their furnished appearance by the removal of early-fruited trees (in pots) to resting quarters; but the same attention to watering, airing, and to the destruction of insect life must be in force as heretofore. When Plums, Peaches, and other stone fruits show signs of ripening, they must be kept dry overhead, and growing shoots should be pinched back, in order to facilitate a free circulation of air, and allow the full action of the sun upon the fruits. If wasps are destructive, it may be well to remove ripening fruits, and lay them in a dry airy room to finish. Pears may be gathered in small quantities, and placed in heat to ripen early, or in a cool shady room to prolong the season. Let no liquid manure be supplied when the fruits are fully swelled.

THE KITCHEN GARDEN.

By H. C. PRINSEP, *Gardener, Buxted Park, Uckfield.*

CABBAGES.—Owing to the hot and dry weather of the last week, plants have made but little progress, and seeds recently sown have not yet germinated. They must be well supplied with water, or the plants will not be strong enough at planting time. Watering is becoming a serious question in some places, for springs are very low, and every drop of water consequently must be brought some distance before being used. It will, however, pay the cultivator to look well after these small seedlings, for the time will soon be round when they must be ready for their permanent quarters. Colewort may still be planted, but showery weather should be chosen for the work, if possible.

AUTUMN ONIONS.—These, like Cabbage, demand special attention, that the little seedlings do not get dried up for want of moisture. If growth be checked when the plants are young, it is rare that fine bulbs are obtained from them. Some of the early kinds commence to bulb while small, and if growth is not encouraged, they form picklers in dry seasons instead of strong plants for transplanting.

LETTUCES.—Seed of the brown Cos that was sown according to previous instructions will be large enough for transplanting. Seize the first opportunity, should there be showery or dull weather, to get the plants into their permanent positions. We find an exposed place in the open the most suitable, for there they grow sturdily if afforded sufficient room. Plant in rows 15 inches apart, and 1 foot between the plants. Make another sowing of hardy kinds to succeed those now ready for transplanting.

CAULIFLOWERS.—The last sowing should now be made in most districts, unless it be in the extreme south. Cover the ground, to prevent evaporation when the seed is sown, for nothing tends to weaken the plants so much as a lack of moisture at the period of germination. Dust the ground over with lime, for the larvæ of the Cabbage-weevil are troublesome in dry weather, and soon spoil a batch of healthy plants.

CELERY.—It cannot be too deeply impressed on the cultivator how necessary it is to pay particular attention to Celery at the present season. Growth should be made as quickly as possible if the Celery is to be crisp and sweet. Abundance of moisture must be given to the roots, for little progress will be made where watering is neglected. That intended for early use should now be earthed up, but blanching should be deferred as long as possible, as growth is checked by the process.

PEAS.—The hot dry weather in the South is causing much trouble to the grower, the ground having become so parched. Water must be given regularly at the roots. If mildew makes its appearance, dust the foliage with sulphur early in the morning while damp. In districts where there is more moisture in the soil, a freer growth is made, and it will not be necessary to give the plants such strict attention.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

SHOWS.

SATURDAY,	AUG. 19	{ Great Co-operative and Industrial Exhibition at the Crystal Palace.
WEDNESDAY,	AUG. 23	{ Shrewsbury Horticultural Fête. Show of Gladioli, &c., at the Gardening and Forestry Exhibition, Earl's Court.
THURSDAY,	AUG. 24	{ Basingstoke Horticultural. Weymouth Horticultural (two days).

SALES.

MONDAY,	AUG. 21	{ First Special Trade Sale of Dutch Bulbs; also 56,630 Liliun Harrisii, in grand condition, at Protheroe & Morris' Rooms.
THURSDAY,	AUG. 24	{ Special Trade Sale of Dutch Bulbs at Protheroe & Morris' Rooms.
FRIDAY,	AUG. 25	{ Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—61°·3.

The temperature at Ealing, Middlesex, on August 16, was 92° (F.) in the shade.

Mushroom Culture.

EVERY gardener is familiar with the process of growing Mushrooms from spawn, but general as the practice is, no sanitarian—especially in these days of bacteria—could for a moment sanction it as free from risk. Fortunately, the Mushrooms are cooked before being eaten, or doubtless we should hear of more serious consequences resulting from their employment. In botanical laboratories it is an object to isolate and cultivate particular fungi from the spores. By this means the whole life-history of the fungus can be watched, and any one fungus kept free from its neighbours. Messrs. COSTANTIN and MATRUCHOT have lately laid before the French Academy of Sciences of Paris a note relating to their method of growing Mushrooms from the spore. Fancy a paper on Mushroom-growing presented to our Royal Society!

The French experimentalists do not give the details of their procedure, but they tell us the principles on which it is founded. Pure spores are obtained, how is not stated, and these are sown in a manner which secures the absence of any spores of other fungi. The spores are cultivated on some nutrient medium previously sterilised to insure the absence of any foreign spore. In this way a pure spawn is produced which can be indefinitely increased, and which can be grown-on on sterilised dung or in ordinary Mushroom-beds.

Mushroom spawn, as we know, is subject to various diseases and deformities, which may be avoided by the culture of pure healthy spawn. Again, some varieties are preferred to others, but in the present nasty system of cultivation there is no certainty what form may arise, and no means of eliminating it. By the new system any particular form can be cultivated free from admixture with others. The production of spawn can ordinarily only be depended

on at the end of autumn and in winter, but by the new process spawn can be had at any time.

It is very satisfactory to find the processes of the laboratory thus turned to practical account. As we have said, Messrs. COSTANTIN and MATRUCHOT do not precisely indicate the details of their procedures, but anyone familiar with the means which botanists and students of bacteria employ, will have no difficulty in understanding the principle on which it is based, or in devising similar methods for themselves.

It remains to be seen whether the new process can be carried out with success commercially. If it can—and the probabilities, we should say, are, that the cost of production would eventually be less than by the old method—then we may hope, but certainly not expect, that the new process, with its cleanliness, certainty, and security from disease-germs, will oust the nasty methods at present in use. It seems likely that some of the gardeners of the future will receive a laboratory training, and when this is the case, we may hope for a further development of fungus-culture to practical ends. In the meantime, it is something to have got even to the experimental stage.

CRIMSON RAMBLER ROSE.—We are pleased to be able to lay before our readers an illustration, from a photograph, of this very attractive Rose (fig. 39). It was shown at the great Horticultural Exhibition at Paris this year, as well as at the Temple Show, and other meetings of the Royal Horticultural Society, at all of which its merits were suitably recognised. Many have had the opportunity of seeing it, and they will not question our opinion that it is the most beautiful hardy Rose of its kind introduced for many years. It is of Japanese extraction, and is a form of *R. polyantha* or *multiflora*. As a pillar Rose, as shown in our illustration, its glowing clusters of crimson flowers are seen to great advantage; but pegged down for bedding purposes it is equally attractive. We have before us photographs of a border of these Roses, with the trees growing as pillar Roses at the back, and in the foreground a broad belt of the same Rosea pegged down. The effect must have been magnificent. We congratulate Mr. CHARLES TURNER, of Slough, on the introduction of this charming novelty, which adds another to the many triumphs scored by the firm.

THE ROYAL SCOTTISH ARBORICULTURAL SOCIETY.—The members of the above Society, during the past week, visited Windsor, the New Forest, Burnham Beeches, and Kew, and were present at the Earl's Court Exhibition on Saturday, when they were entertained at luncheon. Mr. H. E. MILNER, the Chairman of the Exhibition, presided, and proposed "Prosperity to the Royal Scottish Arboricultural Society." In reply, Mr. DUNN, a member of the Council of the Society, said that the members in their visit to England had been able to store their minds with knowledge which they could not have acquired at home. He urged that those in authority should give more encouragement to forestry. In concluding, he proposed the toast of "The Gardening and Forestry Exhibition," to which Mr. MILNER responded. The toast of "The Chairman," proposed by Mr. CHARLES BUCHANAN, of Penicuik, closed the proceedings. The members then examined the forestry exhibits under the guidance of Professor CURTIS. A detailed account of the proceedings of the Society will be found in another column, and will be continued in our next.

ROYAL BOTANICAL SOCIETY OF LONDON.—The fifty-fourth anniversary meeting was held at the Gardens, Regent's Park. The Duke of TECK was re-elected President, and Mr. H. LINDSAY ANTHOBS Treasurer for the ensuing year. From the annual report it appeared that the number of new Fellows elected was nearly the same as last year. The various exhibitions and fêtes had been success-

fully carried out, the exhibits, both in number and quality, being above the average; that of the evening fête especially had been the largest since it was instituted twenty-two years ago. The scientific work of the Society had rather increased than otherwise; nearly 700 students of science, art, and medicine had received free orders of admission of from one to three months during the year; and the facilities offered to schools, classes, and scientific societies generally had been largely taken advantage of. Among new clients in this branch were many of the students studying botany in the London Board Schools. The special plants successfully cultivated for the first time included specimens of the Mangrove (*Rhizophora*), and an ant-habitation plant, from Torrea Straits. Within the tuberosa root of this plant numbers of the common red garden ant had made a home, to the apparent benefit of both. The meeting closed with a unanimous vote of thanks to the chairman. *Morning Advertiser*.

THE LATE MR. THOS. LAXTON.—We have received several letters showing the general esteem in which the late Mr. THOS. LAXTON was held by horticulturalists with whom he had dealings. In our notice last week we inadvertently included the variety *Jno. Ruskin* amongst the Strawberries Mr. LAXTON had raised, but this was sent out by Messrs. LITTLE & BALLANTYNE, of Carlisle.

EALING GARDENERS' ASSOCIATION.—The members of this Association journeyed on Tuesday last to Park Place, Henley, the delightfully-situated residence of Mrs. NOBLE. The visit was much appreciated, as the gardens and grounds attached to this fine place were in first-class condition.

AUGUST HORTICULTURAL MEETING AT GHENT.

—Certificates of Merit were awarded to M. L. DESMET DUVIVIER, for *Carludovica palmæfolia*, a very ornamental plant; for *Poinsettia pulcherrima variegata*, a pretty novelty with ornamental foliage, green, bordered broadly and irregularly with yellow; both from the above-named exhibitor. To Anguloa eburnea, an excellent and rare variety; *Lælia elegans Turneri*; *Cattleya Eldorado* var. *Wallisi* and *Phajus Humbloti* (the two latter magnificent Orchids), all from M. Van Imschoot. To Mme. Henri de Wadrin de Rouselle for *Vanda cœulea* var., a large and fine flower of brilliant azure blue. To M. Sczewicz for *Begonia fulgens*, a species much to be recommended for the open ground. It lasts well till late in the year; the flowers exhale an agreeable perfume in the mornings. To M. F. Desbois for *Adiantum cuneatum*, a charming novelty, sure to find favour in the future. To the same exhibitor for *Philesia buxifolia*, an old plant which should be widely cultivated. To M. J. Hye for *Cypripedium Youngi*, a capital novelty already described in the *Gardeners' Chronicle*. To the same exhibitor (*à l'unanimité*) for *Odontoglossum Schroderæ*, a novelty of much value. To M. J. Moens of Lede for *Cypripedium Haynaldianum* Mille. Clotilde, a remarkable hybrid raised by the exhibitor from *C. Leanum superbum* × *C. Haynaldianum*; the flowers are very large, wide open, resembling both parents equally; dorsal sepal clear green, dotted transversely with ashy-brown at the base, clear rosy-yellow, also spotted and shaded with lilac-rose below the centre, the upper two-thirds being pure white, the midrib violet-rose. Inferior sepal pure white in the centre and base, and bordered with cream colour. Petals very open, curved, olive-yellow in the basal half, and dotted all over with brown, the upper half clear violet-red. Staminate horse-shoe shaped, dull white, marked in the bend with two violet-magenta coloured teeth, and with pretty amethyst-green (!) hieroglyphics in the centre. Lip large, nearly square, in colour clear green, shaded with chestnut-brown. Scape dark shining brown. Bract green, dotted all over with black; flowers three to five. Certificatea for cultivation and blooming were awarded to MM. EDM. VERVAET ET CIE, for *Dendrobium thysiflorum*, with five excellent clusters; to the same firm for *Succolabium guttatum*, with a very long raceme, an exceedingly pretty variety; and to

M. JULES HYE for *Odontoglossum Harryanum*, with excellent flowers, dark in colour; and for a well-flowered specimen of *O. tentaculatum*. *Ch. de B.*

TORQUAY DISTRICT GARDENERS' ASSOCIATION.—The first annual outing of the above Society

THE CONTINENTAL SEED CROPS.—As far as the seed-growing districts of Holland are concerned, the Cauliflower crop promises to be a very good one. Cabbage, Savoy, Brussels Sprouts, and Borecoles not so promising; though they looked remarkably well at the close of the winter. They subsequently

a good crop. Onion very good. Carrot only a small one.

TUNBRIDGE WELLS GARDENERS' ASSOCIATION.—A very successful meeting was held at the Society's Institute on Tuesday, the 8th inst., the exhibits being both numerous and interesting. It was announced that at the next meeting, to be held on the 22nd inst., a paper would be read by Dr POLLEN, of Tonbridge, on the "Flora of India." On the following day a large party of members, together with friends from the Tonbridge Society, made an excursion to Swanley, and inspected the establishment of Messrs. H. CANNELL & SONS, and Messrs. LADDS & SONS, after which the company paid a visit to Lullington Park, the seat of Sir WILLIAM HAAT DYKE, Bart.

THE BRITISH PTERIDOLOGICAL SOCIETY.—On Monday, August 7, the usual annual meeting was held at the Phoenix Rooms, Lancaster, and was very well attended by the leading Fern connoisseurs and Fern-finders of the Lake and other congenial districts, mainly, however, of the vicinity; since, singularly enough, though the south-western counties of England must be accounted not only richer in species than the northern, but also even more fertile in those curious and beautiful varieties which excite so much attention, there are few enthusiasts; while taking Kendal as a centre, ardent Fern-hunters and growers, and splendid collections are liberally dotted about the country—while, too, throughout the south a choice British Fern in a cottage window is a rarity. In the northern districts in question it is impossible to go far without seeing beautiful and rare specimens. It is due to this fact that the only Society existing in this special direction has originated in the north, and though many of the prominent Fern-lovers of other and distant localities figure among its members, its meetings are perforce held in the midst of the majority. Dr. F. W. STANSFIELD having, during the ordinary business, been re-elected President, received a very cordial reception, it being felt by all present that a man representing the third generation of a renowned Fern-loving family, was peculiarly fitted for the post. The formal business over, which included the re-election *en masse* of all the officials, Dr. STANSFIELD gave a very interesting address. In the first place he laid special stress upon the value of such natural hobbies as sovereign specifics for mental worry. The President then proceeded to review some of the discoveries for which science was indebted to amateurs in connection with our British Ferns, pointing out that phenomena of peculiar biological interest had been remarked and recorded in the direction of their reproduction which had awakened world-wide interest, and which, if abnormal forms had continued to be treated as simple monstrosities unworthy of attention, would never have been observed; and exhorted those present not merely to observe carefully anything which struck them as new and strange, but also to record it, and get their record confirmed and chronicled in proper channels. A paper was then read by Mr. EADON, of Sheffield, on hybridisation, which he contended was not proved, but the subsequent discussion showed him to be in the minority in such belief, since one almost universally accepted case was quoted, together with several instances of cross-fertilisation between varieties which showed in the resulting offspring the joint-parental characters far too clearly to permit of any reasonable doubt. Mr. STEWARDSON of Lancaster followed with a most amusing account of Fern-hunting adventures, and how he caught the Fern fever. One of the chief objects of the society, besides that of bringing widely-scattered Fern-lovers together from time to time, is that of obviating the confusion in nomenclature, which often results from unauthorised names being given to varieties of Ferns, widely different types often appearing with identical names, or *vice versa*. As a result of members being invited to bring plants or fronds to this centre (decidedly the fittest to deal with such a matter), a number of very fine forms were exhibited, discussed, and named. Amongst these was a recently-dis-

FIG. 39.—MR. C. TURNER'S NEW POLYANTHA ROSE, CRIMSON RAMBLER; HEIGHT 6 FEET. (SEE P. 214)

took the form of an excursion to Taunton, on the occasion of the show held there on Thursday the 10th inst. About eighty members journeyed from Torquay by special train. Besides visiting the show, several also inspected the Castle, and some journeyed as far as Claremont, where Mr. W. H. FOWLER'S *Chrysanthemums* interested and delighted the visitors.

suffered very much from the continual drought, and many of the plants perished. The remainder stood well and matured their seeds. Swede Turnips are a very poor crop. White Turnips and garden varieties only a middling one. Mangels and Beets of all kinds a medium crop, the plants having been affected in some parts more than in others. Spinach, Peas, and Radishes are mostly

covered *Athyrium filix-femina*, for which the name of *Clarissima* (Bolton) was suggested, its likeness to that beautiful and hitherto unique form known as *Clarissima* (Jones) being accentuated by its obviously bearing the same "aposporous" soral excrescences in lieu of spores proper. The name was, however, left in abeyance pending the testing of these curious growths. Mr. C. T. DREVEY following the presidential address, referred especially to this new acquisition as illustrating the wisdom of Dr. STANSFIELD'S remarks, the first-found type of this class being held for twenty years as a perfectly barren plant, though when once the curious growths were understood, an inch or two off one of the pinnae yielded a host of youngsters. Messrs. JNO. WILSON, STEWARDSON, EADON, WHITWELL, and others participated in the animated discussion which followed the papers, and Mr. WHITWELL as the indefatigable secretary received a unanimous vote of thanks, in which the Treasurer, Mr. WIPER, was included, as it transpired that the expenditure, low as the subscription is, was well within the income, a very appreciable balance being carried over. Finally it was resolved that the annual meeting of 1894 should be held on the first Monday in August, at Bowness, near Windermere, when, weather permitting, it will be combined with an excursion to some of the ferny haunts in the vicinity. Fern lovers of all parts are cordially invited to communicate with the Secretary, Mr. WHITWELL, Serpentine Cottage, Kendal, or with the writer, with a view to becoming members. *Chas. T. Druery, Fernholme, Forest Gate.*

HYBRID ANTHURIUM.—Mr. WRIGLEY obligingly sends us a photograph of a hybrid plant raised by him, together with the following letter:—"I forward a photograph of a hybrid that has lately flowered here; it is a cross between *Anthurium Scherzerianum* var. *Wardei* and *Richardia aethiopica*, the former being the seed-parent. There is not the slightest doubt about my plant being a hybrid, for I possess only a single plant of *Anthurium*, and this is the plant that I fertilised with the pollen of the *Richardia*. The double spathes are both white, spotted with scarlet, and the spadix is a brilliant orange. The larger spathe measured about 1½ inch, and the smaller one three-quarters of an inch. As far as I can make out, I have five hybrids with white and scarlet flowers, all of which produce green young leaves and roots, while the bulk of the other seedlings have produced scarlet spathes, and their young leaves and roots have a red colour when they appear at first. *O. O. Wrigley, Bridge Hall, Bury.*" [The photograph shows that the foliage is that of *Anthurium*; the inflorescence has two spathes. To be quite freed from doubt we ought to have the assurance that the *Anthurium* was not fertilised with its own pollen prior to the imposition of that of the *Richardia*. Ed.]

GRAND YORKSHIRE GALA.—A general meeting of the guarantors and life members was held last Friday evening, Alderman Sir JOSEPH TERRY in the chair. The recommendation of the Council that the sum of £251 be handed over to the York charities was approved. The sum of £175 was added to the reserve fund, bringing it up to £2000, and the remaining balance carried forward to next year's account. Mr. Alderman MILWARD congratulated the committee on the sum which had been devoted this year to charitable purposes, pointing out that the reserve fund of £2000 being now completed, the profits of future years would be handed over direct to charity. The chairman moved a vote of thanks to the Lord Mayor for accepting the office of President of the Council, and for his donation of special prizes, the resolution being cordially carried. Votes of thanks were also given to Sir JOSEPH TERRY, Chairman of the Council, the Vice-Chairman, and the officers of the Society, including Mr. JOS. WILKINSON, Hon. Treasurer, and Mr. C. W. SIMMONS, Secretary. The dates of the gala were fixed for next year as June 13, 14, and 15.

STOCK-TAKING: JULY.—The month just ended will long be remembered for two remarkable events—the French "intervention" in the affairs of Siam, and the war of tariffs between Germany and Russia. As to Siam, owing to the firm attitude assumed by our Foreign Secretary, assisted by our ambassador in Paris, all chance of an entanglement of this country in this latest "Eastern question" has departed, and British commerce in that part of the world is unaffected. Very nearly all the export and import trade of Siam is carried on in British ships; 0.03 per cent. represents the French interest in the cargo value of the foreign trade. As to the tariff war in Europe, for the sake of both empires it is to be hoped that better feeling may soon be established, and common-sense prevail. Meanwhile, our commercial relations with the two peoples cannot suffer—they may improve. But with all this, and other matters presently to be noted, the imports for the month of July show a comparatively trifling falling-off in value—£205,312—spread over some half-a-dozen departments. The figures in the following excerpts from the "Summary" table are those deemed of most interest to the readers of this journal:—

IMPORTS.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£33,497,585	£33,292,273	-205,312
§II.—(A.) Articles of food and drink—duty free	13,182,895	13,499,803	+316,908
(B.)—do., dutiable	2,033,056	2,039,211	+6,155
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	3,894,492	3,385,030	-509,462
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, bawn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,311,399	4,282,287	-29,112
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	851,901	1,115,906	+264,005
(B.)—Parcel Post ...	49,723	38,506	-11,217

In the general figures relating to fruits and vegetables, there are some possessing extra interest for the producer in this country; they are as follows:—

IMPORTS.	1892.	1893.	Difference.
Fruits, raw:—			
Apples bush.	83,911	114,579	+30,668
Cherries "	60,918	52,928	-8,020
Plums "	70,721	337,755	+267,034
Pears "	58,559	221,884	+163,325
Grapes "	7,406	31,051	+23,645
Unenumerated "	205,873	215,797	+9,924
Onions "	301,026	297,253	-3,773
Potatoes cwt.	789,406	253,309	-536,097
Vegetables, unenumerated, raw, ... value	£149,116	£146,549	-£2,567

Of course, the lesson taught in these few lines has been under process of learning for at least half the month, and will be certain to bear fruit.

THE EXPORTS

for the past month foot up the respectable total of £19,651,347, or an increase of £187,777 as compared with the same period last year. This, it must be remembered, has been achieved in the face of bad news from some colonies, from the United States, and from South America—coupled with the growing knowledge that once more the coal trade was to be utterly disorganised. The effect of the last obstacle to prosperity may possibly be more felt in the current month. No manufactures can fail to be affected. Considering that this is the year of grace 1893, we cannot but think the "strike" method of settling differences seems far removed from the pitch of civilization at which we are supposed to have arrived. By the way, we are doing better business with Canada, which has seen its way to profiting con-

siderably by the mistakes of the McKinlay Tariff—vide the last issued financial statement. It may not be out of place to draw attention to the strides being made in Persia by the Russian trader. He is everywhere nearly in that country, working his way south, chiefly by consulting the tastes of the country folks, selling them what they ask for, not trying to force upon them what to the trader may seem best; our manufacturers and shippers may take warning by this and sell the Persian just what he thinks is the best for his money, and accommodating his system of weights and measures to that used in that country.

MISSOURI BOTANICAL GARDEN.—We have before us the fourth annual report of this Institution, founded, it may be remembered, by an Englishman, HENRY SHAW, naturalised in America. SHAW realised a fortune in business, and left a large sum for the maintenance of a garden and Botanic Institute, where all branches of botany and horticulture may be prosecuted. Americans claim him, and are proud of him; but, however this may be, SHAW showed that his English habits had not forsaken him, for among other provisions in his will, he arranged for the annual delivery of a flower-sermon, and the annual consumption of a banquet by botanists and gardeners. In the volume before us is given the report of the fourth sermon, and of the fourth banquet, as well as an interesting account of the course of study followed by the garden pupils. Two scientific papers are appended to these business-publications, one on the "Flora of the Bahamas, Jamaica, and Grand Cayman," by A. S. HITCHCOCK; and one entitled, "Further Studies on *Yucca* and their Pollination," by Dr. TRELEASE, the Director. Three hundred and eighty species are enumerated as natives of the Bahamas, of which only thirteen are peculiar to the island, the greater part being found also in Cuba and Central America. The *Yuccas* are divided into three sets, according as the fruit is fleshy, dry, (and indehiscent, or dry and dehiscent). The flowers are in all cases fertilised by Tineid moths, species of *Pronuba*. All the Eastern species are pollinated by *P. yuccasella*; the Californian *Y. brevifolia* is pollinated by *P. synthetica*, and *Y. whipplei* by *P. maculata*. Professor TRELEASE'S paper is illustrated by photographic representations of *Y. guatemalensis*, *Schottii*, *australis*, *brevifolia*, *elata*, *filamentosa*, *Whipplei* (*Hespero-yucca*), *aloiifolia*, *Treculeana*, and *baccata*.

CATALPA SPECIOSA.—Mr. JOHN BOOTH, of Berlin, calls our attention to the circumstance that this tree has flowered for the last five or six years in the grounds of a friend in the neighbourhood of Berlin, thus anticipating the flowering at Baden-Baden previously chronicled. In the *Revue Horticole* it is stated that this species has flowered recently and for the second time in M. ANDRÉ'S garden in Touraine.

OAKLEY COURT, WINDSOR.—This beautiful estate, situated on the bank of the Thames midway between Windsor and Maidenhead, and for some years the summer residence of the late Lord and Lady ORHO-FITZGERALD, has been purchased by J. L. PHIPPS, Esq., of Brightwell Park, Oxfordshire. We are informed that Mr. PHIPPS will retain the services of Mr. LOCKIE, the well-known gardener and champion Cucumber grower, and who has been head gardener and bailiff here during the last twenty-one years.

MADRESFIELD COURT HORTICULTURAL SHOW.—This old-established show, having been in abeyance for the past two years, owing to the untimely death of its founder, was reinstated on August 10 by the young Earl BEAUCHAMP. The show itself is the model of what a cottager's show should be, and if further evidence was required of the amount of good such institutions do in the improved cultivation of fruit and vegetables, one has only to look over the hedge of the cottage gardens upon this estate to see demonstrated the results of healthy rivalry, and the other benefits obtained by the distribution of high-class seeds, in the shape of additional prizes to the

cottage. The show is confined to tenants and certain parishes, and there were upwards of 900 entries for 200 prizes. The quality of the produce was equal to anything seen at shows of greater pretensions, and would have done credit to any professional gardeners. 114 dishes of Plums, 182 of Potatoes, and nearly as many of excellent samples of Apples were staged, with other things in proportion, whereby the judges' duties were no sinecure ones. The judges were Messrs. THOMAS, WINDSOR, and COLEMAN, EASTON. Another interesting class was that for the greatest number of wasps' nests, exhibited as entire as possible, a 1st prize of 10s. being offered, and an additional 3s. for each nest beyond twenty nests; one competitor in this class staged 193, part of which were hornets', at double price, which brought the prize to nearly £3—a matter worthy of imitation by all show managers. The flower garden, pleasure-grounds, and rocks were thrown open, and looked at their best, being visited by nearly 4000 visitors.

THE SEED EXHIBITS IN THE AGRICULTURAL BUILDING.—Unquestionably the best seedsman's display, says Professor BAILEY in *Garden and Forest*, referring to the Columbian Exposition at Chicago, from an educational standpoint, is that of VILMORIN-ANDRIEUX & Co., of Paris, in the French section of the Agricultural Building. It is different in character from all other seed exhibits in the fact that it makes no great display of mere bulk, but looks more like a section in a well-ordered botanical museum. The space devoted to this exhibit is something like 25 by 70 feet, enclosed by a wall or partition about 10 feet high, lined with deep red cloth. These walls are hung with panels of Wheat, illustrations of the farms and buildings of the firm, specimen charts showing the sugar yield of Beets, and the starch yield of Potatoes, and other features calculated to fasten the attention of intelligent visitors. One side or counter of the apartment is occupied by fourteen glass cases, which contain models or casts of many representative types of vegetables and Strawberries. Disposed at intervals upon the floor are swing-frames and albums of lithographs of various plants, and the centre is occupied by a modest table of vegetable and flower seeds. Everything is labelled with scrupulous neatness and accuracy, and one feels that the exhibit will bear careful study. The name of VILMORIN has long been connected with experiments in the crossing of Wheats, and some of the graphic results are here shown in small sheaves mounted upon tastefully framed green felt. The casts, of which there are several hundred, represent the average or normal forms of vegetables rather than unusual or gigantic specimens, and they are the best models of garden vegetables to be seen in the Exposition. They are made of a hard composition, and will bear handling. It is evident, in the character of the models and their arrangements in the cases, that their first value is a scientific one, in showing the variation of plants and fixing upon a conventional standard or type for the chief lines of development, rather than a mere display of what the firm may have to sell. A couple of the specimen charts are unique. One comprises six glass tubes about 1 inch in diameter and 5 feet long, containing proportionate amounts of "angar in the juice," and refined sugar in the six leading Sugar-Beets. The greatest yield of refined sugar is something over 60 cwt. per acre in the French, while the lowest is only 54 cwt. in the Gray-top. A similar method of exhibition shows the starch-yield from ten varieties of Potatoes, the figures running, per acre, as follows: Giant Blue, 76.7 cwt.; Emperor, 63.2; Giant Nonpareil, 48.6; Reading Giant, 42.6; Juno, 41.9; Aspasia, 37.5; American Wonder, 36.9; Red-skinned Flour-ball, 30.4; White Elephant, 28.2; Reading Russet, 26.7. Altogether, the exhibit is just such an one as a teacher of economic botany or horticulture might be supposed to collect for museum purposes. This style of exhibit is what one expects if he knows the history of the firm which has made it. VILMORIN-ANDRIEUX & Co. is probably the best example of a firm which combines in successful proportions the scientific and commercial impulses. It has been identified with

botany from its inception. The exact foundation of the firm is unknown, but it is certain that in 1745 PIERRE ANDRIEUX was botanist and seedsman to LOUIS XV., and was in business on the Quai de la Mézièrie, in Paris, the same thoroughfare upon which the present firm is located. PHILIPPE VICTOIRE LEVÊQUE DE VILMORIN, the youngest son of a nobleman who was reduced in circumstances through the wars, came to Paris to seek his fortune, intending to practice medicine. He fell in with the botanist DUCHESNE, however, and became acquainted with ANDRIEUX, and he gave up medicine for botany. In 1774 he married the daughter of ANDRIEUX, and upon the death of the latter, in 1781, the firm became known as VILMORIN-ANDRIEUX. It acquired a national reputation under this first VILMORIN, and its influence and business relations have increased from that day to this. The elder VILMORIN died in 1804, previous to which time his son, PIERRE PHILIPPE ANDRÉ, became a partner in the business. This son established comparative field tests of plants, and he introduced many of the trees and shrubs collected in North America by his friend, the eminent botanist MICHAUX. He established an arboretum, rich in American Oaks, which, after his death in

FIG. 40.—VINE DISEASE—"BRONNING"—THE EFFECT OF A SLIME FUNGUS.

1862, the French Government made the foundation of a national school of forestry. He retired from business as early as 1845, and left the house in the hands of his eldest son, LOUIS LEVÊQUE DE VILMORIN. LOUIS gave much attention to the subject of heredity in plants, and his writings in this direction are still well known to scientists. His name is also identified with the amelioration of the Sugar-Beet. He died in 1860, at the age of forty-four, and his widow assumed a great part of the management of the business. The house is now in the hands of the two sons of LOUIS, HENRI L. and MAURICE L. DE VILMORIN, the latter of whom is secretary of the French horticultural division of the Columbian Exposition. A young son of HENRI has lately appeared before the public in the excellent little book, entitled *The Flowers of Paris*.

PUBLICATIONS RECEIVED.—*Report of the Chief of the Division of Vegetable Pathology*, by B. T. GALLOWAY.—*Experiments with Fertilisers for the Prevention and Cure of Peach-yellows*, by ERWIN F. SMITH (Washington).—*The Flora of South-West Surrey*, by S. T. DUNN, B.A. (WEST, NEWMAN & Co.)—*Icones Orchidearum Austro-Africanarum, &c.; South-African Orchids (Extra tropical)*, by HARRY BOLUS, F.L.S., vol. i., part i. (WESLEY & SON, 28, Essex Street).

VINE DISEASES.

(*Brunissure, Browning.*)

In his humorously-pathetic paper on the enemies of the Vine, read at the Grape Conference at Chiswick on September 24, 1890, Mr. R. D. Blackmore called attention, among other things, to two diseases, the one Anthracnose, the other unnamed. Here is Mr. Blackmore's description of the last-named disease, which for some reason he did not like to be called Blackmore's disease, "Morbus Blackmoreanus":—"The tip of the shoot is first attacked, and the crinkle of the unexpanded leaf, which becomes of a dirty wash-leather colour, and loses its pellucidity. Then the leaves that are expanded further down the shoot become cupped and concave on the lower side, convex on the upper, and lose their graining. All the shoot becomes dull, and its crispness is gone; and if pinched, it indents without breaking. The disease, unless checked at the outset, descends the stem very quickly, runs into the older wood, and destroys the Vines. Mr. Blackmore went on to narrate how, after having tried various fungicides, he stopped the plague by dipping the shoots into the strongest liquid-manure. Specimens of this disease were sent to us from numerous sources, as well as from Chiswick, and they were submitted to several specialists, but it was not until last year that any definite conclusion was arrived at. Mr. Massee of Kew then told us he was on the track, and this year he reports with confidence that the disease is caused by one of the slime-fungi (*Plasmodiophora vitis*), closely allied to that which produces fingers-and-toes in Turnips, and clubbing in Cabbages and Wallflowers. This fungus, if fungus it be (for there has been much dispute whether the myxomycete to which group our enemy belongs), is now known to be the cause of the disease called "Brunissure" in France. This pest was first noticed in that country in 1882, by M. Pastre, who thought it due to a coccus or scale insect, which attacks the leaves. Its true nature, however, is fully described, with numerous illustrations, in M. Pierre Viala's *Les Maladies de la Vigne*, Paris, on, pp. 400, t. xii. At fig. 40, we give an illustration of the outward appearance of the tip of a young shoot affected with this disease. All diseased parts should be cut away and burnt, or Mr. Blackmore's experiment be repeated. At first sight it would seem as if the treatment he recommended was more likely to be propitious to the development of the fungus than otherwise; but possibly there may be too much of a good thing, and excess may produce evil consequences on slime fungi as on other things.

ANTHRACNOSE, a disease mentioned in Barron's *Vines and Vine Culture*, was at one time considered as identical with that just mentioned. The two are, however, different. As this most destructive disease has again appeared in a virulent form in this country, we shall refer to it more fully on another occasion. It is fully described in M. Viala's treatise, already cited, and specimens were submitted to the Scientific Committee at its last meeting, and will be reported on in due course by Mr. Massee.

HOME CORRESPONDENCE.

GILBERT WHITE CENTENARY.—I have received the following communication from F. Read, Esq., the present owner and occupier of Gilbert White's house, where he lived and died, viz., The Wake's Selborne. Mr. Read writes, "May I appeal to any of your readers who are lovers of Gilbert White for their support to the following scheme:—In hot summers, Selborne always suffers severely from scarcity of water; the wells, which are all surface ones, run dry, and the villagers have to fetch all their water from the celebrated well-head, which is more than a mile distant from some of them." We propose, if money enough can be raised to place a ram at the well-head, which will pump the water up to four stand-pipes placed at convenient spots in the village. The engineer's estimate for this work is £300, of which we have collected £35, and had promised £10 or £15 more. It is impossible to do the work ourselves, as beyond the vicar and myself there are no residents. Subscriptions would be gratefully

acknowledged by the vicar, Rev. W. O. Peile, Selborne Vicarage, Alton, Hants, or by F. Read, Esq., The Wakes, Selborne. I most heartily support this appeal; I have lately remained nearly three days at Selborne, and had a long and interesting conversation with the vicar and the squire, Mr. Read, upon the absolute necessity which exists for a good water supply for the poor. It seemed to me a happy thought to celebrate the Gilbert White centenary, in memory of one whose letters on natural history will survive to the end of time. *John Colebrook.*

ITALIAN MULLEINS—I have found at Viareggio, a sea-bathing place, a very pretty and sweet-smelling Mullein, of which I enclose a couple of flowers, as well as of the more common species. The larger and sweet-smelling kinds are comparatively rare here, whereas the smaller are innumerable. Both seem to love the sandy soil, for all the space between the sea and the hills, a belt of some 2 or 3 miles, was in Roman times the sea. A firm belt runs along the sea-shore, created by the great main road, and later by the railway, inside of which is a curiously marshy area, partly composed of the Lake of Montecccoli, and partly of narrow strips of land divided into exact parallels by ditches, with here and there broad navigable canals—a veritable southern Netherlands. In this I saw lively Hollyhocks of brilliant rose, but separated from me by impassable ditches. The whole of this country is a profuse collection of aquatic plants, and very beautiful they are. *H. J. R.* [The flowers enclosed were those of a *Verbascum* and of a *Celsia*, probably *C. cretica*, which is described as "odoroso," and as being found in "Sicilia ed in Sardegna." *Althæa rosea* is said to occur on hills and in woody places in central Italy and the Basilicata, and to be "coltivata comunemente per ornamento." Ed.]

THE WASP PEST.—I have never known such a number of wasps in my experience before; they really swarm around the walls and in the fruit-houses, particularly the Fig-house and the Muscat-vinery. Goose-berries and Currants that we usually keep far away into the autumn, are nearly all gone, through the wasps that get into the nets. I have tried several preparations, but none seem really effectual. We are gathering the Plums as fast as they ripen, and the others we protect with tiffany and coarse linen by entirely covering them; the same has been afforded to Morello Cherries. We have also nailed the same material over all the ventilators of the vineries, top and bottom, and even then we have to be exceedingly cautious, or they shoot in when the door is open. A man from the kitchen garden goes out at night to destroy the nests, and we pay him 6s. each nest. His operations do not commence till dusk, when the wasps have retired. He places a squib in the hole leading to their nest, and then a spadeful of earth to fill the hole up till they are suffocated. Afterwards he digs the nest out, and with the spade smashes up the comb and brood. Just round about the gardens and lawns he has destroyed 150 nests this season, and apparently he will destroy as many more. We also catch a good many by large bottles, in which is placed some sweet beer; we catch hundreds of them daily by this process. There have been cases in this district where they have attacked sheep and horses with such venom as to kill the animals. *W. A. Cook.*

LUISIA AMESIANA.—Having read in the *Gardeners' Chronicle* of July 8 an account of *Luisia Amesiana*, also Messrs. Hugh Low & Co.'s letter of July 15 on the same subject, I write to say that I received two plants of this Orchid in 1888, sent direct from Burmah by a relative who was quartered with his regiment there. The plants were obtained with some *Vanda Kimballiana* and other things from an Orchid collector, and sent direct to me, where they flowered every year, and sometimes twice in a year, until I exchanged them with Messrs. Sander & Co., in the autumn of 1891 for other Orchids which suited me better. I was under the impression that they were *Luisia Psyche* until I saw the drawings in your issue of July 8, which clearly showed them to be *Amesiana*. As my plants passed into the hands of Messrs. Sander & Co., very likely the plant exhibited by Sir Trevor Lawrence may be one of them. *Alfred E. W. Darby, Little Ness, Shrewsbury.*

THE APPLE AND PEAR CROP.—These are all ripening, even some of the late kinds are very much advanced. I think we shall be obliged to get the greater crop of Apples in toward the end of the present month. We have some Court Pendu Plat,

an Apple in great favour here, and which we usually store about the first week in October. These are already ripe. Blenheim and Ribstons are likewise ripe in the open, and a great many are destroyed by the wasps; in fact, it is extremely difficult to gather them, the wasps are so numerous. Williams' Bon Chrétien, which, as a rule, carries us along till the end of September, will soon be all gone; this Pear is unusually fine this season. Louise Bonne of Jersey is also ripening, and has a splendid colour; in fact, a great many varieties of both Apples and Pears must be harvested this month. *W. A. Cook, Compton Bassett.*

MELON INGESTRE HYBRID.—Last week, in looking through the gardens at Ingestre, where fruits of all kinds are so well grown, I was much impressed with the new Melon Mr. Gilman has raised by crossing Hero of Lockinge with Countess, the result being a hybrid of great excellence; the constitution of the plant is strong, it is a good grower, and a free setter. Fruit beautifully netted, of a bright golden-yellow colour, thin skin, and shows no tendency to crack. The flesh is greenish-white, of great thickness and flavour. Several houses are planted with this variety. Fruits were seen in various stages of growth. One house, containing eight plants, had from thirty to forty ripe fruits, averaging from 3 lb. to 5 lb. each. Ingestre Hybrid promises to be one of the best Melons ever sent out. It will prove a boon to the grower for market, for the exhibition-table, and indeed wherever Melons are grown this should find a place. It was awarded a Certificate of Merit at the meeting of the Royal Horticultural Society on May 9. The stock is in the hands of Messrs. Veitch & Sons, Chelsea, for distribution. *Robert Cook, F.R.H.S., Horticultural Lecturer, Staffordshire County Council.*

—Through a slip of the pen the above Melon was last week called The Countess, a variety sent out, I am told, by that excellent fruit grower, Mr. Goodacre. Ingestre Hybrid is the result of crossing The Countess and Hero of Lockinge, and it was the hybrid that I described in last week's issue. *J. Dale.*

ROOT-PRUNING.—The letters which have so far appeared in the *Gardeners' Chronicle* in reply to Mr. Crowley's note on the above subject, to a certain extent agree that root-pruning should be practised to bring about fruitfulness in trees which, owing to gross growth, have borne no fruit. This intention I take as being universal with all fruit-growers who possess a practical knowledge of the cultivation of fruits. It is, I think, to be wondered who would go to the labour and expense of root-pruning trees that bear good and regular crops of fruit. What would the object be for doing so? Then again what practical man would root-prune his orchard trees at six years old and every alternate year afterwards. Such practice, I think, was never advocated by the old school of gardeners. Mr. Molyneux, at the beginning of his article, says, "I am sure root-pruning is too much resorted to, I allude to those persons who may be called the older school of gardeners, and that there is certainly less root-pruning done now-a-days;" and again, Mr. Goddard says, "I fear that because the old school of gardeners practised severe root-pruning the younger men may follow suit." Now, I think, that in reference to these remarks, there has been, or is, at the present time a class of gardeners who pride themselves in hacking at the roots of their trees regardless of what they are doing, but surely it does not follow that the younger gardeners are as unwise. I take it to be that at the present time never was root-pruning more practised with unfruitful trees, and never was the art better understood; and further, I think it would be well for any novice, before he commences to hack at the roots of his young, healthy, and promising standard trees, to consult some good nurseryman, practical gardener, or fruit-grower. In Kent, the soil and climate generally are good for fruit-growing. This being so, it is very seldom that an orchard tree requires root-pruning after it has been properly planted; but there are, however, cases similar to that mentioned by Mr. Molyneux where the roots must be cut; but it will be quickly observed by any practical fruit-grower whether the trees will soon reach a fruiting condition or not. Some trees from the very first incline to grossness, while others begin to fruit the second or third year after they are planted. Where grossness repeats itself year after year, I say by all means root-prune, but do this with care. A standard from six to eight years of age should be operated upon only on one side during the one year; and this is best done by opening a trench 2 feet wide half-way

round, and at a distance of from 3 to 4 feet from the stem. Dig deep enough to get under some of the main roots, remove the soil as the work proceeds, gradually working to the tree; preserve all the roots possible, and sever any strong descending root which may have got down in the cold subsoil; this having been done, break up the subsoil, cut off all the tips of damaged and broken roots, and relay them evenly at various depths, using the same soil, or a little fine soil may be scattered over and amongst the roots, should the staple be wet and heavy. This should be done in early autumn, and the following year the other half should be treated. Though I have said that the soil and climate of Kent is good for fruit-growing, and that it is rarely root-pruning of orchard trees is required, yet these remarks apply to many parts in the south. And what of the north and the more unfavourable parts? I feel sure it would be very interesting to readers generally if some of our northern friends were to give us their experience of root-pruning standard fruit trees. *H. Markham, Mereworth Castle, Kent.*

RICHARDIA LUTWYCHEI.—I am sorry not to have replied to "Inquirer's" question concerning the distinctness of this plant, published in the issue of June 17, but in some way I overlooked it. I have seen but the one plant of *R. Lutwychei*, from which I described, and on comparing it with the material in the Kew Herbarium, I found it readily distinguishable from all by the characters given. But I was in error in stating by implication that *R. hastata* has no bristles on its petioles; none being observable on the dried specimen I did not think of comparing it with the living plant, which I had not seen for some time, and had forgotten that it had any setae on the petioles. Having now done so, I still think that *R. Lutwychei* and *R. hastata* are distinct, although closely allied species; this opinion, however, is based on a very meagre knowledge of *R. Lutwychei*, and I must leave it for those who have the two plants in quantity to definitely dispose of the question as to their distinctness. The difference which appears to me the most pronounced is, that the leaf of *R. Lutwychei* is rather larger than that of *R. hastata*, and different in shape, on account of the basal lobes overlapping one another, which (I am informed from two sources) is always the case in adult leaves of *R. Lutwychei*, but I do not find it so in *R. hastata*. There is also the very wide separation of the two localities from which the plants come, and this alone would make one suspect that they are two species, although in this case it may not in reality be so. This point I leave for others to decide. As to *R. melanoleuca*, that is at once distinguished by its white-spotted leaves, besides other differences. *N. E. Brown.*

A MONSTER PEACH TREE.—It is my good fortune to have the privilege of visiting many of the principal estates and nurseries in the counties of Durham and Northumberland, and amongst my many calls, none I think afford me more real pleasure than my occasional visit to the residence of F. Stobart, Esq., principal agent to the Earl of Durham's mining and other estates. Situate within a stone's-throw of the beautiful country seat of the Lambtons, Beddick Hall is peculiarly pleasantly located, and is delightfully picturesque in its appearance from the front terrace, with its winding walks and handsome clumps of Rhododendrons, of leviathan size and proportions, lifting themselves, as it were, majestically above a well-trimmed velvety-green carpet, surrounded by huge lofty trees as a background. Mr. Archibald Scott, the head gardener, generally has something unusual for the visitor's eye, and the great Peach tree is a sight seldom, if in fact ever, to be seen here in the North of England. Proceeding alongside the vineries, which is one long terrace of glass divided into sections, everything is in perfect order. At the extreme end of this is to be seen the Peach tree, which is the principal reason of my troubling you with this article. The tree is fully 23 feet long by 17 feet deep, and is of the Royal George variety. Its foliage is beautifully green, and presents a most healthy and perfectly clean appearance. Suspended from its branches are no less than 420 good-shaped Peaches, of inviting colour; the average weight of this fruit is from 6 to 8 oz. The age of the tree is about fourteen years, and it continues to make great growth. On each side of this tree are two smaller ones—another Royal George and a Princess of Teck. These two trees, I noticed with regret, are being mutilated annually to make room for the expansion and growth of the larger one. Of the Princess of Teck I wish to say a few words: the fruit hanging

on the tree here grown is very fine, the heaviest samples weighing from 9½ to 10½ oz. The colour of the fruit and the flavour are all that can be desired. These Peaches are certainly a great credit to Mr. Scott. A. Y. Z.

NOTES FROM KEW.

THERE are some noteworthy plants in flower at Kew now, both indoors and out, where, notwithstanding the dryness of the season, the plants generally are looking well. The exception is the annuals, which, both in the herbaceous ground and the borders, are generally a failure this year.

Aristolochia gigas Sturtevantii is flowering freely again, both in the Palm-house and the Water-lily-house. The latter house is now at its best, the Gourds being in fruit, and the other roof-climbers in flower, Solanums, Passion-flowers, Allamanda,

with the most graceful effect from the under-side of the branches. *Pueraria Thunbergiana* is in fine condition there. The species of *Fuchsia*, too, are worth looking at, as are also several species of *Echium* from Teneriffe, and some well-flowered little plants of *Tecoma radicans*.

Victoria regia is strong and floriferous this year; so too is *Euryale ferox* in the same tank. That grand foliage plant, *Macaranga* or *Mappa Porteana*, is in fine health, and is coming into flower. This deserves to rank with the handsomest of large-leaved plants for cultivation in big stoves. *Ixora macrothyras* (Duffii), *Thunbergia grandiflora*, and *Adenocalymna nitidum* are conspicuous for their flowers in the same house. The double Cocoa-nut is growing and flourishing, and there is a fine crop of pods on a *Vanilla* plant trained over the tank.

Orchids are busy growing now, but there are a few choice species in flower, viz., *Lælia monophylla*,

noticed the pruners at work on the trees in the arboretum, and that the work they are doing in good gardening is apparent enough in the improved appearance of the trees operated upon last year. There are two big specimens of *Dasylium acrotrichum* in flower, one in the temperate-house, the other in the succulent-house.

WILLIAM THOMSON.

WE have now the opportunity of reproducing a photograph of the late Mr. William Thomson, of the Tweed Nurseries, Clovenfords, Galashiels, N.B., whose obituary notice was published in our issue for August 5, p. 167. Mr. Thomson was very highly respected by all who knew him, and very great sympathy has been expressed towards Mr. W. Thomson, senior, who has met with so sad a bereavement in his 80th year, and towards the widow and family of the deceased gentleman.

NOTICES OF BOOKS.

LA FUMURE DES CHAMPS ET DES JARDINS, &C.
Par L. Grandeau.

THIS is a little treatise on the principles and practice of manuring, whether with natural or artificial means. It is largely based on the chemical and experimental researches of Lawes and Gilbert, Wagner, and others. The application of nitrogen, phosphoric acid, and potash in quantities, and in manners suitable to different conditions and different objects, is treated of with skill and lucidity. The general principles of manuring, in fact, are well explained, and this is all that can be expected in a book, their application can only be properly appreciated by direct experiment. In this connection, M. Grandeau lays great stress on "Champs de démonstration," or illustrative examples. Whilst commending experimental plots for the purpose of acquiring information, and the results of which may be good, bad, or indifferent, according to circumstances, M. Grandeau strongly advocates the establishment of illustrative plots whereon the gardener or the farmer may see for himself the advantage accruing from the use of a particular manure or a certain method of treatment. The ordinary gardener cares nothing for experiments, often derides them, generally misapprehends their object, but if you can show him the outcome of many experiments in the shape of successful result which appeals to his financial interests, rather to his intelligence only, the case is different. So soon, therefore, as by trial and experiment, a good result has been surely arrived at, that result should be demonstrated in the trial grounds, so that everyone concerned may see for himself. Of course, for purposes of demonstration, the demonstration plot should be side by side with one treated in the ordinary way, and with one to which, at any rate, no manure at all has been applied.

Some day we may hope for a properly equipped and adequately manned school of horticulture, when these requirements could be easily met and effectively controlled.

Chiswick is the proper place for a beginning, but failing this, the various County Councils in the rural districts could readily carry out a scheme of this kind.

SEMER ET PLANTER, ETC.

A second edition of this useful book more than confirms our good opinion of the first. It may be well to remind the reader that this is a treatise on the rearing and planting of timber trees, and that it is based on the practical experience of Mr. D. Cannon, an Englishman settled in Sologne, near Orleans, in a district spoken of as one of the most impoverished in France (deshérité is the word used), but which by judicious planting is rapidly increasing in value, and in spite of many disasters has attained a condition of relative prosperity, which is continually increasing. Forestry is thus a precious resource for agriculture, as a means of turning to profitable account lands

THE LATE WILLIAM THOMSON, OF CLOVENFORDS.

Clitorea, *Dipladenia*, as well as the *Aristolochias*, being conspicuous for their wealth of bloom. The *Nymphæas* also are good this year. *Nelumbinus* have not flowered well. The male plant of the Ivory-nut Palm, *Phytelephas macranthera*, flowered in the Palm-house a few days ago, the inflorescence a curved spike 18 inches long, produced near the ground, and clothed with closely-packed filaments as thickly matted as a door-mat. It was yellow, and powerfully fragrant. There is a new *Crinum* in flower in one of the beds, a stately plant, 5 feet high, with three spikes, bearing each a large umbel of white flowers, with long, narrow, curling segments. *Lonchocarpus Barteri* on the rail surrounding the gallery, *Aristolochia brasiliensis* in the same position, and the black-flowered, Grape-like *Mucuna imbricata*, are also in flower in this house. *Bignonia purpurea* and *B. rugosa*, the former purple, the latter pale yellow-flowered, are two species worth including among select summer-flowering stove climbers. In the temperate-house there is a splendid specimen of *Cyphomandra fragrans*, a superb plant for large conservatories, as it grows rapidly, and is every year clothed with racemes of flowers, some purple, some yellow, all hanging

Sobralia xantholeuca, *Aërides Sanderianum*, *Vanda cœrulea*, *Cypripediums*, &c.

In the stove, *Ataccia cristata* is in flower, the *Myrmeceodia* and *Hydnophytums* are growing vigorously, and the creepers on the roof are worth looking at. *Begonias* are represented by a large collection of healthy specimens, some of which, such as the *B. Haageana*, *B. Scharffii*, *B. coccinea* (corallina), *B. Kewensis*, and *B. semperflorens* vars. are now gay with flowers. The *Belladonna Lilies*, *Lilium Henryi*, *L. tigrinum*, *L. speciosum*, and *L. auratum* are now worth seeing, and the *Campanula pyramidalis* and *Lilies* are specially good in the conservatory. *Iibiscus syriacus* in the arboretum is showing the effects of a tropical summer by flowering freely, and the Tea and Noisette Roses were never finer. The blue Himalayan Poppy has been a feature in the rock garden for several weeks, and the pretty *Zauschneria californica* is flowering freely still.

In conclusion, a special line must be given to the Bamboo garden, where the Bamboos have made wonderful growth, and astonish everyone, gardeners included, by their variety, free growth, and elegance. Clearly this collection of hardy Bamboos at Kew is a most valuable horticultural object-lesson. We

which otherwise would be unfitted for cultivation. We cordially commend this volume to all planters as a practical treatise based on large experience. It may be had from J. Rothschild, 13, Rue des Saints Pères, Paris, or through any foreign bookseller.

SOCIETIES.

LEICESTER HORTICULTURAL SHOW.

AUGUST 8.—This show is always well patronised by the public if the weather is fine, and this year it was estimated that nearly 30,000 people attended. Many attractions are provided in the way of music, aquatic sports, gymnastics, &c., and the gardens are well worth a visit at any time; and although the season has not been a favourable one, Mr. Burn has succeeded in making a good show with the flowerbeds, and the recent rains have helped the grass to regain its usual appearance.

The groups of plants were arranged in a new show-house, lately erected from the profits of the Society, and costing £700. This will be a grand place for flowering Chrysanthemums in the winter. The 1st prize was awarded to Mr. J. Smith, gr. to Mr. S. Bennett, for a pretty arrangement, brightened with *Eulalia japonica*; Mr. Barry, gr. to Mr. H. Snow, won the 2nd prize; and Mr. Calvert, gr. to Mr. G. Olliver, 3rd. The zonal *Pelargoniums* and *Begonias* were arranged down the sides of this house, and the whole looked very tasteful.

For the fruit prizes there was a strong competition in most of the classes. The 1st prize for a collection of eight dishes was easily won by Mr. J. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, Derby, who showed Black Hamburg Grapes (fine in bunch and berry), good Muscat of Alexandria, and nice clean bunches of Madresfield Court; Melon Best of All, a Queen Pine, some good Lord Napier Nectarines, Peaches, and Apricots. 2nd, Mr. Jas. McIndoe, gr. to Sir J. W. Pease, Hutton Hall, Gutsborough, Yorkshire, who showed fine large bunches of Grapes, a large bunch of Bananas, very fine Pitmaston Duchess Pears, &c.

In the collection of four dishes, Mr. J. Goodacre was again 1st, showing some fine Muscat Hamburg Grapes, a Melon, Nectarines, and Peaches; 2nd, Mr. W. H. Divers, gr. to J. T. Hopwood, Esq., Ketton Hall, Stamford, who was a few points behind with Grapes, but had Peaches and Nectarines very fine.

For Black Hamburg Grapes, Mr. McVinish was 1st, showing in grand style; 2nd, Mr. J. Goodacre. And for any other black variety, Mr. W. Messenger was easily 1st, with Gros Maroc, grand in berry and colour; 2nd, Mr. W. G. Adams, with Gros Colmar, fine berries.

For Muscat of Alexandria, Mr. McVinish was 1st; and for any other white variety, 1st, Mr. J. Read, gr. to the Earl of Carnarvon, with Canon Hall, having fine large berries; 2nd, Mr. J. Goodacre.

Mr. W. H. Divers was 1st for Peaches, showing Crimson Galande—fine fruit, highly coloured.

Nectarines.—1st, Mr. W. H. Divers, with Dryden, large, well-coloured fruit; 2nd, Mr. J. H. Goodacre, with Lord Napier; 3rd, Mr. J. McIndoe, with Spencer, Cherries, Currants, Plums, and Apples were largely represented.

Some grand vegetables were shown. For a collection of twelve kinds, Mr. Garraway, of Bath, was 1st, with a very fine collection, nicely arranged with leaves of Carrot, coloured, and Parsley. The single dishes also brought some very fine specimens, especially in Potatoes, Carrots, Onions, &c.

A large number of Roses was staged. For thirty-six kinds, Messrs. Cocker & Sons, of Aberdeen, were 1st, showing well for the season; Messrs. Croll, of Dundee, 2nd; Messrs. Harkness & Son, Bedale, Yorks, 3rd. For twenty-four kinds, the same exhibitors won, and in the order given for the larger class.

A large number of hardy herbaceous flowers was staged. Messrs. Cuthbertson, of Rothsay, were awarded a Silver Medal for an exhibit of these, not for competition.

Messrs. B. S. Williams & Son, of Holloway, staged a fine group of new and rare plants, not for competition. These were deservedly awarded a Gold Medal, and consisted of *Nepenthes*, *Caladiums*, *Crotone*, *Sarracenias*, &c., with some choice *Orchids*.

Messrs. J. Laing, of Forest Hill, also contributed

a very interesting group of *Bertolonias*, *Begonias*, *Gloxinias*, *Palms*, &c., a box of very fine *Begonia* flowers and a new *Carnation*, Stansted Beauty (Gold Medal).

Mr. Forbes, of Hawick, sent a fine collection of border *Carnations*, arranged in bunches, which were very pretty and fresh. A Silver Medal was awarded to them.

The cottagers showed a creditable lot of vegetables, many of which would have fared well if exhibited among professional growers.

TAUNTON DEAN HORTICULTURAL.

AUGUST 10.—The Taunton Dean Horticultural and Floricultural Society held its 26th annual exhibition of plants, fruits, flowers, and vegetables in Vivary Park, Taunton, on the above date, under most favourable circumstances. The management of the show reflected great credit upon the courteous hon. secretaries, Messrs. Howard Maynard and Alex. Hammett. Plants were shown in fine condition by Mr. James Cypher, Mr. W. Brock, and Mr. Peel, gr. to Miss Todd, Lidford Lodge, Shirley.

Prizes of £20, £15, and £8 were offered for twelve stove and greenhouse plants in flower. Out of three lots shown, Mr. Cypher was a good 1st, staging, among others, grandly-flowered plants of *Erica Everiana*, *E. Altoniana*, *E. Austriana*, *Dipladenia amabilis*, *Allamanda Hendersonii*, *A. nobilis*, *Anthurium Scherzerianum*, *Bougainvillea glabra*, *Ixora Pilgrimi*, *I. Williamsi*, and *Dasyliirion acrotrichum*. Mr. J. W. Mould, of Pewsey, was 2nd, showing in his collection a grand plant of *Erica Everiana superba*, fresh, and profusely flowered. Mr. Cypher was 1st in the class for six stove and greenhouse plants in flower, staging similar exhibits to those mentioned above. In the class for eight fine foliage and variegated plants, Mr. Cypher was well ahead with large brightly-coloured *Croton Chelsoni*, *C. Thomsoni*, *C. Mortefontaineensis*, *Cycas circinalis*, &c. Mr. Brock was a creditable 2nd.

Orchids.—Mr. Cypher was 1st for four plants of *Orchids*, *Cattleya aurea* and *C. Gaskelliana*, having five and eleven flowers respectively, were his best. The same exhibitor was also 1st in the class for newly-introduced plants, staging nice pieces of *Dendrobium Phalenopsis delicata*, and *Cattleya Victoria reginae*.

Ferns.—Mr. Brock was a good 1st for eight Exotic Ferns, showing good-sized fresh well-grown plants.

Groups of miscellaneous plants arranged for effect on a space of 100 square feet, made a fine show in themselves.

Mr. Brock was 1st for a light and tastefully-arranged group, edged with *Panicum variegatum*; *Palms*, and *Humea elegans* being used in the background with bright-coloured *Crotons*, *Celosias*, *Cyperus alternifolius variegata*, *Francoa ramosa* (Bridal Wreath), and other suitable plants, set in a ground-work of Maidenhair Fern, the arching spikes of the *Francoa* showing off to advantage in the arrangements; Mr. Peel was a good 2nd.

Cut Flowers.—These classes were well filled. The *Roses* and *Dahlias* staged by Messrs. Keynes, Williams & Co., Salisbury; Dr. Badd, Bath, and Mr. George Humphries, were very fine indeed. Lady Mary Fitzwilliam, Mrs. John Laing, John Hopper, and Niphetos, were exceptionally good in Messrs. Keynes's 1st prize stand of thirty-six *Roses*, distinct varieties. This firm was also awarded 1st prize for twelve blooms of Fancy *Dahlias*, and 1st for a stand of the *Cactus* varieties in six sorts.

Mr. Hawkins, gr. to W. H. Fowler, Esq., Claremont, Taunton, was a capital 1st for twenty-four spikes of *Gladioli*, in not less than twelve varieties.

Fruit.—All the fruit classes were well-contested, and the exhibits were very meritorious in size, quality, and finish.

Six collections of eight kinds (*Pine* excluded), were staged in exceptional quality. Four of these were very close to each other in point of merit. Mr. William Iggulden, gr. to the Earl of Cork, Marston House, Frome, was placed 1st, staging medium-sized, compact, well-coloured bunches of Muscat of Alexandria and Madresfield Court Grapes, Bellegarde Peaches, Jefferson's Plums, Pine-apple Nectarines, Moor Park Apricots, a Melon, and Williams' Bon Chrétien Pears. Mr. Lloyd, gr. to Vincent Stukeby, Esq., Langport, was a dangerously close 2nd, and Mr. Crossman, gr. to J. Brutton, Esq., Yeovil, was a capital 3rd, both staging heavier produce than Mr. Iggulden. The same exhibitors were placed in the above position for collections of four kinds,

Mr. Iggulden showing well-finished Madresfield Court Grapes, Lockinge Hero Melon, Bellegarde Peaches, and Elruge Nectarines.

Out of six stands of three bunches of Black Hamburg Grapes, Mr. Iggulden was 1st, with medium-sized, well-coloured bunches. Mr. H. W. Ward being 1st in a like competition for any other black variety, staging well-coloured bunches of Madresfield Court; Mr. Iggulden was a close 2nd with the same variety. Mr. Iggulden was 1st for three bunches of Muscat of Alexandria, Mr. Lloyd being a good 2nd; and Mr. T. Crossman was placed 1st for three bunches of Buckland Sweetwater shown in any other White Grape class.

Out of fourteen dishes of Peaches staged, Mr. John Reed, gr. to J. S. Parsons, Esq., was 1st. Mr. A. Crossman being accorded a like position for Nectarines, staging capital Pine-apple.

Mr. T. Every, Bath, was awarded premier position for six dessert Apples out of twenty-five lots, showing handsome fruits of Beauty of Bath. Mr. David Hobby, gr. to the Right Hon. Sir Ponsoby Fane, Brympton, Yeovil, was a capital 1st in the class for dessert Pears, showing handsome fruits of Williams Bon Chrétien. Mr. John Allen, gr. to the Rev. W. L. Cotton, West Coker, Yeovil, had the best-flavoured Melon. Mr. Iggulden had the 1st prize for yellow Plums, showing Jefferson's; and Mr. A. Crossman obtained a like honour for dark Plums, staging a capital dish of Grand Duke.

Vegetables made a grand display, the entries being numerous, and the quality of the several exhibits was of a high order. Out of six excellent collections of eight kinds, Mr. Wilkins, gr. to Lady Theodora Guest, Hensbridge, was 1st, staging fine specimens of Sutton's Satisfaction Potato, Ne Plus Ultra Runner Bean, Autocrat Pea, Giant White Celery, Autumn Giant Cauliflower, Ponderosa Tomato, Excelsior Onion, and Intermediate Carrot. Mr. Copp, gr. to W. S. Earle Drax, Esq., Huldnest, Sherborne, was a close 2nd. The positions of the exhibitors just mentioned were reversed in Messrs. Jarman's prizes offered for collections of twelve kinds. Mr. Copp was also 1st for Messrs. Sutton's prizes given for collections of six kinds, staging excellent examples of Sutton's A1 Onion, Satisfaction Potato, Autumn Mammoth Cauliflower, Perfection Tomato, Giant White Celery, and Intermediate Carrot.

Mr. H. W. Ward was an easy winner of 1st prize for a quarter-peck of Peas, with fine fresh pods of Veitch's Autocrat.

Messrs. Robert Veitch & Son, Exeter, showed their climbing French Bean growing in a pot. This variety attains to a height of 6 or 7 feet, and produces with great freedom long straight handsome pods from the bottom to the top of the bine.

Miscellaneous.—Mr. B. R. Davis, Yeovil, staged an excellent lot of *Begonias* in pots, and also some cut blooms, the latter being of great size, fine form, and of a variety of pleasing and distinct shades of colour. Messrs. Kelway & Sons, Langport, contributed *Gladioli* and herbaceous plants in variety. Messrs. Robert Veitch & Son showed a collection of *Liliums* and herbaceous and alpine plants in great variety, their exhibits making a grand show on the centre stage at the end of one of the several large tents.

MAIDENHEAD HORTICULTURAL.

AUGUST 10.—This show was well worthy of the district in which it was held.

Plants.—In some classes the competition was not so keen as usual, but the quality left nothing to be desired in any case. For twelve foliage plants in 8-inch pots, Mr. Lockie, Windsor, was 1st, with well-grown healthy examples, *Palms*, *Crotons*, and *Pandanus* predominating.

With six stove and greenhouse plants, three to be in flower, Mr. Aitken, gr. to Major Meeking, Riving's Park, was 1st, all the flowering plants being white ones; these were a *Stephanotis*, a *Eucharis*, and *Schubertia grandiflora*.

With six Ferns, Mr. Aitken occupied the same position, with grand plants of *Davallia Mooreana*, *D. filix-plumosa*, and *Microlepia hirta cristata*, with others. Mr. Jakeman, Riverdene, Cookham, followed, with a rather uneven lot.

Mr. Aitken was 1st for both a flowering and a foliage specimen, showing in the first instance a good *Dipladenia amabilis*, and in the latter a grand example of *Croton Queen Victoria*.

With table plants, Mr. Johnson, gr. to A. Gilliatt, Esq., was 1st, with excellent examples, well-furnished. Finely-flowered *Fuchsias* were shown by Mr. G. Hopkins, gr. to J. W. Burrows, Esq., which gained him the 1st prize.

Tuberous Begonias were shown in grand style in three classes, the best lot coming from Mr. A. Deadman, Intheray, Maidenhead; these were all large specimens of fine varieties. The finest six Cockscombs were from Mr. Lockie; these were extremely dwarf and sturdy, with large combs. A very fine exhibit was the half-dozen zonal Pelargo-

Fruit.—The best collection of six dishes was that staged by Mr. E. Johnson, who was strong in Madreafield Court and White Muscat Grapes, Crawford's Early Peach, and Balgowan Nectarines. Mr. Goodman, gr. to Miss Hammerley, coming a close 2nd, the best dishes here being the Muscat Grapes and Lord Napier Nectarines.

Peach. The best Nectarines those of Elruge from Mr. Paxton.

Mr. Osman, gr. to L. J. Baker, Esq., Otterahaw Park, was the most successful exhibitor in the Grape classes, being 1st for Black Hamburgh, with large bunches, finely coloured, the same for any other black, with splendid Black Alicantes, and for

FIG. 42.—LELIA TENEBROSA, WALTON GRANGE VARIETY.

Fully described at p. 179, *ante*. Sepals and petals citron-yellow, lip white, veined with crimson, and with a central blotch of the same colour.

riums from Mr. Aitkin; these were large, but dwarf, and in dense bloom. Well-grown Coleus came from Mr. Jakeman and Mr. Hopkins respectively, the prizes going in the order named.

In the large group class, Mr. Aitkin was easily 1st with a most effective arrangement, light flowers and foliage being carefully blended. For a smaller group, Mr. John Smith, St. Leonard's Road, was 1st, the plants extremely healthy.

For four dishes, Mr. D. Paxton, gr. to Hon. C. Irby, was 1st, all being good of their kinds.

Hardy fruits in collections of four dishes always produce a keen competition; Mr. Johnson was 1st on this occasion, his choice being Williams' Bon Christian Pears, extra fine; good Humholdt Nectarines, Kirke's Plums, and Crawford's Early Peaches.

The finest dish of Peaches was that from Mr. McPhun, extra good examples of the Nectarine

any other white with Foster's Seedling. The finest Muscats were those from Mr. G. Goodman.

Apples, both dessert and culinary, were shown well, Mr. John Davis, gr. to General Davies, and Mr. Aitkin, taking the 1st in each class.

Vegetables.—These are always an important feature. In two special classes for Messrs. Suttons' and Messrs. Webbs' prizes, Mr. Lockie scored two splendid 1sts, the competition in the former class

being the more keen of the two. Autocrat Pea, Perfection Tomatoes, and Satisfaction Potatoes, were the finest in that class by Mr. Lockie; Mr. McPhun followed an excellent 2nd.

The classes for amateurs, garden-labourers, and cottagers, were all well filled, in spite of the dry season.

Cut Flowers.—Mr. J. R. Tranter, Henley-on-Thames, was 1st for Roses, and Mr. Such 2nd, both showing capital blooms. Mr. Walker, Thame, was a fine 1st in Dahlias, the blooms large and fresh. Mr. Walker was also 1st for Zinnias, a very fine exhibit, and Mr. Tranter for Asters. In the classes open to private growers, only Mr. B. Campbell was 1st for Roses, and Mr. Mott for Show Dahlias. The best Cactus kinds coming from Mr. Butler, gr. to Mrs. Pocock, Curtisfield. Mrs. King, Maidenhead, was easily 1st for table decorations, with a very tasteful exhibit, not overdone.

Miscellaneous Exhibits.—Of plants, the most important of these was that from Messrs. B. S. Williams & Son, of Upper Holloway. This consisted of some choice Orchids, Cattleya Dowiana being conspicuous; also of Sarracenias, select Crotons and Palms making in all a very pleasing exhibit. Messrs. J. Veitch & Sons Chelsea, sent a large and fine assortment of fruit (hardy kinds), the Plums and Apples being particularly good; with these were a splendid lot of Herbaceous Phloxes and Hardy Annuals and other hardy border flowers. Mr. Such had a large display of plants and also of hardy flowers, the latter being of unusual excellence. Mr. Phippen, Reading, had floral arrangements in his usual good style; and Mr. Owen, Maidenhead, a small and tasteful exhibit of small decorative plants. Mr. Will Taylor showed Roses in very fresh condition, and Messrs. Laing & Sons had a fine lot of cut Begonia blooms, &c. Mr. Charles Turner also exhibited Roses in his usual good style. These and other miscellaneous exhibits forming most important features in the show.

ROYAL SCOTTISH ARBORICULTURAL.

The ambitious scheme of the Council for a week's excursion in the far south had been most thoroughly endorsed by the Society, and nearly 150 Scottish arboriculturists assembled at the ancient White Hart Inn at Windsor, including Colonel Bailey, Lecturer on Forestry to the University of Edinburgh; Mr. Methven of Edinburgh, Mr. Watt of Carlisle, Mr. Dunn of Dalkeith, Mr. Rutherford of Kirkleatham, Mr. Michie of Balmoral, Mr. Lindsay of the Edinburgh Botanical Garden, and the indefatigable Secretary, Mr. Moffat, but unfortunately not the President, Professor Balfour, who was detained in Edinburgh by a course of lectures.

Though late to bed, the foresters were early to rise, and soon after eight on Tuesday morning were streaming through the royal stables and the state apartments of the Castle and up the round tower, where the "pride of the morning" still obscured the horizon. Under the guidance of Mr. Collmann, inspector of the palace, they then visited the north terrace and the formal gardens on the east side of the building, where a fine specimen of *Kolreuteria paniculata* and a *Panlownia*, some 2½ feet in diameter, attracted some attention. Strolling through the garden to Queen Adelaide's cottage, and noting by the way a fine *Fraxinus ornus*, the fine Beech, differing from the ordinary variety, and now 3½ feet in diameter, which was an offshoot taken from the Luther tree at Altenstein, and transplanted here in 1850, next attracted attention.

After a visit to Her Majesty's pet dogs, a short walk brought the party to the largest Oak in the Home Park, which proved 30 feet 5 inches in girth at 5 feet up. Herne's Oak blown down in 1863 is now represented by a sapling planted by Her Majesty in that year in the neighbourhood of several fine old trees of the same species from 800 to 1000 years old. The pedunculate and scarlet Oaks here suffered severely this year from the ravages of the Oak leaf-roller moth (*Tortrix viridiana*); but Mr. Simmonds, the deputy surveyor, who had prepared a guide-book for the party, and to whose personal guidance much of the success of the visit was due, stated his experience to be that the Durmast Oak (*Q. sessiliflora*), was not attacked, an experience which we found to be, to a modified extent, endorsed by Mr. Lascelles, Deputy Ranger of the New Forest, where the sessile-flowered Oak is more abundant. Mr. Simmonds also told us of his failure in an attempt to cope with the plague by putting, as suggested by Miss Ormerod, tarred hay-bands round the trees when the moths are crawling up them to deposit their eggs.

Approaching the Royal Mausoleum at Frogmore,

we were attracted by a fine deciduous Cypress, 8 feet at girth at 5 feet up, and 35 feet to its lowest branch; but several holes drilled by the green woodpecker probably indicated its unsound condition. On emerging on to the lawn of Frogmore House, another fine specimen of the same tree was noticed with branches feathering to the ground, together with grand specimens of Ginkgo biloba, Libocedrus decurrens, and Robinia, the latter 13 feet 3 in. in girth. There are several fine holm Oaks near the cottage which are believed to be about 400 years old, this species having, according to tradition, been introduced yet earlier by the Crusaders. One of these trees, beneath which Her Majesty often takes her breakfast, proved to be 16 feet 2 inches in girth.

After inspecting the aviary of poultry and pigeons, the coolness of the Prince Consort's model dairy, built in 1858, was, considering the heat of the day, most acceptable, and, after walking through the dairy farm, with its interesting variety of cattle, from the North American bison to the quieter and more beautiful Jersey cows, we noticed, on our way to the gardens a beautiful specimen of *Cedrus atlantica* var. *glauca*, planted in 1858, in very fine condition. The extensive vinerias and conservatories, bright with *Gloriosa superba*, and *Nepenthes* next occupied our attention, under the guidance of Mr. Owen Thomas and his foreman. We sampled the fine display of Peaches as we filed through the fruit-room, and then walked through a part of the 50 acres of kitchen garden. Considering that daily supplies have to be sent from here to the royal households at Osborne and Balmoral, cultivation is necessarily on a market-garden scale. The well-loaded espalier Pear trees, the Asparagus forcing beds with light frames and under-ground pipes, and the Strawberry plants, put out after having been once forced, were among the chief objects of interest.

A few minutes' walk brought us to the Prince Consort's Shaw Farm, where Her Majesty had graciously provided luncheon. Carriages were then taken for a drive through the Great Park, the first halt being at the Flemish Farm, for a glimpse at the Devon and Hereford cattle that the skill of Mr. Tait has rendered so famous in the show-yard. Passing the Prince Consort's Memorial Oak, attention was directed to the plantation of maiden Oaks in Cranbourne Chase, extending over 13 acres, planted under Lord Burleigh's direction in 1580, after the Armada had threatened the destruction of our naval forest of Dean. These fine trees were found to average from 15 to 15½ feet in girth. Dismounting at Cranbourne Tower, under the surveillance of a fine herd of white-red deer, we next examined the so-called William the Conqueror's Oak, supposed to be one thousand years old. Though now a mere wreck with but one live limb, it girthed 36 feet 9 inches, and twenty-three of our party were able to stand at once in its hollow interior. Remounting the vehicles the party then entered the forest, and passing the fine young Beech named after Queen Adelaide, reached the largest tree at Windsor, outside the park, an Oak girthing 35 ft. and in a far less decrepit state than the Conqueror's Oak which had just been seen. Re-entering the park, after traversing some interesting plantations of Oak and Beech dating from 1820, some more ancient pollard Oaks were seen near Forest Gate, some in very fair condition considering their eight centuries of age, and a Jubilee Oak of 1887, and then with much interest the Prince Consort's estate workshops were visited. The travelling saw-bench for heavy timber and the smaller bench, both worked alternatively by a turbine wheel or by a 14 horse-power engine, were seen at work, and their efficiency especially admired, some of the party recalling the economical engine seen by them some years ago in their excursion to Balmoral. Driving to Cumberland Lodge, the residence of the Ranger, H.R.H. Prince Christian, the royal Vine, believed to be the largest in the world, was visited. It is a cutting from that at Hampton Court, and at the time of this visit bore 1750 bunches. The carriages then crossed Smith's lawn, where the statue of the Prince Consort presented to the Queen by the women of Her empire is situated, and entered on the most beautiful portion of the drive, that skirting the shores of Virginia Water. We naturally regretted that we could not see the Rhododendrons in blossom; but alighting near the ruins brought from Tripoli in 1817 we thought, as we saw the self-sown Firs, Elders and Sycamores springing from the granite capitals and friezes, as two days later we thought at Beaulieu, that our landscape gardeners might well substitute ruined walls for many of the atrocities supposed to be

rockeries. Close to the ruins are some fine old Yews and Cedars. At Belvidere Fort a welcome cup of tea awaited the party, and here we loyally celebrated our visit by planting a young specimen tree of *Abies Albertiana*, brought specially from Edinburgh for the purpose. The most notable part of the return drive to Windsor was the Long Walk with its 2½ miles of avenue, formed by 1,652 Elms in two rows, 30 feet apart, planted in 1680. Part of this avenue is being gradually replaced by Oak; but the trees are at present hardly visible among the coniferous nurses.

The annual dinner of the society was held at the White Hart Hotel, Windsor, under the presidency of Mr. John Methven.

(To be continued.)

ENQUIRY.

"He that questioneth much shall learn much."—BACON.

AGE OF THE TULIP TREE.—Will some of our readers kindly inform "J. C." at what age the Tulip tree (*Liriodendron tulipa*) usually commences to blossom under the most favourable circumstances?

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees;—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.;
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 12, is furnished from the Meteorological Office:—

"The weather was almost continuously fine on our extreme southern and south-eastern coasts, but in all other parts of the kingdom it was less settled—showers falling rather frequently over England, a great deal of rain in the extreme western and northern districts. Sharp thunderstorms occurred at nearly all stations late on the 9th or early on the 10th; those experienced in the north of Ireland being exceptionally severe. During the latter part of the week the atmosphere was very close and oppressive.

"The temperature was above the mean in all districts, the excess ranging from 6° in the 'Midland Counties,' 'England, N.W.,' and 'Ireland, S.,' to 4° in most other parts of the kingdom. The highest of the maxima were recorded either on the 8th or 9th, when they ranged from 85° to 86° in most parts of 'England,' to 80° in 'Scotland, E.' and 'Ireland, N.,' and 78° in 'Ireland, S.' The lowest of the minima were registered during the early morning of the 6th, when the thermometer fell to between 35° and 37° in Scotland, to 39° in the Midland Counties, and to between 40° and 43° in most other districts. In the Channel Islands, however, the lowest reading was 50°, and in 'Ireland, S.,' 53°. During the greater part of the week the nightly minima were high; those recorded during the last few days being 60° and upwards.

"The rainfall exceeded the mean in 'England, E.,' 'Scotland, W.,' and both the Irish districts, and just equalled it in 'England, N.W.,' in all other districts there was a deficit. The rainfall experienced during the thunderstorms was very heavy in places, notably at some stations in the north of Ireland and England, and at Cambridge—the latter fall seems to have been very local.

"The bright sunshine exceeded the mean in nearly all districts, the percentage of the possible duration ranging from 23 to 28 in Scotland, from 31 to 33 in Ireland, and 35 to 36 over England. In the Channel Islands the percentage was as high as 72°."

STATE HONOURS.—The public recognition of the services of several men distinguished in science, art, and literature, brings into prominence the fact that exactly similar honours are conferred upon successful men of business, municipal dignitaries, and upon unsuccessful party politicians. We do not question the fact that some recognition is due to the latter classes, but it is absurd to put them on the same level with men who have achieved distinction on intellectual grounds. If discrimination is not to be exercised, it would be better to be without State honours.

SIR JOSEPH GILBERT.—We are glad to be able to announce that the Queen has conferred the honour of Knighthood on this distinguished chemist and experimentalist.

MARKETS.

COVENT GARDEN, August 17.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

MARKET heavily supplied with all classes of goods, prices being practically ruled by buyers. *James Webber, Wholesale Apple Market.*

POTATOS.

Arrivals are still very heavy and demand limited, except for finest samples, which realise 5s. 6d. to 6s. 6d. Ordinary samples hard to clear, except at very low prices. *J. B. Thomas.*

SEEDS.

LONDON: August 16.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that there is a strong demand for seeds for present use. French Trifolium remains unchanged, but English seed, both early and late, commands higher prices. For imported Italian Rye-grass, which is much dearer, there is a good enquiry. The trade for winter Tares, which show good quality, is good. Rye is good and cheap. Mustard is in strong demand, but very scarce and dear. Sowing Rape seed meets a steady inquiry. The trade for Canary seed during the past week has been meagre, prices unchanged. Hemp seed firm. Linseed neglected. Other articles show no quotable variation.

FRUITS AND VEGETABLES.

BOROUGH: August 15.—Quotations:—Cabbages, 3s. to 4s. per tally; Parsley, 1s. 6d.; Carrots, 2s. to 4s.; Turnips, 2s. 6d. to 4s. per dozen bunches; Onions, Egyptian, 5s. to 5s. 6d. per cwt.; Plums, 2s. to 3s. per half-sieve; Apples, 1s. 6d. to 3s. 6d. per bushel.

SPITALFIELDS: August 15.—Quotations:—Cabbages, 2s. to 4s. per tally; Turnips, 2s. 6d. to 4s.; Carrots, 2s. to 4s. per dozen bunches; Onions, Egyptian, 5s. to 5s. 6d. per cwt.; Plums, 2s. to 2s. 6d. per half-sieve; Apples, 1s. 6d. to 3s. 6d. per bushel.

FARRINGDON: Aug. 16.—Quotations:—Parsley, 1s. 6d.; Carrots, 2s. to 4s.; Turnips, 2s. 6d. to 4s. per dozen bunches; Cabbages, 3s. to 4s. per tally; pickling do., 2s. per dozen; Egyptian Onions, 5s. to 5s. 6d. per cwt.; Cucumbers, outdoor, 4d. to 6d. per dozen; do., frame, 1s. 9d. to 2s. 3d. do.; Marrows, 9d. to 1s. per dozen.

FARRINGDON: Aug. 17.—Quotations:—Apples, Manx Codlins, 2s. 6d. per bushel; Pears, William, 4s. to 5s. do.; Grapes, 5d. per pound; Tomatos, 2d. do.; Plums, 2s. to 2s. 6d. per 28 lb.; Nuts, Kent, 4d. per lb.; Melons, 6s. per case.

POTATOS.

BOROUGH: August 15.—Quotations are from 4s. 8d. to 7s. per cwt.

SPITALFIELDS: August 15.—Quotations are from 4s. 6d. to 7s. per cwt.

FARRINGDON: August 17.—Quotations:—Hebrons, white, 90s. to 110s.; do., red, 90s. to 95s.; Cole's Favourite, 90s. to 100s. per ton.

LONDON AVERAGES: August 16.—Hebrons, 90s. to 120s.; Magnums, 80s. to 100s.; Snowdrops, 95s. to 110s.; Regents, 75s. to 85s. per ton; other kinds, 4s. 6d. to 5s. 6d. per cwt.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending August 12, and for the corresponding period last year:—1893: Wheat, 26s. 3d.; Barley, 21s. 11d.; Oats, 20s. 6d. 1892: Wheat, 29s. 11d.; Barley, 22s. 9d.; Oats, 21s. 5d.

HAY.

Averages.—The following are the averages of prices at the principal metropolitan markets during the past week:—Clover, prime, 130s. to 167s.; new, do., 115s. to 130s.; inferior, do., 100s. to 120s.; hay, best, 145s. to 165s.; inferior, do., 90s. to 100s.; new, mixture, 115s. to 130s.; and straw, 80s. to 50s. per load.

AMYGDALUS NANA: *M. F.*—We are greatly obliged, and shall probably figure the specimen, which we have rarely if ever seen before.

APPLE MAGGOT OR CODLIN MOTH: *P. G.* Scrape off all the old bark in winter, burn the scrapings. Wash the scraped tree with petroleum emulsion. Paris Green is too dangerous for general use.

CATTELEYA ROOTS THICKENING: *W. W.* We may be in a better position to advise you if you send us a specimen of the roots affected.

DAHLIA: *M. A. S.* The union, Siamese-twin fashion, of two Dahlia stalks is not very uncommon. We thank you for your excellent sketch.

EXAMINATIONS AT THE ROYAL HORTICULTURAL SOCIETY: *Interested.* Your questions would have been better addressed to the Secretary of the Royal Horticultural Society. (1) The questions that were set were published in several, if not in all, the gardening journals. See *Gardeners' Chronicle*, March 18 last, p. 33. (2) The candidates got their instruction where and how they could. Some had advantages in this respect, others had none beyond their own energy and intelligence—the best of all advantages.

FRUIT TREES: *Richmond.* A heavy application of weak manure-water will certainly do good to the old Apple trees; more especially if they are bearing heavily. Being on turf, the latter should be stabbed with a digging-fork all over as far as the branches extend, and more as approach is made to the circumference, the best roots being thereabouts. If the soil is found to be very dry, a watering may be afforded with clean water first. Too much stimulus to growth at this season would result in late growth, which might not get matured. In the winter, two or three manual waterings should be afforded the trees.

INSECTS: *J. B., Marseilles.* The "Cattleya-fly," *Isosoma orchidearum*, a small Hymenopterous insect.—*Loadstone.* Your loam is infested with wireworms. The best thing would be to discard the soil and get fresh, but the worms can be killed with salt if well mixed with the soil, or by gas lime; or the turf could be baked before it is used.

LEAF: *J. O.* The shrivelling of the leaf arises, perhaps, from frost, or from excessive radiation.

MEALY-BUG: *J. R. H.* Mealy-bug is often troublesome, but we can hardly imagine it being allowed to "completely spoil two Orchid-houses and kill a Tacsonia." Bug upon Orchids may be eradicated by constant sponging with soft-soap and water, which for the more tender species will be quite strong enough to use; but upon others and the more robust kinds a weak solution of Fir-tree oil or other insecticide will be safe if used in no stronger solution than the directions issued therewith warrant. If there are other climbers in such bad condition as the Tacsonia was, they should be taken down and syringed with a solution of paraffin at the rate of a quarter of a pint to 4 gallons of water, with plenty of soap added. Keep the whole well mixed whilst the liquid is being used, and in the winter cut hard back to the old wood, and make a clean start. The plant you sent is *Nicotiana rustica*.

NAMES OF FRUITS: *A. B.* The Pear you sent was too far decayed to be recognisable.—*Y.* Your box was broken in the post, and so you can best imagine the condition of the Peaches.—Other correspondents must please to consult our next issue.

NAMES OF PLANTS: Many correspondents must wait till next week.—*A. M. D. I.* *Cymbidium giganteum*; 2, *Cypripedium Sedeni*; 3, *Oncidium Lanceanum*.—*T. S.* *Atriplex hortensis*, or Orache, the red variety. The leaves are used as Spinach.—*J. R. H.* *Nicotiana rustica*.—*E. R. I.* Siberian Crab; 2, *Nicandra physaloides*; 3, *Chenopodium polyspermum*; 4, *Epimedium* sp.; 5, *Campanula speculum*, Venus' Looking-glass.—*J. C. I.* Pent-

stemon gentianoides; 2, Solidago virga anrea; 3, Sidalcea candida; 4, Achillea Ptarmica, double; 5, Echinops Retro; 6, Gnaphalium sp.—*J. C. Gypsophila paniculata.*—*J. H. Polygonum Sachalinense.*—*W. R. C. Linaria vulgaris.*—*J. E. 1, Stenactis speciosa; 2, Chrysanthemum lacustre; 3, Veronica spicata; 4, Helianthus rigidus; 5, Hemerocallis fulva.*—*B. W. L. 1, Polygonum Fagopyrum (Buckwheat); 2, Saxifraga aizoides; 3, Arundo Phragmites (common Reed); 4, Erigeron canadense; 5, Oxalis corniculata; 6, Hieracium aurantiacum.*—*G. T.* It is impossible to speak with certainty, but we think it may be *Cypripedium pubescens.*—*B. & Sons. Stactis sennata.*—*Miss A. N. Melilotus officinalis*, a weed if you like, but a very handsome one, and a very useful one for forage. There used to be plenty of it on the railway banks near Forest Hill.—*G. H. S. 1, Cuphea platycentra; 2, Hedychium Gardnerianum; 3, Bomarea*, next week; 4, next week; 5, *Bignonia grandiflora; 6, Abelia floribunda; 7, Eryngium; 8, Euphorbia Lathyris caper spurge.*—*Herb. Helleborus viridis*, very poisonous.

PEACH LEAVES: *J. G.* The appearances are probably due to the sun shining on the leaves when sprinkled with dew drops or water from the hose.

RATING: *E. B.* In the Worthing Appeal Case it was decided by Mr. Justice Day, and approved by Mr. Justice Wills, that the houses there referred to were market gardens in the meaning of the Act, notwithstanding that they had walls and a roof. They were therefore only liable to be rated at one-fourth of the rateable value, but this does not refer to the poor-rate. For further particulars we would refer you to the Nursery and Seed Trade Association.

ROSE MARÉCHAL NIEL: *R. F.* Your Rose has certainly behaved very well; but, such persistent blooming will not tend to longevity. Seeing that you have to use your house for different purposes, the Rose will accommodate itself to continual forcing; but, the bud will come, though possibly not for a few years.

SWEDES: *G. H.* The swellings on the root are due to a slime fungus (*Plasmodiophora Brassicæ*). Do not grow the Turnips on the same land for several years. Burn all the affected plants.

TOMATOS: *Enquirer.* There is no disease in the leaves sent, and they are damping off from too much moisture and too little ventilation. A very common mistake. *M. C. C.—J. S.* Too common, the result of the growth of a fungus, *Cladosporium fulvum*, often figured and described in the *Gardeners' Chronicle*. Spray with Bordeaux Mixture early in the season. Burn the affected fruits.

WIREWORMS: *H. F. E.*—About 10 cwt. of gas lime would be sufficient for each acre. The ground must be clear of crops at the time of dressing, and for six weeks afterwards. Use fresh lime, and you can have nothing better.

COMMUNICATIONS RECEIVED.—Shropshire Horticultural Society.—*W. W.—A. E. S.—A. F. W.—Loadstone.—Riviera.*—*W. L. and C. Waters* should address the Publisher another time.—*Maidenhead Hort. Soc.—W. W.—A. & N.—Riviera.*—*W. M. D.—C. T. D.—J. J. W.—J. U.—E. B.—J. D.—F. V. D.*

LARGELY INCREASED CIRCULATION of the "GARDENERS' CHRONICLE."

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per cent.

Advertisers are also reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN, AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and is preserved for reference in all the principal Libraries.

ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schröder.

TO FLORISTS, &c.—Youth, age 19, wants a situation; three and a half years' first-class trade. Can Make up; accustomed to Marketing.—**C. H.**, 95, Shake-peare Road, Acton, W.

REAPING and SOWING are the two most important periods in the life of the farmer, and granting that all circumstances are favourable, he naturally, during the later period, hopes to get an adequate return for his labour. As he sows, he expects to reap, and unless constant industry has been exercised, the harvest is generally a poor one. So it is with regard to health, if we are not constantly on the watch and destroy the germs of disease as soon as they are discerned, the body becomes weakened, and at last is unable longer to resist the attacks of the enemy. Holloway's Pills destroy even the most minute traces of disease, by purifying the blood and strengthening the system.

"GARDENERS' CHRONICLE."

LARGELY INCREASED CIRCULATION.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of 75 per cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home and abroad, and is preserved for reference in all the principal Libraries.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

H. CANNELL AND SONS wish to inform all friends and customers that their ROMAN HYACINTHS and other BULBS have arrived in the finest condition and size. Our large quantity, and experience in importing direct from the most energetic growers, offer great advantages, and we should feel a real pleasure in receiving orders, knowing, as we do, they will be sure to give more than satisfaction throughout the season. Send for a Catalogue. Swanley, Kent.

Enfield Highway, N.

The Brimsdown Nurseries, adjoining Brimsdown Station, G. E. R. TWENTY-FIFTH ANNUAL TRADE SALE OF STOVE and GREENHOUSE PLANTS.

MESSRS. PROTHEROE AND MORRIS are instructed by Mr. John Maller, to SELL by AUCTION, on the Premises, the Brimsdown Nurseries, Green Street, Enfield Highway, N., on THURSDAY, September 14, at 11 o'clock punctually, there being upwards of 1300 lots to sell in one day. About

50,000 STOVE and GREENHOUSE PLANTS, remarkably well-grown, mostly in 48-pots, and fit for immediate sale, consisting of

20,000 WINTER-FLOWERING HEATHS, including Hymenals gracilis, Cavendishii, hybrida, &c.

2000 Tree and other Carnations, Duke of Eife, Duke of Clarence, Winter Cheer, &c.

1500 Tea Roses, in pots, The Prince, Niphetos, C. Mermel, Climbing Niphetos, Marechal Niel, Gloire de Dijon, Perle des Jardins, W. A. Richardson, &c.

1000 Ampelopsis Veitchii, Clematis Jackmannii, &c.

600 Epacris, to name. 500 Crotonas, beautifully coloured. 5000 Solanums, exceptionally well berried.

3000 Ferns, Adiantums, Polypodiums, Pteris, Lomarias, &c. 3000 Bouvardias, leading sorts. 5000 Gemsta fragrans. 1000 Palms, in variety. 10.0 Zonal Geraniums, new and leading varieties.

2000 Cyprus distans. 1000 Passifloras. 1000 Grevillea robusta.

Large quantities of Ficus, Aspidistras, Anthuriums, Poinsettias, Plumbagos, Callas, Aralias, Abutilons, New Hybrid Crasulads, Stove Climbers, Dipladenias of sorts, Bougainvilleas, Allamandas, Steptanotis, &c.

May be viewed any day prior to the sale. Catalogues may be had on the premises, and of the Auctioneers and Valuers, 67 & 68, Cheapside, London, E.C.

N.B.—The whole of the stock is in first-rate condition. The Ericas are specially well set for flower, and the Solanums unusually well-berried, and are undoubtedly the finest lot offered at this nursery for many years.

Lee Bridge Road Nurseries, Leyton, E.

GREAT ANNUAL TRADE SALE OF WINTER FLOWERING HEATHS and GREENHOUSE PLANTS, by order of Mr. J. Fraser.

MESSRS. PROTHEROE AND MORRIS respectfully give notice that the above ANNUAL SALE will take place on WEDNESDAY, September 13.

Longlands Park Nursery, Sidcup, Kent.

GREAT ANNUAL TRADE SALE, by order of Messrs. Gregory & Evans.

MESSRS. PROTHEROE AND MORRIS beg to announce that the above ANNUAL SALE will take place on FRIDAY, September 15.

WANTED TO RENT, a NURSERY, not less than 500 feet of Glass.

H. H. C. FULLER, High Street, North Finchley, N.

To Nurserymen, Florists, and Gentlemen Gardeners.

FOR SALE, a LARGE NURSERY, in the

North of London, covering over 3 Acres of Land, comprising 21 Greenhouses, ranging in length from 40 to 160 feet, seven of which are planted with Vines now bearing a splendid crop of Grapes; all heated with the best system of hot-water engineering. Some hundreds of casts of pots, from 60 to 15; splendid ranges of pits; size of lights, 6 feet by 4 feet, of which there are about 300. Water laid on so that a 60-foot hose will reach any part of the land. A fine Stock of Bedding and Decorative Plants, Ferns, &c. Stable and Coach-house; splendid Mark-T Van, nearly new, to carry 2 tons. A good substantial DWELLING-HOUSE, in thorough repair, with Bath-room and hot water throughout. Potting-shed, Tools, and all the necessary appliances appertaining to a first-class Nursery. The whole to be Sold as a going concern. For further information, apply to Mr. READ, Vine Nursery, Down's Road, Clapton.

TO BE SOLD, a NURSERY, containing Ten Houses, all heated and well-stocked, at a Ground-rent of £10 per annum.

W. J., Silver Hall Nursery, Isleworth.

FOR SALE, a SMALL NURSERY, 5 Green-houses, &c. Fitted by Hot Water. Stock and Trade, &c.—Apply, W. H., The Nursery, Park Row, Greenwich, S.E.

FREEHOLD VILLA for SALE, with four large Greenhouses and two Conservatories. New property. Close to three Railway Stations. Apply to Owner, Durant's Road, Pooders End, Middlesex.

LONDON, S.E.—FOR SALE, a compact NURSERY, FLORIST, and JOBBING BUSINESS, Five Greenhouses, and half an acre of Land. Rent, £10 per annum. Full particulars of H., Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

NURSERY and FLORIST BUSINESS for SALE, in one of the best Suburbs in the South of London, comprising 500-feet run of Houses, all well heated; and Pits. Lease, 90 years to run, at £15 10s. Ground-rent. Good business done in Plants and Jobbing. Price for the whole, £500.—CITO, Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

OLD-ESTABLISHED NURSERY BUSINESS for SALE, same hands over forty years. Nine Acres of Stock, several Greenhouses, good Dwelling-house. Capital required to include Stock, Horses, Carts, Lease, Goodwill, &c., about £3000. Exceptional opportunity for purchasing. A thoroughly genuine concern. Further particulars of Messrs. PROTHEROE AND MORRIS, Auctioneers, 67 and 68, Cheap-side, London, E.C.

TO LET, a SMALL NURSERY, with 6 Green-houses, all heated with Hot Water. Stock at valuation. Good connection of Jobbing Work. Low rents.—Apply, Shakespeare Nursery, Shakespeare Road, Herne Hill, S.E.

TO FLORISTS.—TO LET, large GARDEN, 3 Glasshouses, largest 87 by 18 feet. Stocked. Rent £8. Close to Market Town.—PATTISON, Bower Lane, Kilpia Hill, Dewsbury Road, Dewsbury.

Datchet, Bucks.

GARDEN GROUND to be LET, from Michaelmas next, about 2 1/2 Acres, walled in with Green-houses, Lights, Potting Sheds, Stable and Coach-house, Fruit-room, and small Yard.—Messrs. BUCKLAND AND SONS, Land Agents, 4, Bloomsbury Square, London, W.C.; and Windsor.

Important to Market Gardeners.

GARDENS to be LET WITHOUT RENT.—The Kitchen Gardens and Glass belonging to a Gentleman's Mansion, 11 miles from London, and one minute from station on the L. & N. W. R., to be Let without rent, in return for the Pleasure Grounds being kept in order. Can be seen at any time by appointment. Address, X. M., 41, Wellington Street, Strand, W.C.

City of Peterborough.

To NURSERYMEN, FLORISTS, SEEDSMEN, and OTHERS.

TO BE LET, with Immediate or Michaelmas Possession, the well-known, old-established Peterborough BUSINESS, comprising a NURSERY FARM of 25 acres, of which 13 acres are under cultivation, not heavily stocked; the remainder in Pasture Land, with good House and Premises, Greenhouse, Pits, &c., adjoining the Town. Also, a superior SEED SHED and STORE, in a first class central position; and a FLOWER-STAND on the Great Northern Railway Station. The whole Business has for many years been carried on by Mr. John House, who is retiring on account of declining health, and leaving a fine opportunity for an enterprising tradesman. Apply, FOX AND VERGETTE, Estate Agents, Peterborough.

SATURDAY, AUGUST 26, 1893.

INGLEBY MANOR.

LORD DE LISLE AND DUDLEY must indeed be considered a favourite of fortune, for in addition to historic Penshurst, with its associations of Sir Philip Sidney, he owns in Ingleby Manor an estate that can be traced back to Keltic times, for one or two of the hills near still bear Keltic-sounding names. Ingleby Manor is in the parish of Ingleby-Greenhow, near by the town of Stokesley in Cleveland. From old documents it appears that the parish was anciently called Ingleby-juxta-Greenhow, evidencing that Greenhow was the more important place of the two then. Now there are only a few scattered houses there; but, as our readers will see from what follows, it was important enough in its days of prosperity to have different owners to Ingleby and Battersby.

At the Conquest, Ingleby was attached to the Manor of Stokesley, which was held by a Norman Baron named Hanaud or Hanaart. In the twelfth century the Balliols were established at Stokesley, and leased Ingleby to Adam de Ingleby. He was such a devout adherent of the church, that he handed over Ingleby Church, and the Church of Kirby-in-Cleveland, to Whitby Abbey, in whose possession they remained till the dissolution.

In the thirteenth century, Ingleby and Battersby passed by marriage to the Eures, Ada, only daughter of Hugh de Balliol, marrying the third Baron Warkworth. In 1619, Sir David Foulis purchased the lands of Ingleby and Battersby. He was the third son of James Foulis, laird of Collingtoun, or Colinton, as it is now called, and was in such high favour with "King James the Sext," that he came in the king's train, and was created first knight and then baronet. He was cofferer or treasurer to Charles I. He seems to have early opposed the arbitrary measures of the king, for in 1633 for resisting the commission issued to compel gentlemen to compound for neglecting to receive the honour of knighthood, he was brought before the Star Chamber, deprived of his official positions, committed to the Fleet, and fined £5000. His son and heir was mulcted to the extent of £500, and likewise imprisoned.

Greenhow was not held by the Manor of Stokesley, but at an early date became the property of the Meynells. From the Meynells it passed to the D'Arcies. Thomas Lord Darcy was beheaded for taking part in the Pilgrimage of Grace. The estate was, of course, forfeited to the Crown. When Sir David Foulis purchased Ingleby and Battersby, James granted Greenhow at the same time, who thus became owner of the whole parish. So Ingleby-juxta-Greenhow became Ingleby-Greenhow. The succession of baronets continued to the present century. By the marriage of Mary, only daughter and sole-heiress of Sir William Foulis, the Ingleby estates became the property of Lord de L'Isle and Dudley.

A short walk from the station through the pretty Yorkshire village, leads to the church. The terrible effects of a recent severe lashing of hail were visible in the blackened drooping leaves of the Potatoes, and the clean holes cut in the Rhubarb leaves. The low Ivy-clad church of St. Andrew is very ancient. The architecture is early Norman, and some portions of the original church remain to the present day, including the chancel arch and the font. The carvings of the capitals of the Norman pillars are very grotesque, "comprising semi-human heads and busts, wild-beast and vegetable forms." Just opposite the church begins an avenue of sturdy old Elms, 200 years old, which leads to Ingleby Manor. It is fully a quarter of a mile long, and curves at the end. A stone pavement is laid the whole way on the left-hand side to the manor. It has evidently been laid down as a path to some abbey, for fragments of it are found in fields at some distance. The stones are quite worn in the middle by the tread of feet during so many centuries.

The first view of the manor gives the idea that it is an Elizabethan house. The original house was in the style of the present front, with a quadrangle in the centre. The additions to the old house erected in the previous century entirely altered its Elizabethan character, and made the house "respectable and commodious." It is the only part of the estate that does not savour of antiquity. It would appear that the entrance, to which the drive curves round a grass lawn with a clump of Rhododendrons in the middle, and then is continued round the corner of the house to a quadrangle, formed by the house, kitchen buildings, and stables, is the front one. It has been so till lately, but now the recently-erected porch entrance jutting out from the wall is used as the main entrance, more fitted for a church than a dwelling-house. The green sward had to be sacrificed, a broad gravel expanse had to be made, which ends suddenly at the hedge, for the carriages to turn round and drive past the old entrance.

The manor is built on a grassy plateau, now much reduced, which stands on the edge of a woody valley, with a trout-stream trickling at the bottom, now discovered, now hidden by the undergrowth. The opposite side is covered by a wood of massive wide-spreading trees, while the nearer side has an undergrowth of Rhododendrons and Foxgloves. On the east and south sides, the park comes close to the house. The park is open just near the house, owing to the trees being at considerable distances from one another, but they thicken in the distance. To the left is a clump of tall Oaks on a ridge. The flower-garden is between the house and the kitchen-garden, separated from it by an Ivy-clad wall. The garden is small, but very bright with old-fashioned flowers and the modern border Carnation.

The kitchen garden is not only useful but ornamental. The low wall that divides it from the flower-garden is covered with old-time Roses, like *centifolia rosea*, and the border on the valley side of the garden is planted with old Roses, chiefly York and Lancaster. The centre walk up to the sundial in the middle of the garden has by its sides a Yew hedge, about a foot high, into which are cut squares. On the other side of the dial, the path is lined with herbaceous borders; the bright colours of the flowers were seen to advantage, owing to the sunny day. Rose trees were frequent in the borders, and were producing some very shapely deep-coloured flowers. Mr. Harrison, the able

gardener, mentioned a number of varieties that succeeded best in the ironstone soil. Baronne de Maynard, Madame Louise Leveque, Fisher Holmes, Sénateur Vaisse, Annie Laxton, Maurice Bernardin, Countess of Oxford, Madame Victor Verdier, Etienne Levet, Lady Sheffield, Mabel Morrison, were sorts he mentioned particularly.

Mr. Harrison is also an adept at vegetable growing. Heavy crops of all kinds of culinary vegetable occupied the available space. The spring-sown Onions were a green mass, without a break. In addition to Mona's Pride, and the Ashleaf, Mr. Harrison has discovered an early Potato, White Beauty, which is ready for use nine weeks after planting, and is a tremendous cropper. Bush fruits were loaded with fruit, especially the Black Currants; and there was a good crop of Apples on the young trees.

In conclusion, I must express the great debt I owe to Rev. John Howell, Vicar of Ingleby, who has kindly placed at my disposal the result of his enquiries in the past history of his parish, and which has evidently been a labour of love. *Vagabond*.

NEW OR NOTEWORTHY PLANTS.

SACCOLABIUM MOOREANUM, Rolfe.

A SPECIES introduced with *Dendrobium Phalaenopsis* by Messrs. F. Sander & Co., of St. Albans, which flowered with Mr. F. W. Moore at Glasnevin, and shortly afterwards in the collections of Sir Trevor Lawrence, Burford, Dorking, and C. J. Lucas, Esq., Warnham Court, Horsham. It is allied to *S. Mimus*, Rchb. f., and bears dense racemes of small rose-coloured flowers tipped with green. *Kew Bulletin*, 1893, p. 64.

ANGRÆCUM BISTORTUM, Rolfe.

A West African species, collected in the interior of Lagos by H.E. Sir Alfred Moloney, K.C.M.G., which flowered at Kew in January, 1892. It is allied to *A. arcuatum*, Lindl., but has smaller flowers, whose spur is curiously curved into a loop, and its tip remains tightly clasped by the sheathing bract. *Kew Bulletin*, 1893, p. 65.

PLEUROTHALLIS PUBERULA, Rolfe.

A species of unknown origin, which flowered with Mr. F. W. Moore, of Glasnevin, in January last. It bears long racemes of small pubescent green Hawthorn-scented flowers. It is allied to *P. univaginata*, Lindl., of the section *Spathaceæ*. *Kew Bulletin*, 1893, p. 163.

BULBOPHYLLUM SPATHACEUM, Rolfe.

Introduced from the Shan States, Burma, by Messrs. Hugh Low & Co., of Clapton, and flowered with Mr. J. O'Brien, of Harrow-on-the-Hill, in July, 1892. It is allied to *B. apodum*, Hook. f., and has a dense erect raceme of light yellow flowers with a darker lip. *Kew Bulletin*, 1893, p. 170.

BULBOPHYLLUM VIRIDE, Rolfe.

A small species from West Africa, sent to Kew by Philip Crowley, Esq., Waddon House, Croydon, in December, 1890. It is near *B. intertextum*, Lindl., and bears slender racemes of light green flowers with a pair of small eye-like spots at the base of the lip. *Kew Bulletin*, 1893, p. 170.

ERIA ALDIFLORA, Rolfe.

A small Nilghiri species which flowered both with Mr. J. O'Brien, of Harrow-on-the-Hill, and at Kew. It is allied to *E. articulata*, Lindl., of the section *Bryobium*, and bears a lax raceme of small white flowers. *Kew Bulletin*, 1893, p. 170.

CULOZYNE TENUIS, Rolfe.

A species belonging to the small section *Flexuosæ*, which was introduced from Borneo by Messrs. Linden, L'Horticulture Internationale, Brussels, and

flowered in their establishment in August, 1892. It has light buff-coloured flowers. *Kew Bulletin*, 1893, p. 171.

EPIDENDRUM PUMILUM, Rolfe.

A pretty little Costa Rican species, introduced by Messrs. F. Sander & Co., of St. Albans, and flowered in their establishment in January, 1890. It approaches *E. Eadresii*, Rchb. f., in habit, but has light greenish-yellow flowers, with an orange-yellow crest on the lip. *Kew Bulletin*, 1893, p. 171.

POLYSTACHYA IMBRICATA, Rolfe.

An East African species, from the Zambesi district, which flowered with Mr. J. O'Brien, of Harrow-on-the-Hill, in August, 1891. It has light yellow flowers, with a pink pubescent lip, and is allied to *P. ensifolia*, Lindl. *Kew Bulletin*, p. 172.

ONCIDIUM LUTEUM, Rolfe.

A species of unknown origin, which flowered in the collection of Sir Trevor Lawrence, of Burford, Dorking, in June, 1892. It is allied to *O. chrysopyramis*, Rchb. f., of the section *Rostrata*, and bears a lax panicle of light yellow flowers. *Kew Bulletin*, 1893, p. 172.

LUSIA AMESIANA, Rolfe.

This is the species figured in our columns on July 8 last, p. 32, fig. 8. It is a native of the Southern Shan States, and was imported with *Vanda Kimballiana*, Rchb. f., by Messrs. Hugh Low & Co., of Clapton, with whom it flowered in June, 1891. It has also appeared with Messrs. F. Sander & Co., of St. Albans. *Kew Bulletin*, 1893, p. 172.

HABENARIA CINNABARINA, Rolfe.

A distinct little *Habenaria*, introduced from Madagascar together with *Disa incarnata*, Lindl., and *Cynorchis grandiflora*, Ridl., by Messrs. W. L. Lewis & Co., of Southgate. It has cinnabar-orange flowers, with a few red spots on the back of the sepals, and thus resemble those of the *Disa* just named in colour. *Kew Bulletin*, 1893, p. 173.

THE RESULTS OF PINCHING AND PRUNING.

WE take the following extracts from a paper contributed by M. Fernand Lequet fils to the *Revue Horticole* for August 1. We have omitted his physiological theories, which are open to question, but his practical deductions are interesting in relation to the discussion going on in our columns. Speaking of pruning, the author says: "This operation is termed (according to the season, during the time of growth at which it is performed), summer-pruning, and during the resting time winter-pruning. When a plant grows spontaneously and freely in the open air, there is no need to subject it to pruning, as the roots and branches grow in due proportions one to another. But under natural conditions, flowering does not occur until after a certain time, and not always regularly, nor at any fixed season.

"We will instance as examples unpruned Apple trees, which do not bloom until they are eight or ten years old, and only bloom well once in two years. As another illustration, we may mention soft-wooded plants, which, if not pinched, cannot be made to flower at any particular season that may be desired. Pruning has for special object the forwarding, retarding, and regulating of the time of blooming. Only it is of primary importance to know how each species develops its branches and its flower-buds, if these latter occur on the new or on last year's wood, and especially if, after the removal of the branch, the stock has the power of elongating and bearing flower in its season. The final object of pruning is to cause the premature development of certain branches, to hasten the development of the tree. Such is the theory, and in practice it is borne out in a most satisfactory manner.

"Referring now only to pinching. This operation should always be effected by nipping off the tip of the shoot between the nails of the thumb and index finger. This is why only the present year's branches

are pinched. Consequently, annuals or biennials are never pruned except with the fingers, while hardy woody plants can be pinched or cut, according as their soft or hard parts are treated. It must not be thought that the operation can be better done by cutting with a knife than by pinching with the nail, as this is not the case.

"With Melons, the male blooms are formed on the branches of the first and second generation, and it is on those of a more advanced generation that the female flowers appear. The pinching of the herbaceous parts having been accomplished early has resulted in the development of the branches of the third generation sooner than if the plant had been left to itself. In growing Melons, pruning or rather pinching (the word matters little), is considered essential to success. Fecundation is thus no longer a matter of chance. It is the same with Cucumbers. Consequent upon pinching, the roots become shorter and thicker, and grow closer together, forming a better ball. To the multiplication of branches there ensues a corresponding development of the underground parts.

"In the orchard the practice of pinching has the same effects as in the kitchen garden. Pears grafted on the free stock which give leaves without flowers, are much improved by long pruning in winter, and short pinching in summer. All the branches which are left unpinched on a Cherry tree, are so many fruit-bearing branches; this fact has become an aphorism since the careful experiments of the late M. Hardy. There ensues an immediate swelling of buds which become converted into flower-buds in the same year.

"In the Apricot, the pinched part flowers and fruits in the same or in the succeeding year. Repeated pinchings on the Peach gave identical results. This satisfactory plan was also inaugurated by M. Hardy. In the south the Lemon on espaliers, and subjected to pinching, becomes covered with buds. M. A. Constant, who recommended this method, has often counted on one flowering spray clusters of twenty-five to thirty flowers, or even more. By treating Oranges thus, we also achieved great success. A Pomegranate was induced to flower abundantly by pinching the tips of the new shoots in spring when they had attained a certain length. Repeated pinchings increase to a remarkable degree the fertility of Fig trees in pots, all the checked branches bore some, and several of them many fruits in the axils of their leaves in a manner unusual when these plants are left to themselves. Pinching the Vine-tendrils from the end of May to June 10 has often served to produce Grapes, and we have proved this again this year. Short (severe) or long (moderate) pinching allows light to be diffused freely among all the branches; this process hastens also the fertility of the trees, and tends to produce finer and better-flavoured fruit.

"Pinching may be recommended almost fearlessly to the florist, either in his houses or in the garden. See what horticulturists do who cultivate soft-wooded plants. They are always busy pinching their Petunias, Heliotropes, Verbenas, Cupheas, Anthemis, Pelargoniums, Calceolarias, Salvias, Malvas, Rubus rosæiflorus, &c., and thus they obtain dwarf spreading plants of good habit flowering abundantly. They do not at all hesitate to use this process for tuberous Begonias, as by its use they induce a less straggling habit, and if the flowers are rather smaller, they are of better substance, more lasting, brighter in colouring, and the blossoming is more uninterrupted. But novices can scarcely make up their minds thus to cut these plants. They remain incredulous of what they have not themselves seen.

"By means of pinching, the time of flowering is altered, that is to say, the blooming is retarded on plants on which it naturally would occur much earlier; witness the Bouvardia, Stevia, Ageratum, Coronillas, and Genista floribunda, the blooming of which occurs in the beginning of summer, and which is profitably deferred until winter. Thus there is the enjoyment of a first and second season. For all these species pinching is an indispensable adjunct to

the spring-pruning. And, as all delay in Nature is not necessarily so much time lost, but a period of latent labour, the flowers, which are not obtained at once, are accumulating at compound interest. If Azaleas, Camellias, and Rhododendrons can, without loss of bloom, be thus treated, it will be easy to arrange the time of flowering without having recourse, as do the Belgians now, to the inconvenient plan of keeping the plants in ice-houses. On the contrary, plants which do not submit to pruning, either because they do not push well afterwards, or because the wood dies back, as in the case of Pleroma, Centradenia, and Rogiera, accommodate themselves well to pinching.

"Applied to New Holland plants, moderate pinching induces the development of axillary buds, and the plants grow into a rounded form, covered with flowers, thus combining beauty of detail with beauty of general effect. We may mention Corraea, Pimelia, Pultenaea, Lechenaultia, Boronia, Brachysema, Templetonia, Tremandra, Lithospermum, Prostanthera, &c. Whilst we cannot by pinching secure a globular-shape, we at least avoid lanky, drawn, and hideously-trained examples. How many good plants are spoiled by neglect by being left untended for some time. It is true that pinching is not altogether compatible with rapid cultivation. We will speak of that now. It is thus, not to cite always the same examples, that fine specimens of Libonia and Erica are trained, that Ligustrum Quihoui pinched, flowers twice in one season, and that Ligustrum sinense or Hoteia pinched, does not flower again in the year. Similarly Bengal Roses, if pinched, flower twice in the season, while Provins Roses pinched do not flower at all. In the garden similar results follow pinching. In April and May dwarf your Phlox, Aster, Pentstemon, Phygellus, Antirrhinums, Dahlias, and Dielytras, and the clumps will become dwarf, bushy, and very free-flowering. Chrysanthemums will even stand successive pinchings later on until the month of July, a time when the shoots can still form buds before the frosts come. In those Roses which, like Gloire de Dijon, develop long scrambling branches by the side of their stronger boughs, when the blossoming at the ends of the shoots is over, take away the terminal bud, and the best nourished branches will bear flowers. From this point of view it may be remarked that with florists who deal in cut flowers, the plants flower for a longer time or more continuously than amongst other nurserymen. This second flowering depends upon the fact that the ordinary grower who sells his plant only allows the inflorescence to wither and dry up, and that the florists who cut the flowers before these are fully expanded, economise the strength of their plants which produce a second crop on the old stems (Boutons d'argent), or on the root (Veronicas, Larkspurs). The plants are in this case like good milk cows, whose milk increases under the treatment to which they are subjected.

"Magnolias and Japanese Medlars, which do not bear pruning, bear somewhat sooner under the influence of pinching, as do also Epacris, Alonsoa, Chenostoma, Solanum, Iochroma, Mitrasia, Diplacus, Euphorbia Jacquinæiflora, Poinsettia pulcherrima, Siphocampylus, Rondeletia, Heterocentron, Oxacanthus, Siphocampylus, and the gray Plumbago capensis. Further, careful pinching will never be regretted when all the young shoots are tipped with flower, and especially when the plants are arranged in a house at the approach of winter. At the same time, for certain shrubs, such as the Myoporum, which bears leafy pendent clusters studded with myriads of white florets, pinching, if done too late, robs the plants of their special charm. The same remark applies to the Eschynanthus, which like to wave their curious and beautiful flower-branches freely. Neither should such species be pinched as flower at the points, that is to say on one shoot springing from the root, as do notably Cinerarias, herbaceous Calceolarias, and Amaranths (Cockscombs), and whose habit is to form a single large and even cluster. But the difficulty is averted by frequently transplanting and re-potting. Also we must never reason by analogy, but ascertain facts by experiment; one species may

bear pinching well, and its kindred neighbour may give only miserable results.

"Finally, it would be easier to enumerate the species for which pinching is unsuitable, than the many for which it is admirably adapted. Besides causing multiplication of flowers on the branches, it consolidates these latter, renders them more independent, and also enhances their beauty by giving them strength and power, thus improving their habit.

"It seems further as if pinching had a monopoly of developing the beauties of plants, since we have sufficiently shown that without its assistance the blooming is poor. Again, without repeated pinchings Hibiscus Cooperi with variegated leaves, the variegated Fuchsia Darwin, Phyllanthus nivosus, variegated zonal Pelargoniums (Mrs. Pollock, Freak of Nature, &c.), and many others would not produce for our admiration their young shoots which are almost covered with flowers. In fact, so great are the improvements consequent upon this method, that to use a paradoxical expression to pinch is to increase by diminishing."

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM LEEANUM VAR. GIGANTEUM.

A HYBRID raised from *C. Spicerianum* by pollen of *C. insigne*. Considered to be the best of all the hybrid *Cypripediums* yet raised, taking into consideration its freedom of growth, time of flowering (early winter), and lasting qualities. *Reichenbachia*, t. 57.

CULOGYNE PANDURATA.

A noble Bornean species, with large flowers, 4 in. in diameter, of a green colour, but with the lip streaked and spotted with black. *Reichenbachia*, t. 58.

SCHOMBURGKIA SANDERIANA.

This handsome species is described by its author, Mr. Rolfe, as allied to *S. Humboldtii*, but has smaller flowers, with more prominent keels on the lip. The flowers are rosy-carmine. *Reichenbachia*, t. 59.

ONCIDIUM SUPERBIENS.

A species which thrives in a cool-house, a north lean-to being in all respects preferable. It is a species with loose scrambling racemes and large flat flowers, the prevailing colour of which is brown. *Reichenbachia*, t. 60.

DENDROBIUM JOHNSONIE.

A little-known species from New Guinea, sometimes known as *D. Macfarlanei*, and also as *D. niveum*, Rolfe, but the name here adopted, proposed by Baron Sir Ferd. von Mueller, has the priority. The flowers are pure white, with some slight purple stains on the side-lobes of the lip, but these are not constant. *Reichenbachia*, t. 61.

LÆLIO-CATTLEYA HYBRIDA BEHRENSIANA.

A cross between *Lælia elegans* Schilleriana and *Cattleya Loddigesii*, raised in Meers. Sander & Co.'s establishment. It is stated to flower twice annually. *Reichenbachia*, t. 62.

CALANQUES, HYBRID VARIETIES.

1, *C. Victoria*, has rose-coloured flowers; 2, *C. bella*, is the offspring of *Calanthe vestita* Turneri, crossed with *C. Veitchii*; 3, *C. burfordiensis*, is the result of a cross between *C. rosea* or *C. Veitchii*, and *C. vestita* rubro-oculata. *Reichenbachia*, t. 63.

CATTLEYA MENDELI QUORNDON-HOUSE VARIETY.

A superb white form of *C. labiata*, bought for a few shillings as an unproved plant, but which was sold at the Quorndon-house sale for 220 guineas. *Reichenbachia*, t. 64.

NOTES FROM KEW.

BAMBOOS AT KEW.—Visitors who care for Bamboos should not overlook the garden of them near the Rhododendron Dell. This garden has been formed in a sheltered spot, and the collection has

succeeded remarkably well, showing that the Bamboos of hardier kinds may be planted without fear in the open. There are splendid masses of *Bambusa Metake*, the hardiest of the family, and very fine with its rich green broad leafage. *B. Fortunei* is succeeding well; it has deep green leaves, and dense, spreading growth. There are varieties of it: one named *aurea* has rich yellowish foliage, striped with green, an attractive and effective kind. A very good form is named *variegata*, the leaves being narrower than in the species, and boldly striped with creamy white on a green ground, whilst it has also a dense habit of growth. *B. gracilis*, *B. castillonis*, *B. aurea*, *B. plicata* and *B. viridi-glaucescens*, a very graceful and beautiful kind, are well worthy of note. *Arundinaria Simoni*, a Japanese kind, is represented by immense masses, the taller shoots rising fully twenty feet in height. The beautiful *Phyllostachys violacea*, *P. nigra*, and *P. Quilloi* are in vigorous health, whilst there is a noble clump of *P. bambusoides*. The dwarf Bamboos are of much interest, and the large clumps of them in this garden show that they are hardy, and very handsome. One of the best is *Bambusa tessellata*, which is synonymous with *B. Ragamowski*; the leaves are very broad, long, and rich green in colour, with a yellowish longitudinal stripe nearly the whole way down the centre—it is very dwarf and vigorous. *B. nana* and *B. pygmaea* are both very dwarf, the latter of exceptionally dense growth. *B. Veitchi* makes a fine spreading mass, and it is one of the best dwarf Bamboos; the growth is compact, and the leaves broad, whilst they are of a pale green colour.

LILIUM HENRYI.

This beautiful Lily is flowering exceptionally well at Kew. It is one of the finest introductions of recent years, and it is not inapt to call it the yellow-flowered *L. speciosum*. There is great similarity between the two kinds. *L. Henryi*, which is named after its discoverer, Dr. Henry, is a native of Western China, and first bloomed at Kew in 1890. This year the stems have reached quite eight feet in height, and the flowers are produced freely. They are orange yellow, spotted with a reddish colour, and are effective. A bed of it may be seen at the back of the Orchid-house, and it is certainly a Lily that should be in every garden, for it is vigorous, not difficult to grow, very free, and bears flowers of distinct and attractive colour. *V.*

NURSERY NOTES.

MESSRS. T. F. RIVERS AND SON,
SAWBRIDGEWORTH.

Fruit Trees in Pots.—This nursery differs from most in the fact that fruit is grown in the orchard-house. Occasionally some of this finds its way to the exhibitions, but the best place to see it is in its own home. The system of growing fruit for dessert purposes is very suitable for those who have only a small amount of glass, and for amateurs who have plenty of time at their disposal, as a great variety of fruit can be grown in a small house. Cherries, Plums, Pears, Figs, Peaches, and Nectarines may all be accommodated under one roof, and if space permits, the season of each fruit may be prolonged several weeks by choosing suitable varieties; but it has its disadvantages also, one of which is, that such constant attention is required with the water-pot. When, during the summer, the trees are in full growth, they must be examined every two hours, for if once they are allowed to flag, it is impossible to bring the crop to a state of perfection, and most likely some of it will drop off. I very much doubt if this system would pay the market grower so well as if the trees were planted out and trained to trellises in the usual way, although one point must be mentioned in its favour—the houses can easily be emptied after the crop is gathered by placing the trees outside (which is much better for them), and the space can be utilised for other crops until the following spring; on the other

hand, the trees will require renewing oftener than permanent trees do.

Another important matter connected with fruit trees in pots is, that they have only a very limited space in which to search for food, liberal supplies must therefore be given during the growing season. Mr. Rivers makes no secret of this, and in his book, *The Orchard House*, full particulars are given of the mixture he uses as a top-dressing, which consists of equal quantities of horse-droppings and kiln-dust from the malt-bonae saturated with liquid manure, and turned over a time or two before using, so as to thoroughly incorporate the ingredients. It should be used the next day after mixing, if possible, or it will heat, and a portion of the ammonia will be lost. It is put on as a top-dressing, by placing small pieces of slate round the rim of the pot inside, and leaving just enough room for the water. The greater portion of the manurial properties gets washed down to the roots, and the remainder quickly becomes full of young rootlets, but it is a very strong manure, requiring to be used with great caution, if the liquid manure it is moistened with is of any value; and for greater safety, it would be advisable for beginners to dilute the liquid with water before mixing, and to add some dry loam before turning the heap. In the hands of experienced men it does wonders, but with others it kills the plants. If for any reason this mixture cannot be got, I have found Thomson's Vine Manure very effectual, and easy of application. I have dealt rather fully with this subject of manuring, because much of the success which Messrs. Rivers have in growing such fine fruits on pot-trees is to be attributed to its use, to the unceasing and skilful attention the strong healthy trees receive.

The earliest batch of Peaches and Nectarines started with fire-heat were almost over; a very fine yellow-fleshed seedling Peach alone remained. Strictly speaking, this is a late variety, similar in colour to *Salwey*, but distinct from it in shape and flavour; the other varieties had been gathered, and the trees plunged outside ready for sale, or for another season's cropping, and a promising lot of young Vines occupied the house. Among them I noticed some half-dozen in fruit, trained to a flat surface by arching two sticks over at the top, and training the Vine up one side, and down the other. These would make fine side-board decorations for a large dining-room.

Another house near this had some large Pears coming on, including *Lonise Bonne* of Jersey, *Doyenné du Comice*, *Conference*, *Pitmaston Duchess*, *Souvenir du Congrès*, *Parrot*, &c. I have found most Pears are better-flavoured if they are placed outside a few weeks before they get ripe, but growing them under glass increases their size immensely, and adds much to their appearance. Some nice trees of Plums in pots were growing in this house, the variety being *Late Transparent Gage*, a fine rich Plum for dessert.

In a house near this one were some pot Vines in fruit, one of which was *Black Prince* in a 13 inch pot, and the roots allowed to run into a bed of compost under the pot. This Vine was carrying seven very fine bunches, which would average 2 lb. each, and were coloured to perfection. We next entered a range of two long lean-to vineries, containing an enormous crop of Grapes, some of the bunches very large, and the berries swelling up well, with every prospect of a good finish, although I considered the crop on many of the Vines to be extraordinary. These Vines, however, have practically an unlimited root-run outside in a well-drained soil, and a fair sized border inside, where they are liberally fed with soot-water, &c. A new variety to me was growing here under the name of *Prunella*, and looked promising. The berries were after the style of *Madresfield Court*, but smaller in the bunch. Another variety seldom met with, called *Saint Antony*, was growing here. It is a reddish Grape when ripe, and has a peculiar shiny appearance, as if it had been rubbed, and for this cause many would object to it. Among other varieties doing well I noted *Gros Maroc*, *Gros Colmar*, *Mrs. Pince*, *Black Hamburgh*, *Lady Downes*, *Golden Queen*, *Alicante*, and *Madrea-*

field Court. The somewhat shy-bearing Duke of Buccleuch had made two grand young rods, but was not carrying a heavy crop.

My guide next took me into the later Peach-houses, where some fine young trees were swelling-off good crops, *Early Rivers' Nectarine* being especially noticeable for its earliness and good colour, one tree in an 11-inch pot was carrying twenty-six fruits, all of which were first-rate specimens, and fit for exhibition. Lord Napier was growing in the same house, but was more than a fortnight behind the other. *Dryden* and *Stanwick Elrugs* were also looking well, and were earlier than many other kinds, all of which looked well, and were carrying good crops. I was much interested in seeing the original tree of Lord Napier still in good health, and bearing well as a pot tree. Among the Peaches, *Early Rivers* was ripe, also *Hale's Early*, and *Rivers' Early York*, *Crimson Galande*, and many others were swelling-off good crops. A large number of later varieties were in these houses, and the collection will be well worth a visit in the autumn. In the Cherry-house, which is a low, cool, airy, span-roofed structure, I found the early varieties were over. Among the later kinds I noticed *Emperor Francis*, *Bedford Prolific*, *Bigarreau Napoleon*, *Late Black Bigarreau*, *Monstrueuse de Mezel*, *Bigarreau Noir de Guben*, *Géant de Hedelfinger*, and *Guigne de Winkler*, the latter variety had not reached half its size, and is not ripe until September, thus prolonging the season a great length; it is worthy of cultivation for that reason alone, as Cherries are always acceptable. The above, and several others were all growing in pots, sunk in the floor to keep their roots cool, and were carrying heavy crops of fine fruit.

Near this house I noticed some large fruits of Apples and Pears in variety on pot trees. These had been brought forward in the houses, and then plunged outside to make room for other things.

In the open quarters a fine lot of young trees were coming on. Fresh ground is taken in from the farm every year and planted up, so as to give the young stock the best chance. The older part of the nursery is being gradually converted into a fruit farm, and on the day of my visit (July 12), Plum gathering had commenced with *Rivers' Early Prolific*, of which kind I was informed over 100 tons were sent to the various markets last year. This season also the crop of this kind is very heavy, but owing to the prolonged drought the fruit is small. *W. H. Divers, Ketton Hall Gardens, Stamford, July 12.*

PLANT NOTES.

HABLITZIA TAMNOIDES.

ONE seldom sees a note upon this interesting climber. It makes a pleasant feature in the summer months, when covered with its multitude of small greenish flowers. It is quite hardy, and the best way to plant it is against an old tree stump, which it will mount up to a height of over 10 feet, and then the shoots hang down in graceful profusion, the greenish flowers, through their great abundance, having a charming effect. The growth is vigorous, and the plant continues in bloom for several weeks. There is such a repetition of climbing plants in gardens, that it is worth while to make a note of this *Hablitzia*. Provide at the commencement a well-drained soil, and bear in mind the importance of dryness at the root during the winter, but not in the summer. A mass of it, tumbling over the rougher parts of the rockery or rootery, is very pleasing. Its flowers, if not showy, are quaint. *V.*

PRESTON HALL.

BEING in the vicinity of Maidstone a week or two ago, we took the opportunity of visiting this fine residence, which until about two years ago was the seat of the late H. A. Brassey, Esq., father of the present owner. At that time it was feared that the place would largely share the misfortune that the family then sustained in the death of Mr. Brassey, but although there was a sale

of most of the plants in the green-houses, and indeed, of many other things beside, also attended with a considerable reduction in the working staff of the establishment, we were pleased to find that the general appearance of the grounds and of the houses was considerably better than might have been expected, and there are signs that before very long the place will be as well manned as formerly. The present gardener, Mr. W. Jarman, has had charge for the last eighteen months, and he is to be congratulated upon the condition the whole place

flower garden in the front of the Hall is rather small, and has been purposely placed so that the beds are hidden from the view of the lower windows. A pleasing fountain adds much to the appearance of this flower parterre.

The pleasure-grounds have been well laid out, and present new and pleasing features at every turn. Passing through what used to be a stove, but which now serves the purpose of a show or flower-house, some very finely grown tuberous Begonias of a capital strain attracted attention, as did also

these are generally of the best quality. One of the cool orchard-houses contained a crop of fair Peaches and some excellent Plums; also Lord Napier Nectarines, large and well-coloured.

Peaches are plentiful in other houses, and are bearing first-rate crops. A range about 150 feet long in five divisions, contained many varieties, especially good were Royal George, Noblesse, and Condor. The most interesting plants to be seen in a large number of houses, devoted to plants and fruits, were a very good batch of Crotons, some wonderfully large

FIG. 43.—VIEW OF PRESTON HALL, MAIDSTONE: GARDEN FRONT.

presents, considering the circumstances under which he has worked.

In the *Gardeners' Chronicle* for October 11, 1884, a detailed description of the establishment was given, together with a photograph, which we now reproduce (fig. 43), showing the garden-front of the house. As there stated, the specimens of Sweet Chestnut, Elm, and Cedar are amongst the finest in this country. The view from the north side of the house across an extensive park, where the deer are gracefully walking, or playfully gambolling in all directions, and beyond, where the curious little village of Aylesford discloses its prettiest features, and where the church stands out in very distinct manner from the background of hills behind it, is one of the most lovely in this pretty county. The

some good plants of *Hydrangea paniculata*. Close to this house is a little Fernery, which has certainly been made the most of, and where the plants, many of which are planted out, appear to be doing very well. There are seven vineries, and they are tolerably good ones, but the Vines are weak and old, and require renewal in each of the houses, and doubtless before long Mr. Jarman—a very successful Vine-grower—will have succeeded in his desire to introduce young canes.

The principal Fig-house is covered by one tree alone, which has been planted against the wall at the back of a lean-to house, and from there is trained down the roof to the front of the house. It is a very large specimen of Brown Turkey, and has often given a crop of over fifty dozens of fruits, and

plants of *Adiantum cucuatum*, and a commendable crop of Melons, each plant bearing about four fruits of medium size.

Outside, on the walls, the crops of Peaches and Nectarines were very good, and the Apples, Pears, Figs, Plums, Cherries, &c., on bushes, and on espaliers were—as is general this season—abundant, though perhaps a little smaller than they should be. The herbaceous borders are well arranged and carefully attended to, and at the time these notes were taken presented an exceptionally bright and interesting picture. There is a very fine rosery in the pleasure-grounds, where the bowers of Roses bore the appearance of luxuriant health, but many waterings and much assistance had been required to preserve them in such condition through so trying a

season as we have experienced this summer. One of the largest and most healthy specimens of Golden Yews to be seen anywhere is close by one of the walks; it is not a perfect pyramid, but it is of excellent colour, and cannot but excite admiration. The above are but a few notes taken during a hurried visit, and for further description of this large and beautiful place we must refer our readers to the issue of the *Gardeners' Chronicle* referred to above.

FLORISTS' FLOWERS.

THE PENTSTEMON.

As a garden-flower the Pentstemon is well known, and at this season of the year it forms a prominent and beautiful object. There is a very rich variety of colour in the flowers, but from the florist's point of view there is still much room for improvement in the size and form of the flowers. The figure of *P. Hartwegi* (gentianoides) in the *Botanical Magazine*, t. 3661, which is the typical form, would not suffer in comparison with some of the named garden varieties. Raisers of new varieties should take pains to fertilise good forms only of distinct colours with the pollen of other distinct varieties, removing the pollen of the seed-bearer in time to prevent self-fertilisation. The more upright-growing *P. Cobæa* would form a good pollen-bearer for varieties of *P. Hartwegi*, as the last-named, I fancy, is the hardier of the two; it would do better as the seed-bearer. A native of Mexico, it is found at an elevation of about 11,500 ft. above the level of the sea, and one would suppose that plants obtained from near the regions of perpetual snow would be quite hardy in England, but this is not generally the case either with Pentstemons, or with the Primulacæ and other choice plants. If plants are covered all through the winter with snow they are comparatively safe, and when spring comes they start into active growth again; but in our uncertain climate, with alternate frosts, the plants often suffer during the winter, and unless there are a few plants of each variety under glass, to make good the losses, it is not safe to leave them in the open borders. The garden varieties grow very vigorously if they are planted in deep well-manured soil, and they continue to flower well into the month of October, and sometimes as late as November; but to obtain continuous flowering, the seed pods must be taken off as they form. Mulching and ample supplies of water will be a great help to the plants, by imparting deeper colour to the leaves, and more fully-developed flowers. Cuttings can readily be obtained by taking off some of the side-growths in September, and planting them in fine sandy soil. They do very well in handlights, which should be kept close and shaded until the cuttings are rooted, when air may be freely admitted. The glass seems to be ample protection, even from severe frost. The plants should be kept rather dry, and in that state very little protection is needed to keep them safe. If it is intended to save seed, the pods must be gathered as they ripen, or much of it will be lost.

THE PHLOX.

This is a more favoured flower than the Pentstemon, and, when well grown, it is a very beautiful occupant of the flower garden in autumn; not only do the plants make a brilliant display, but the perfume is delightful. Like the Pentstemon, they require a rich deep soil and plenty of water. The late-flowering section has been brought to a very high standard of excellence; the spikes are compact and well formed, the blooms being quite circular, and of very rich and lovely colours.

This will be a good season to save seed, and some should be gathered from the best varieties. If the florist had no seedlings to flower, and no expectation of obtaining something superior to the varieties already in existence, the great charm of growing florists' flowers would be lost. The object is to get them better than their parents, either in colour or form. The seed should be well dried, and kept in a dry place until the first week in February,

when it may be sown in seed pans, and be placed in a hot-bed to vegetate. The young plants soon appear, and when they are large enough prick them off in boxes about 3 inches apart. Inure them to the open air, and plant them out about a foot asunder in good soil. Spring-struck cuttings grown on and potted in 5 and 6-in. pots are excellent for furnishing the greenhouse at this season of the year. These pot plants may afterwards be planted out in beds.

THE GLADIOLUS.

This is one of the most useful of garden flowers, not only is it conspicuous by its beauty in the flower garden, but the spikes are excellent for cutting purposes. When cutting they should be taken as soon as two or three flowers are open at the base; the remainder of the flowers will open if the spikes are put in water. I have urged the importance of raising seedlings to increase the interest taken in all classes of florists' flowers, and the Gladiolus is so easily cross-fertilised that a child might manage it. The stigmatic part of the flower is very prominent, and the anthers are easily removed before the pollen grains are scattered. The pollen can be moved easily with a small brush from one flower to another. The cultivator must exercise his judgment as to the selection of the seed and pollen bearers. It is well to select a vigorous constitutioned variety as a seed-bearer, with good form in the flowers. If it has rich and well-defined colours, so much the better; but colour can be generally obtained from the pollen parent. This is the proper time to fertilise for seed-saving. The heavy rains have come very opportunely, and will give vigour to the plants. The Gladiolus like a goodly supply of water when growing; and if the plants get very dry at the roots they suffer much, and seldom give good spikes. Caterpillars are doing mischief in some collections; they hide in the axils of the leaves by day, and come out at night to feed. They must be destroyed, or they will eat many of the flowers, sadly disfiguring the spikes. It will be necessary to watch the seed-pods, and gather them as soon as they are ripe. This will be perceived by the pods bursting open at the apex. Remove the pods to a dry and airy place. *J. Douglas.*

BOOK NOTICE.

MARTIUS' FLORA BRASILIENSIS. Volume xiii., Part 3. *Orchidaceæ*. By Alfred Cogniaux. Fasciculus cxiv., pp. 160, tt. 1-34, folio.

BRAZILIAN ORCHIDS.

This stupendous work or series of monographs gradually progresses, and now we have to record the issue of the first part of the Orchids of Brazil, comprising 160 pages and 34 plates. It contains the genera *Selenipedium*, *Habenaria*, *Chloræa*, *Bipinnula*, *Pogonia*, *Pogoniopsis*, *Epistephium*, *Vanilla*, and *Pelexia*. The arrangement adopted is that of Dr. Pfitzer, in Prantl & Eadlicher's *Natürlichen Pflanzenfamilien*, which, it is well known, is based largely upon characters derived from vegetative organs, though we observe one departure from that arrangement in the suppression of the mongrel genus *Paphiopedilum*, in which the coriaceous-leaved species of *Cypripedium* and *Selenipedium* had been combined. Very few of the species comprised in the present part are known in European gardens, the chief exceptions being *Vanilla planifolia*, and the *Selenipedium vittatum*, *caricinum*, *Klotzschianum*, and *Lindleyanum*. Why the three latter are included at all is not clear, because they are stated only to grow in Guiana. *S. palmifolium* is also very doubtfully Brazilian, being included on the authority of a Brazilian specimen referred here by Martius, though it is highly probable that it belongs to the next species, *S. Isabelianum*, Rodr., which was not described until afterwards. Six species are enumerated—we had almost said as Brazilian; but as three of these only grow outside the area of which the work professes to treat, some confusion is liable to result. Works of this kind are frequently referred to in order to see how many species grow in any given area, and probably nine

people out of ten would, on hasty reference, carry away the idea that there were six species of *Selenipedium* in Brazil, as we ourselves did before going through them in detail. One hundred species of *Habenaria* are enumerated, but we have not looked through them to see how many are really Brazilian; so that the point above referred to is a matter of some importance. Two of the eight species of *Vanilla* are likewise not indigenous, though one seems to be included on the ground that some day it will probably be found in Brazil. All such species should be mentioned in separate notes, and not enumerated and described as if indigenous. Nine species of *Epistephium* are enumerated, and here we naturally look for the allied *Sobralia*, and just as we are on the point of concluding that the genus is not Brazilian, we discover by the clavis that it is placed far away in another group, and will be treated hereafter. There are four species of *Pelexia*, but we find no mention of *P. Travassosi*, described in these columns two or three years ago as Brazilian. The thirty-four plates contain excellent drawings, with dissections of fifty-seven species and dissections only of sixteen more, making seventy-three in all. Further comment is unnecessary, as the general character of the work is already so well known. When completed, this volume will be an invaluable standard of reference for the Orchids of this extensive country; and succeeding parts, which will contain more species of importance to horticulturists, will be awaited with interest.

TOURING IN KUMAON.

(Continued from p. 207.)

ALMORA.—Pursuing our way through a considerable Pine-forest, we came to Denapani, one of those charming dry sunny spots on which General Venour (a retired Anglo-Indian) selected for his retiring residence. From this point for some miles the road is very good, and fairly level; after which we encountered a very precipitous and awful descent, which it was only safe to walk down; we got into the valley below about 10 A.M., the sun striking distinctly warm, and probably not a degree below 90° in the sun.

After some miles of characteristic scenery we arrived at Takula, having done 15 miles. Breakfast and rest over, we pursued our way for Bogaswar, some 11 miles distant. This 11 miles is more than usually interesting. After leaving the Takula Bangalow a small river is soon encountered, and bounds the road for some miles. Here and there are several native Hindoo temples at considerable elevations, in all cases surrounded with thickets of Pine trees, forming a circle, so much so, that a young travelling friend, with a fancy for the curious, spotted these temples miles in advance, or rather, he inferred their existence by the peculiar formation of the hills and Pine trees. Some 4 miles from Takula there is a very steep ascent, withal very picturesque; numerous Acacias were in full bloom, and parquets were numerous; lots of straggling and climbing plants were abundant, and as we got to the top, the scenery below was very taking, but, curiously enough, very near the top was a stream of water with huge boulders, small stones and limbs of trees pitched about in Nature's own random way, and here and there most delightful patches of the most intense green Maidenhair Fern. Immediately after this we reached the summit of the hill, and called for a short rest; two lazy bullocks were ploughing in the primitive Hindostani way in the field close by.

It is marvellous how any set of men under the sun, claiming to be civilised, can stand this style of cultivation. The man had two huge bullocks hooked to an idiotic-looking arrangement called a plough, which has a huge spike attached for cultivating the ground; in no case is the soil turned over, but simply stirred about, after which, these paharias (hill-men) bring out a thing called a "koutla," a sort of miniature pickaxe, and break up the lumps; and, to get the soil something like level, they either use their hands, or a thing very like a turf-beater.

Coming across the putwari (a Government land-

agent), I ask him why on earth his people did things in this way? I told him in my country (England) a man would plough his field deeply and well twice over in six hours. He laughed, and said if that were so, these zemindars (farmers) would have nothing whatever to do for about six months in the year, and that this style suited their requirements. The man says, this plough belonged to my father, and before him to my grandfather, and so on, up to about five generations, and what suited my father is quite good enough for me, especially so when the doctrine that the son cannot be equal to the father is borne in mind.

We left the putwari, and pursued our way, and soon came in sight of the snows, which were very effective from this height, and all the more so as the view comes into sight very suddenly. From this point commenced a long descent of some 5 miles through varied forest. Half a mile down the hill there is a superior native garden and bungalow, withal a curious mixture of native and English ideas. A magnificent specimen of *Poinsettia pulcherrima*, some 10 feet high and through, with numerous fine heads of bracts, was noted; also some fine specimens of the *Agave americana*, both variegated and plain, and numerous other plants. Two very fine golden eagles were seen near this place. A little further on the road, a magnificent Pine forest ensues; many of the specimens [*Pinus longifolia*, Ed.] measure 8 to 10 feet in girth, and run up straight for a great height, giving, I should say, 70 to 80 feet of splendid timber. There must be millions of these trees in Kumaon, which, owing to the very great transit difficulties, are next to useless; the timber from Kumaon Pine is of the best quality, and very durable. Towards the end of this forest there is a charming little piece of scenery worth noting; close to the road a ravine is faced with stone or rock, and descends below perhaps 50 or 60 feet almost perpendicularly. In the ravine surrounding the pool are to be seen several plants of *Phoenix sylvestris*, numerous rampant climbers smothering up the trees round about, and helping to make up a pretty piece of scenery that would look very charming in a photograph. Soon afterwards we came to the river, and crossed over on the other side. From here to Bogeswar (about 2 miles) is on the flat entirely, being in a fairly broad valley. Here, too, is sighted for the first time the Holy Surgu River, to which all the Hindoos who can afford it consign the charred bones of their dead. This river comes direct from the snows, and hence it is considered holy.

BOGESWAR.—In the course of fifteen minutes we reached the Dak Bungalow, which is a large and spacious one, just off the River Surgu, and very charming in the day-time. Formerly Bogeswar used to be a place of some considerable note and trade. Here the largest fair in Kumaon is still held in the month of January, but its glory has largely departed, and it is a mere ghost of its former self. The Bhootias now deal direct with the plains, more or less. The Bhootias are monuments of persistent industry; most of them are wealthy, and first-class men of business in their own particular way.

The Borax Trade.—Their great article of trade is Borax, of which enormous quantities are brought down, and in due course pass into the hands of merchants at Ramnuggar and other places, from whence it finds its way to all parts of the world. It should be borne in mind these very hardy people come from the other side of the snows, and the passes are not only very few in number, but full of difficulty and danger. Most of the borax of the world has to be carried some two hundred miles on sheep and goats, and in the season you meet miles of sheep and goats with two peculiar-made bags, holding about a gallon each of solid matter more or less, and covered outside with leather. These are placed in a peculiar way across the sheep's back, and looped round the neck and tail, so as to go up and down hills with equal safety; and thus the men and sheep trudge along day by day till they reach their destination. When the day's work is done they take off

the loads and pile them up in straight stacks, and cover with blankets. As night comes on, branches of trees are cut down, and a sort of enclosure is made for the sheep and goats. These are eventually huddled pretty close together, and a large fire lit in front, and with the aid of two or three Bhootia dogs any leopards are generally kept at bay, and thus night by night passes away the life of the Bhootia, under the pure air of heaven only, though in some places he can take advantage of what are called *dhuramsalas*, which may be said to be wayside stables. The Bhootias themselves generally wear a pair of loose-fitting trousers, and a long peculiar-made coat of pure wool, made direct from the sheep's back. They also carry all their kits and food. Some have their wives, but in all cases the women dress very like the men; and it is only from observation that you can at times make out the man from the woman. They rise remarkably early, and are generally the first on the road.

As a rule they are very respectful men, and at once greet a European with a salute, and "Salaam, Sahib." Although Bogeswar is very pleasant in the day-time, it is intensely foggy and cold at night. It is not that the thermometer goes very low, but there is great fluctuation in the temperature. The day temperature in the sun, even in November, will scale 100°, whilst the night temperature goes down to 40° F. Some handsome young Chestnut trees are doing well in front of the bungalow, and Oranges thrive, as do also Plantains in the neighbourhood.

At 9 A.M. next morning my friends left me, and I struck out for Kubcote alone. This is due north, and off the beaten track; very few Europeans go that way except, to a limited extent, for sport, in the winter season. The road to Kubcote is for its entire distance along the side of the Surgu, and is comparatively level and easy travelling. There are some striking pieces of scenery along this road, both on the river and land. A huge conical hill rises to an altitude of 8000 feet. Numerous piles of rock can be seen projecting here and there, some of a reddish granite-like colour, others whitish, with black striping, obviously due to the action of water. Dotted about in a charmingly irregular manner were numerous wild Date-palms, averaging about 30 feet high; these were mixed with numerous trees of a semi-tropical character. Here and there were some magnificent clumps of drooping Bamboos of the most intense green; seen from the distance, they forcibly remind one of giant Maidenhair Ferns. Some of the trees had the most beautiful autumn tints coming on, but, for the most part, the bulk were in luxuriant foliage. Down below, some 50 to 100 feet, is the beautiful river, with the purest of water; in places it is very deep, elsewhere it is shallow, and here and there are huge boulders and rugged places, causing the water to seethe and foam in its rapid course. The aspect is due north, and from the time I saw it, 11 A.M., I imagine the sun very rarely sets on any portion of the north side of this grand hill; the soil appeared to be dark, rich, and continually moist. Away, right at the very top, is a dead Fir-tree, with more than usually distorted branches, that look exceedingly strange and weird. Further on are numerous other pieces of scenery, and colonies of *Phoenix sylvestris*, but none so admirable as that just described. Close here I had the good fortune to shoot a very fine sample of the wild duck; these wild ducks are about the size of an English goose, very fair eating, and quite worth looking after out in the district miles away from all sources of supply of any kind.

After another mile or so, the country opens out; on the side of the road was to be seen a small scrubby, prickly kind of a bush, growing in batches about 2 feet high, with numerous berries of a yellowish colour, and quite the size of marbles, which I do not remember to have met before in Kumaon in berry. Along this part of the road were to be seen numerous trees covered with evidently a small kind of *Dendrobium*—unfortunately none were in bloom. I noted they were all growing on one particular kind of tree, called *Othece* by the natives. It looked like a species of Birch, and is

rarely found far from water. The wood is light and white in colour, and excellent for box-making, but will not stand exposure.

A little further on is a large village and numerous Plantains of the ordinary kinds grown in Kumaon. They very rarely exceed 15 feet in height in Kumaon, but bear fruit profusely. The largest is of a dull reddish colour, the next largest is yellow, and of better quality; but the best is smaller in size, and pale yellow. This latter has all the delicate aroma and flavour of the best Bananas obtainable on the plains of India. They were very cheap; for about half-a-crown one could easily get a hundredweight. *F. W. Seers, Ramghur, June 25, 1893.*

(To be continued.)

TREES AND SHRUBS.

PAVIA MACROSTACHYA.

FLOWERING, as this species does, a month or six weeks later than the other *Pavias* and *Æsculus*, its value is considerably enhanced. For a small garden, it is the most suitable of all the species, old specimens only attaining a height of 7 or 8 feet. It is extremely handsome in habit, and well adapted for planting as an isolated specimen on lawns, forming a rounded shrub, with the lower branches sweeping the ground. It increases in size mainly by sending up suckers, ultimately constituting a thicket of slender stems several feet through. The leaves are palmate, and are made up of three to seven leaflets (usually five). Terminating each branch, and contrasting finely with the deep green foliage, is a long, erect, and many-flowered raceme. Individually the flower is small, and of a faint pink-tinted white; the beauty of the raceme is greatly heightened by the numerous long thread-like stamens, which are also pinkish-white (not chocolate-brown, as is sometimes stated). The species rejoices in an extensive synonymy: *Pavia macrostachya* is the name by which it is commonly known, but in Nicholson's Dictionary it is described under *P. alba*; it is also known as *Æsculus parvifolia*, and is a native of the South-eastern United States, from whence it was introduced to this country in 1820 [It was figured in our columns, Nov. 24, 1877, p. 656. Ed.]

HEDYSARUM MULTIJUCUM.

There appears every likelihood that this leguminiferous plant will prove a useful addition to hardy shrubs. It was figured ten years ago in *Garten Flora*, t. 1122, but although catalogued for sale by some of the continental nurserymen, its cultivation in this country appears to be almost or altogether confined to botanic gardens, and at Kew it has been flowering throughout the summer. It is described in the *Garten Flora* as coming from the deserts of Southern Mongolia, and growing to a height of 5 feet. It is of somewhat sparse but not inelegant habit, the slender shoots growing in a zig-zag fashion. Its grey-green leaves are pinnate, 6 inches long, the petioles and under-surface of the leaflets covered with minute hairs. The racemes vary from 8 inches to considerably over 1 foot in length, the upper part bearing numerous papilionaceous flowers, each $\frac{3}{4}$ inch across. The flowers have been described as pink or flesh-coloured, but either the species is variable, or this is an error, for on all the plants I have seen they are of a glowing magenta-purple, with an orange-coloured blotch in the centre of the standard petal. The racemes, as well as the flowers themselves, are very like those of the well-known Australian plant, *Swainsonia galegifolia*. Flowers are produced from every joint of the current season's growth, and this year the plants commenced to flower in May, and are still—in August—producing their racemes freely; they will, no doubt, continue as long as we get a fair amount of sunshine, and the nights do not become cold. Notwithstanding its desert origin, this shrub likes liberal treatment, and should be grown in an open loamy soil; it must also be silted in a sunny position. Propagation is effected by layers and cuttings, or by seeds, which do not, however, ripen in great quantity.

DABEOCIA POLIFOLIA.

This charming little Ericaceous plant is now fully in flower, and will doubtless continue so for some weeks to come. It is a native of the moorlands of south-western Europe, and is found also in Mayo and Connemara, in Ireland, where it is popularly known as St. Dabeoc's Heath. It is of dwarf habit, growing to little more than 1 foot in height. The leaves are small, of a deep green above, but covered beneath with a white tomentum. Standing well above the foliage are the erect, terminal racemes, whose pendent blossoms are borne on short stalks, and are bell-shaped. Their colour differs according to the variety, the typical form being purple; a white-flowered variety was found in Connemara in 1820, and there is also a parti-coloured one, in which one half the spike—or even half the flower—is purple, and the other half white. Like most of its class, this *Dabeocia* prefers a peaty soil—one half, however, may be loam, provided it is light and sandy. It may be propagated by layering the outer shoots during July. *W. J. B.*

HYBRIDISATION OF THE ACACIA.

THE difficulty of distinguishing one from another the four hundred species of *Acacia* is often very great, as in many cases the difference is slight.

After seeing how freely they cross-fertilise when growing together in the Riviera gardens, I do not hesitate to express my opinion that many of them are natural hybrids. When growing together in variety, as they do here, it is natural that they would hybridise one with the other.

Around the plants that have produced seed, hundreds of young seedlings spring up in a very short time, and amongst these are often to be found some which deviate from the parent plant. I have recently had the opportunity of noting a very distinct hybrid of this kind. The gardener sowed some seed of *Acacia cultriformis*, which he took direct from the plant which was growing beneath another species called *A. petiolaris*.

Amongst the batch of seedlings several very distinct varieties appeared, showing in varied degrees the character of the two species. It is also remarkable that the seedlings assumed the character of the pollen plant as to the foliage, and in most instances were more or less variegated, as the one species has a silvery foliage and the other dark green. *Riviera.*

NOTES FROM DAVENHAM BANK, MALVERN.

THESE gardens contain something beautiful and interesting at all periods of the year, each nook and corner having some floral treasure. At the present time, the chief features of interest are the Grapes, Peaches, Nectarines, Pears, flower garden, and kitchen garden crops. The Muscat-house is occupied by four old Vines, which at one time were condemned to be destroyed. They are bearing one hundred bunches of excellent Grapes; the bunches are not large or sensational, but are of useful size, the berries well thinned, and of average size, and of a delicate pale amber tint rarely seen. An adjoining viney has been planted three years, and this year each Vine carries seven bunches. The bunches of Madresfield Court are medium in size, but having superb berries in size and finish. The late viney was planted with young Vines last February; these were allowed to grow to a length of 12 or 13 feet, and then stopped. They are strong and short-jointed canes, such as we seldom see. The average length from joint to joint is about 4 inches.

Good crops of beautiful Peaches and Nectarines are in the Peach-houses, the Nectarines especially being highly coloured—Stanwick, Pitmaston Orange, and Lord Napier being conspicuous. In the Pine-pits are noticeable several dwarf smooth-leaved fruiting Pines that were received as suckers a few months ago from the West Indies. The fruits of these are small, but are remarkable for their high

flavour and juiciness, as well as for their weight in proportion to size. Probably more will be heard of these Pines at some future time.

Some heavy crops of Pears, on pyramidal and espalier trees, are to be seen in the kitchen garden, and growing on the slope of the Malvern Hills, the fruit is very fine. The best are Williams' Bon Chrétien, Vicar of Winkfield, Marie Louise, Thompson's Glou Morceau, Baurré Diel, Easter Baurré, and Pitmaston Duchess.

In the conservatory is a mass of *Primula obconica*. The effect produced is very striking. Mr. Bradshaw is always happy in the massing of colours, and by such means produces some charming effects. The old-fashioned "Bridal Wreath" plant (*Francoa racemosa*) is present in numbers in the conservatory.

Excellent crops of Onions, Carrots, Parsnips, Sprouts, &c., are in the kitchen garden, notwithstanding the dry season and the sharp slope of the ground. *J. Udale.*

CHRYSANTHEMUM LADY FITZWYGRAM.

THIS early-flowering variety, raised from seed by Mr. Agate of Havant, is a capital sort for affording early white flowers; and, if anything, it is an improvement upon Madame Desgranges, the florets being whiter. Plants, 2 feet high, laden with flowers, are lovely objects, even at this time of the year, when hardy flowers are plentiful. Full-sized blooms do not attain the dimensions of those of the Desgranges varieties, but for the various purposes of the commercial florists' art the variety will be appreciated. *E. M.*

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

WINTER SPINACH.—In most districts, except those in the extreme south, the last batch of this useful vegetable should now be sown, that the plants may have sufficient time to establish themselves thoroughly before cold weather. The seed should be sown as previously advised, but it will not be necessary to thin out to such an extent as those sown earlier. Previous sowings may be thinned as the plants get large enough to handle, for they soon spoil if allowed to become overcrowded.

TURNIPS.—On good ground in the south these may still be sown, for if the autumn be mild, good-sized roots will be formed, which will stand the winter and may prove useful in spring. If, however, the autumn be cold, so that no bulbs are made, the plants will yield a supply of wholesome greens. There is also an advantage in late sowing, as they do not so soon go to seed. Early bulbing kinds only should be sown now. Run the hoe through those already up, and thin as soon as large enough.

TOMATOS will need more attention as the days get shorter, for the temperature falls very low after hot sunny days occasionally, causing more moisture in the atmosphere at night, which often condenses on the foliage of the Tomato, and causes specks of mildew to appear. In this event, the foliage should be dusted with sulphur to ward it off. Keep all fruits cut at the first signs of colouring, as this assists the smaller ones to swell more rapidly. Pinch out all superfluous growth, so as to throw the sap into the swelling fruit. Should bad weather set in, causing disease to make its appearance, gather any fruits that may be large enough for use, for if allowed to remain on the plants, they will soon rot.

RIDGE CUCUMBERS in the open should now be producing plenty of fruit. It is well to be prepared with mats or other light covering, in case of early frosts, as these, especially in low districts, cut down the plants just as they are in full bearing; whereas by a little forethought, plenty of fruit could be had for a long time afterwards.

CARDOONS.—Owing to the abnormally low rainfall of the present season, these plants are backward, and blanching may be deferred for a short time longer, unless they are early and robust, when the

operation may be commenced at once. Previous to so doing, the plants should have a liberal watering at the roots, but the foliage must be allowed to get quite dry before being covered.

SALADS.—As the days get colder, these are not so much in request, but a supply should be kept up to meet any demand that may arise. Small sowings of Mustard and Cress should be made at intervals. Onions to be drawn when small should either be sown in pans or in a cold frame. Radishes should be sown thinly on a warm border, so that roots may be formed early; for this purpose, the short-topped kinds are best. Endive may be blanched as required for use, while Lettuce should be encouraged to make free growth. Celery will now be coming into use, so that some of the more tender green salads will be discarded.

HERBS will soon cease to make growth outside, especially such tender kinds as Basil and Savory. A sowing of these should be made in a pan or cold frame to produce plants for winter.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

SPRING-FLOWERING BULBS.—Early White Roman, Blue Roman, and Double Roman Hyacinths, Polyanthus Narcissus, Campanella Jonquils, and a selection of the single varieties of named Hyacinths for early flowering, should now be potted. Good sound bulbs of medium size should be selected and potted in batches from the present time until the end of October, at intervals of about ten days or a fortnight. Use well-decayed turfy loam, with about a fourth part of old rotten rich dung, leaf-soil, and sea-sand, to which add a small quantity of Clay's Manure. A good heap of this compost should be prepared by well mixing it together, and throwing it in a heap, where it may be protected from rains, so as to be ready when required. Clean pots should be prepared, and they should be well crocked. Some fertilising moss or dried cow-dung should be placed over the crocks, and the pots filled with soil, and a handful of sea-sand put on the top; press the bulbs firmly down into it, fill round with soil to make the bulb fast, and leave the top of it exposed. Do not pot the bulb too high, but leave sufficient space to give a good watering when required. Place the pots on a level bed of ashes, then give a thorough watering, and allow them to drain for a time, afterwards cover them with from 12 to 18 inches of ashes, and let them remain for a month or six weeks, until they have filled the pots with roots. Care should be taken not to let them stay too long under the ashes, but when about an inch high remove them to a cool greenhouse, and gradually expose them to the light, when they may be put in a gentle heat as required. Early Van Thol and other Tulipa should be treated in the same way. Nerine sarniensis (the Guernsey Lily), should be potted as soon as possible, and placed in an airy position in a cool house, where it will soon be in flower. Great care must be taken not to break the flower-buds in so doing. There are several other beautiful varieties of this useful bulb worth growing, viz., *N. corusca*, *N. crispa*, and *N. Fothergilli* major. Continue to pot a batch of *Tuberosa* every three weeks; they will come in useful during the dark days. *Vallota purpurea* growing or in bloom should be helped with a liberal supply of manure-water to strengthen the bulbs for another year.

GENERAL WORK.—A batch of *Coleus* cuttings and of *Cyperus alternifolius*, should now be put in for winter work; they will quickly strike and make useful table plants if placed in small pots in a moist heat. *Grevillea robusta* should be propagated from seed; they are most valuable for decorative purposes, and should be well fed with manure, and syringed freely to keep down spider; they form nice decorative plants grown in 5-inch pots in peat, loam, and sand. *Eulalia japonica variegata*, *E. albo vittata*, *E. gracillima univittata*, and *E. zebrina*, are most useful plants, grown in pots for house decoration. They are hardy, and will stand a long time in a cool-house without injury. They are increased by divisions of the roots, and if put in large sixties they are useful for table-work; but for vases or groups, where their long graceful foliage is most effective, they are best in 8 or 10-inch pots. Give them well-drained pots and good rich loam, leaf-soil, and sand, with manure waterings occasionally. They grow well in an ordinary greenhouse, and like plenty of air. *Eucalyptus citriodora* has an agreeable sweet

lemon-scent, and is useful also for decoration. *E. globosus*, the Blue Gum of Tasmania, is well-known for its medicinal qualities. Both varieties are very useful grown in small or large pots for placing in halls or corridors, and are easily raised from seeds. They may be placed outside during the summer, and removed to the greenhouse or conservatory for the winter. *E. citridora* likes a warm-house when the plants are young. *Primula sinensis fimbriata* should be potted on as they require it; when placed in the blooming-pots, it is a good plan to give them three small pegs close to the stem, to keep the plants from falling about when carried.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maizen Erleigh, Reading.

STRAWBERRIES.—If any have deferred the planting of these, they must not longer delay, for the crop of fruit to be obtained from the plants next season depends upon the growth which they make this autumn. And it is possible that the growing season may not last more than a few weeks at the longest. When the general planting is finished, plant out those intended to supply runners for layering from next season. We generally select a piece of ground convenient to water, and in an open position. The plants are put out 3 feet 6 inches from row to row, and 18 inches apart in the row. A good distance between the rows prevents the sorts getting mixed, where only one row of a sort planted across an open quarter is required for layering from. Vicountesse II. de Thury, as was anticipated when the fruiting season was over so early, promises to produce a very useful second crop, and if the litter was removed when the quarters were cleared of runners and weeds, it will be well to give the plants a good root-watering, and then litter them down with rather long dry grass which is free from seeds. Failing the grass, and if straw litter only can be obtained, defer the watering till after it has been placed about them, which should be done as early as possible. Keep runners removed from all plantations, and keep down weeds with the hoe whilst the weather is suitable for doing so.

AMERICAN BLACKBERRIES.—Thin out the young growths, leaving only sufficient to be trained in at 1 foot apart after the bearing growths have been removed. Tie them up somewhat loosely now, as where they are allowed to bend over, the check given to the flow of sap induces the lower buds to start into growth, which should be prevented if possible. If such does take place pinch or prune back to one leaf, and repinch again later on should such be necessary. This season should prove an ideal one for ripening the growths of the variety Wilson Junior. Instead of depending entirely upon this variety, *Rubus laciniatus* should be included in the most select collections. As being quite hardy it is consequently a sure bearer, and is also ornamental.

APPLES, ETC.—Despite root-waterings the great heat is seriously affecting the Apple crop, and causing premature ripening. Both mid-season and late sorts have ceased to grow. Rather than gather the crops of all sorts which are dropping fruit so badly, go over the trees regularly to gather any fruits which have ripened, and place a good bed of some soft material under the trees to prevent any fruit that may fall from being badly bruised. The grass mown from the orchard, and which has not been allowed to ripen seed, is the most suitable material to be used for the purpose. Pears withstand the heat much better than Apples, and given copious root-waterings, the fruits that can be saved from wasps will be very fine. Continue to give copious waterings to all trees now bearing, and to those from which heavy crops of fruit have been gathered. Also to autumn and summer-fruiting Raspberries.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

THE INTERMEDIATE-HOUSE.—*Odontoglossum grande*, *O. Inslayi*, *O. I. leopardinum*, *O. I. splendens*, *O. pulchellum majus*, *O. coronarium*, *O. miniatum*, *Oncidium ornithorrhynchum*, *O. o. albidiflorum*, *O. incurvum*, *Epidendrum vitellinum majus*, *Maxillaria grandiflora*, *M. Harrisonia*, *M. venusta*, and *M. Sanderiana*, all do well in this house. *O. grande* will now be swelling its new growths, from which the flower-spikes will come. They should be sponged over with soapy-water, a little of the old potting-material removed from around the new

growths, and a little new peat and sphagnum moss added, which the new roots will soon run into, thus assisting them to carry the flower-spikes, which, if they are good, constitute a great strain on the plants. Give them plenty of water until the flowering period is over, and the pseudobulbs are well ripened, when less will be needed. Keep a good look-out at night for snails and cockroaches, or the fleshy spikes and growth will soon be damaged. Snails seem more partial to this *Odontoglossum* than to any. *Odontoglossum Inslayi* are growing very freely now, and will flower later on; they must not want for water, but care must be exercised in seeing that they do not get too much. *O. pulchellum* is growing away, and will take a plentiful supply of water, both at the roots and overhead, always providing they have plenty of roots. *Oncidium*s such as mentioned, also *O. varicosum Rogersii*, *O. tigrinum*, and *O. Forbesii*, will mostly be showing their flower-spikes, and must be well looked after in the evening, to prevent injury from snails, &c. They must be watered carefully until such time as the new bulbs are made, and the flowering is over. *Maxillaria grandiflora* is nearly always in flower if good plants be had, and it comes in useful for buttonhole-making, &c. They should be well supplied with water, and be sponged over occasionally to keep down red-spider, which is rather troublesome, especially so after the hot and dry weather we have had. *Ada aurantiaca* is making fine new growth, and this also requires plenty of water whilst growing, and it should be looked over occasionally for a mealy-white scale which gets on the under-sides of the leaves, and which must be sponged off. *Epidendrum vitellinum majus* we find does well in this house, hung close up to the roof-glass. *Pleione Lagenaria*, *P. maculata*, will be completing the new bulbs, but must not be allowed to become dry until such time as they have flowered. Weak manure-water will be beneficial to them, and they should be got up to the roof where they will get plenty of air. *Dendrochilum filiforme* having passed out of flower by this time, will need to be kept rather dry than otherwise, and the same applies to *D. glumaceum*. *Lycaste Skinneri* growing at the warm end of the *Odontoglossum*-houses will need plenty of water at the roots, but not overhead. The earliest ones are just beginning to put out the flower-buds; an occasional watering with some kind of liquid manure-water will help them. All the houses should be well damped and syringed for the present, and the summer temperature kept up for another month, but always give as much air as can safely be given. Our fires have not been let out at all during the very hot weather, as I find the air circulates better when the pipes are just warm; the thermometers may be all right in the mornings, but without a little warmth in the pipes the hottest houses feel damp and chilly.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINES.—If the roots of early-fruiting Vines are thought to be in an unsatisfactory condition, it is advisable to find out the cause as soon as the fruit is cut. Where there is a small quantity still hanging, it may be cut and bottled in the usual way. It is important to get the roots in the new soil as early as possible, and the wounds caused by lifting, healed before winter arrives. Early Vines are more easily renovated than late ones, because one can get the roots active again while the foliage is still maintained. The first thing necessary is to provide plenty of good loam; and then search carefully for the roots, beginning at the extreme points, and working very carefully with a fork, and saving every rootlet. Clear out everything down to the drainage, and if that is faulty, remove it, and secure a good outlet for water, and afterwards place some fine gravel or small broken bricks over the course drainage to prevent the roots from descending into same. Place some turf with the grass towards the drainage over this, and then some soil. The roots should then be laid out evenly over the compost, which need not be more than some lime-rubbish, and a special manure well incorporated with the new loam. The roots may be brought within 6 inches of the surface, and carefully covered with the soil. If roots of Vines are in outside and inside borders, one half could be done now, and the other portion next season. Three vineries, which we renovated piece-meal during the past two years, have done very well. Leaves of ripened Vines should be removed as soon as they are of no further service to the Vines, but green leaves should be kept healthy as long as possible. Laterals on early Vines should be closely

stopped—a healthy rest is indispensable to early-forced Vines.

MELONS.—The bines, whether growing singly or in pairs, should be stopped as soon as they have grown long enough to carry three or four fruits; pinch out the tops of the laterals at one or two joints beyond the fruit, and let them have all the light possible. Impregnate as soon as the number of fruits required have appeared, and withhold the syringe till they are set. A temperature of not less than 70° should be maintained. Those grown in pits heated by means of fermenting manure should have the linings often renewed; a heap of leaves and manure mixed together should always be in readiness where heating depends on such means. Plants growing under such conditions require judicious application of moisture; in damp weather, the foliage should be kept as dry as possible.

TOMATOS.—If foliage has become gross, and excludes light, it may be shortened, and every lateral not required should be removed when they are quite young. If the plants are to fruit into the winter months, they require all the air they can stand to render the growth firm and fruitful; cropping should be moderate, and give no liquid manure till the soil is full of roots.

THE FLOWER GARDEN.

By T. H. CRASP.

ALL seedling biennials, such as *Claotharas*, *Canterbury Bells*, &c., that were sown at the end of July, will be greatly hardened by being transplanted, and, when possible, the best plan is to plant them permanently where they will be required to bloom next year. Herbaceous borders should receive strict attention in the matter of staking and tying, especially the tall-growing subjects, so as to prevent the flowering shoots being broken off by the wind. Remove the old flower-spikes immediately the beauty of the flower is past, where seed is not required. Also attend well to the staking and pegging of all bedding plants, as well as to the removing of all decayed foliage and bloom. Lawns should be kept well mown, and edges clipped, for if such work is not kept well under at this season of the year, a place soon becomes unsightly and untidy.

ANTIRRHINUMS.—The best way of perpetuating any superior varieties is to propagate by cuttings, which root very readily at this season of the year. Short flowerless shoots should be slipped off the old stems near the ground, and dibbled into handlights or cold shallow frames, in a cool and somewhat shady position. When struck, remove the lights until frosts occur, and afterwards they will require the same treatment as *Calceolarias*. If these are planted out early in the spring, they will flower splendidly during the summer. Many beautiful varieties may be obtained from seed, and should be sown now in preference to the spring. Sow in pans or boxes in sandy soil, and place under a hand-light in a cool position, where the seed will soon germinate. When the seedlings are large enough to handle they should be dibbled into boxes of good light soil, and remain in cold frames till next spring, when they may be planted out at the same time as the cuttings.

POTENTILLAS.—These showy hardy perennials are very useful for cutting during the months of May, June, July, and part of August; they are readily propagated by division in early spring, as well as by seed, which should be sown at the present time in shallow boxes filled with light soil. When the seeds have germinated, prick the young plants a few inches apart into boxes, or a warm border, finally transplanting them into their flowering positions when a favourable opportunity occurs.

PLANT PORTRAITS.

LINARIA DALMATICA.—Perennial. Flowers yellow. D. Dewar, in *Garden*, July 29.

MASDEVALLIA ABBREVIATA, *M. aristata*, *M. floribunda*, *M. fragrans*, *M. guttulata*, *M. ionocharis*, *M. melanopus*, *M. militaris*, *M. racemosa*, *M. xanthina*. *The Genus Masdevallia*, Miss F. Woolward, Part IV.

MASDEVALLIA HARRYANA VARS., *Lindenia*, t. 382.

MILTONIA WARSZCIEWICZI, *Lindenia*, t. 383.

ODONTOGLOSSUM CRISPUM VAR. *FERDIENSIS*, *Lindenia*, t. 381.—A very beautiful variety, flushed with rosy-violet, and heavily blotched with maroon.

SOLANUM CRISPUM, *Garden*, July 22.—Hardy wall plant. Chile. Flowers purple.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

PLANTS, &c., TO BE NAMED.—Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week. Specimens should be carefully packed and numbered, and not more than six should be sent at one time.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

TUESDAY, AUG. 29. { Royal Horticultural Society: Committees at the Agricultural Hall, Islington.

SHOWS.

TUESDAY, AUG. 29. { Royal Horticultural Society, at the Agricultural Hall (four days).

WEDNESDAY, AUG. 30.—Bath Horticultural.

FRIDAY, SEPT. 1. { National Dullia Society, at Crystal Palace (two days).

SALES.

MONDAY, AUG. 28. { Trade sale of Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, AUG. 31. { Trade sale of Dutch Bulbs at Protheroe & Morris' Rooms.

FRIDAY, SEPT. 1. { Trade sale of Dutch Bulbs at Protheroe & Morris' Rooms. Orchids at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 2. { Trade sale of Dutch Bulbs at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—60°.4.

Agricultural Hall Show.

ON Tuesday, August 29, the great show of plants, flowers, fruits, and horticultural sundries, will be opened at the Agricultural Hall, Islington, by the Royal Horticultural Society, and will remain open to the public until the night of September 1. The members of the Fruit, Floral, and Orchid Committees will meet on the 29th inst. at 11 A.M. precisely, but will be admitted at the Barford Street entrance as early as 10 o'clock. They are particularly requested to wear the badges given out at the last Temple Show, and to have their Fellow's pass and tickets with them.

As the catalogue of the show must go to press on Monday, it is hoped that all exhibitors will have given particulars as to their exhibits by that day to the Superintendent of the Royal Horticultural Society's Gardens, Chiswick, as otherwise they cannot possibly appear in the catalogue. We understand that the number of trade exhibits will be large.

As some difficulty may be experienced by those not familiar with the geography of London in reaching the Agricultural Hall, it may be well to say that omnibuses run from all, or nearly all, the great railway stations to the "Angel" at Islington, which is within a very short distance of the Hall. King's Cross Station, on the Under-ground Railway is also a convenient place for visitors, as it is in direct communication with the Great Western (Paddington), Addison Road, Baker Street, Euston [indirect], Midland, Great Northern, and Great Eastern

Stations. King's Cross is also easily reached by the Under-ground from Victoria, Charing-Cross, Earl's Court, Ludgate Hill, Cannon Street, and Mark Lane, or Aldgate (for Fenchurch Street). From King's Cross the trams and omnibuses to the Angel are very numerous.

Highbury Station on the North London Railway, is within a few minutes' ride of the Hall, in omnibus or tram. Passengers coming from Waterloo and South-Western Stations, should enquire for a "Favourite" omnibus. If one omnibus or tramcar does not offer facilities, try another, and, if in difficulties, "ask a policeman." In all cases ask for the "Angel"! and if time is an object take a cab.

LILIUM JAPONICUM VAR. ALEXANDRÆ

This is the Lily which was shown at the meeting of the Royal Horticultural Society at Chiswick, under the two names, R. Ukeyuri and of L. Alexandræ (fig. 44, p. 243). The plant has an indefinable appearance of a hybrid, in the confection of which *Lilium auratum* may have had a part. The flowers are pure white. A full description of the plant, by Mr. BAKER, is given at p. 86.

THE BIRMINGHAM GARDENERS' ASSOCIATION.

—The annual excursion of this Society took place on the 14th inst. The party journeyed to Windsor, where an inspection was made of the Castle and its gardens. Mr. OWEN THOMAS gave his hearty assistance, and did everything in his power to ensure the comfort of the large party of nearly 200, and a very enjoyable day was spent, notwithstanding the great heat.

THE WORLD'S FAIR.—The last number of the *American Florist* contains no fewer than four hundred portraits of "florists," or, as we should say, market growers, on the occasion of the great gathering of the community at St. Louis, and of the meeting of the Horticultural Congress in Chicago. The delay in getting the jurors to work at the Fair is seriously complained of, not only by foreign jurors, to whom time is specially precious, but also by natives of the States.

THE DUCHESS GRAPE.—This Grape, of which we gave a slight account in a recent number, based on that given in the *Revue Horticole*, may be seen against a wall at Chiswick with other outdoor Grapes. It is, we believe, not highly thought of by Mr. BARRON.

HORTICULTURAL CONGRESS AT CHICAGO.—

The following is the outline programme for the General Horticultural Congress, held at the Art Institute, Adam Street and Michigan Avenue, Chicago, which began August 16, and continued three days:—

SEEDSMEN'S SESSION.—Seed Growing—Its Past, Present, and Future: Henri L. de Vilmorin, Paris, France. Seed Growing in Denmark: J. Pedersen, Bjerggaard, Copenhagen. Comity in the Seed Trade: Jas. J. H. Gregory, Marblehead, Mass. Knowledge in the Seed Trade: E. V. Hallock, Queens, N.Y. Selection in its Relation to Seed Growing: C. L. Allen, Floral Park, N.Y. American Seed Growing: C. C. Morse, Santa Clara, Cal.

GENERAL SESSION.—Technical Horticultural Education: Prof. Wm. Trelease, of Mo. Botanical Gardens. Improvement and Care of Public Grounds, Developing and Conserving Natural Beauty: Wm. McMillan, Buffalo. Relation of Experiment Stations to Commercial Horticulture: Chas. W. Garfield, of Michigan. Horticulture and its General Relation to Art.

FLORIST'S SESSION.—The Past of Floriculture: Prof. G. L. Goodale, Cambridge, Mass. The Present of Floriculture: R. Craig, Philadelphia. The Future of Floriculture: E. G. Hull, Richmond, Indiana. Hybridisation and the Benefit Accruing to Horticulture: Prof. Chas. Naudin, Antibes, France. How Best to Subserve and Protect the Interests of the Originator of New Plants: Luther Burbank, Santa

Rosa, California. The Packing and Shipping of Plants. The Utilitarian Advantage and Importance of Floriculture.

NURSERY SESSION: *General*.—Japanese Nurseries, Dwarfing of Plants and Miniature Gardening, Henry Izawa. Inter-State Laws to Control Insects and Diseases: Edw. Willets, John Rock. Forestry and Nursery: Herr Runnebanm, Eberswalde, Prussia. *Specific*.—In Europe—Present Status of the Nursery Trade: Victor Lemoine, H. Waterer. In the South, in the Mississippi Valley, On the Pacific Slope: W. R. Williamson, Seth. Llewellyn. History of Nursery Business in America.

POMOLOGICAL SECTION: *General*.—Amelioration of Native Fruits by Artificial Crossing and Selection. Location and Environment as Affecting the Evolution of Fruits, Mediterranean Fruits, Catalogues and Nomenclature: T. T. Lyon, South Haven, Michigan. *Specific*.—Our Citrus Belts, Commercial Apple Culture, Peach Areas and Problems, Vine Culture and Products.

PISTILLODY IN POPPY.—Certain plants are peculiarly subject to particular changes, why we do not exactly know. A not uncommon malformation in Poppies is the more or less complete substitution of pistils or carpels for stamens. Mr. WOLLEY DON kindly sends us a good illustration of this change.

ORCHIDS AT KEW.—We noted this week a twenty-flowered raceme on the delightful little *Bulbophyllum barbigerum*, the flowers bobbing up and down like lively little caterpillars. *Rodriguezia pubescens* is a beautiful white-flowered basket Orchid, as represented by a nice specimen in flower now. *Disa cornuta*, *Satyrium militare*, and *Stenoglottis longifolia* are three interesting, and in the case of two at least, ornamental rarities. A new *Bulbophyllum*, a new *Stanbopea*, a healthy two-spiked plant of *Vanda Sanderiana*, *Catasetum Darwinianum*, *Aqanisia ionoptera*, *Dendrobium Mirbelianum*, and *Vanda cœrulea*. There are numerous choice *Cypripediums* in flower, one named C. Victoria Maria being a dull-coloured form of C. Chamberlainii.

HYBRID CLEMATIS.—Our excellent colleague, M. ED. ANDRÉ figures and describes in the current number of the *Revue Horticole* (August 16) a hybrid raised at Lyons by M. MOREL between *Clematis Pitcheri* and *C. coccinea*, the former having been the seed-parent. The plant is like *C. coccinea* in habit and foliage, and like *C. Pitcheri* in the form and the ground-colour of the flowers.

THE HAMPTON COURT VINE.—The *Standard* has been discussing the history of this Vine. It is, we believe, an offshoot of the Vine at Valentines, near Ilford, and may have been planted by WILLIAM ROBINSON, Secretary to the Board of Works, in the middle, or towards the latter half, of the last century. Our volumes for 1841, 1850, 1860, and 1862 contain numerous references to this Vine.

EXCURSION.—The *employés* of Messrs. Wm. CUTBUSH & SON, of Highgate, London, N., and Barnett, Herts, made their annual excursion on Saturday, August 19, on which occasion they went to Hastings, where a very enjoyable day was spent.

CANADIAN APPLES.—According to reports printed in the *Canadian Horticulturist*, the Apple crop in Canada is this year very deficient.

RUBUS ARCTICUS.—A delightful little plant for the rockery, of which a specimen has been sent to us by Messrs. VERTEGANS, of Birmingham. It is of dwarf habit, with very slender wiry stems, stalked leaves made up of three leaflets, each roundish, more or less wedge-shaped at the base, crenately toothed at the edge, and crinkled on the surface. The leaves change to a rich ruddy-bronze colour in autumn. The flowers are borne on long slender stalks. The calyx is cup-shaped, with five spreading, lance-shaped sepals, half the length of the stalked, obovate, deep rosy lilac petals; filaments of the stamens white, thickened at the top, and curved inwards when mature, over the pistil. Berries reddish-purple,

FIG. 44.—LILIAM JAPONICUM VAR. ALEXANDREI. (SEE P. 212.)

with an agreeable a flavour, partly acid, partly aromatic, that the birds of the polar regions may well be enried their feast. Sir J. D. HOOKER records the occurrence of this species in the Arctic regions of Europe, Asia, and America, but notes that it is absent from Arctic Greenland and that though Canadian, it is not met with in the United States. It is not known in Switzerland or Central Europe, and though recorded to have been found in the Highlands of Scotland, the record has not been confirmed.

WASP-WHISK.—Mr. A. F. WINCH of Rochdale Road, Oldham, forwards a flat whisk composed of slender stiff rods of cane, very tough and light, so that smart blows can be given on glass windows without injury to the glass. The whisk is very effectual in ridding a room of flies or wasps, and would be serviceable for other purposes.

WEED-KILLER.—Messrs. MARK SMITH & Co., of Louth, have submitted for our inspection and trial some of their "Powder Weed-killer." Considering the very poisonous character of these preparations, and the possibility of alarming results from their abuse by careless workmen, it is an advantage to have the material in the form of a gray powder which has to be dissolved in water before use. Accidents are thus less likely to happen than in the case of a liquid preparation. We have ourselves tried it satisfactorily on a small scale, and have no doubt as to its efficiency for the purposes for which it is designed.

AN OPPORTUNITY TURNED TO ACCOUNT.—We have often pointed out the comparative uselessness of the majority of flower-shows, the results of which are by no means proportionate to the expense and trouble involved in their management. It was, therefore, with very great satisfaction that we noticed an innovation at the recent show of the Beddington, Carskilton, and Wallington Horticultural Society, where, as we learn from the *Gardening World*, Mr. J. WRIGHT gave a most interesting address.

"Having a few good object-lessons on the table before him, Mr. WRIGHT dwelt briefly on judging by quality rather than mere size, illustrating his point with samples of Vegetable Marrows taken from the 1st, 2nd, and 3rd prize lots, the 1st prize being fair-sized examples, tender, and good for cooking; the 2nd larger and harder skinned; while the 3rd were very large and hard-skinned. His next illustration was a Potato plant, grown with a single stem, strong and robust, with a splendid crop of fine tubers. Then he showed a plant with several stems, all weak, and with a miserable worthless lot of tubers. This was to show the superiority of high cultivation over ordinary and careless methods. Then taking up samples of Apples, he again illustrated the economy of high over poor cultivation, by showing that the crowded small fruits were not only worthless, but owing to the fact of their taking a much larger percentage of mineral constituents from the soil than good marketable fruits do, they actually cost more to produce."

The amount of mineral matter, however, removed is so slight that we apprehend it would not be noticeable commercially. Another interesting feature of this show, to which we have already referred, was the competition for the best dinner for five persons—a working-man, his wife, and three children, the dinner to include at least two vegetables, the value of each dish to be stated, and the whole not to exceed 2s.

"This novel class," says our contemporary, "brought out a strong competition, and the various 'spreads' were judged by points, the following being the maximum scale:—Soup, eight; fish, eight; entrées, ten; roast or boiled meat, pudding or pie; ten; vegetables, twelve; sweets, six; fruit-pudding or pastry, six; savoury or cheese, six; bread, four; salad, four; sufficiency, four; cost, six; and skill in preparation, twelve; or a grand total of ninety-eight points. The first prize was won by Mrs. SPAVENS with fifty-four points. This exhibitor put the cost of her dinner at 2s., and for this sum she provided soup, pressed beef, Scarlet Runner Beans, custard, Potatos, Plum tart, and bread. These with the exception of the Potatos, could hardly be beaten so excellent were all the other dishes in quality. The beef was garnished with Parsley and Beet cut in thin slices, and with the exception named these viands were fit to be set before anyone. The second prize went to Mrs. BARR, who had a breast of mutton, Potatos, cheese, bread, rizine milk pudding, Apple tart, bread-and-butter pudding with Currants, Vegetable Marrow, Lettuce, and extract of herb beer, of the exhibitor's own make. This exhibitor scored fifty-one points, and may be considered a close second, while well ahead of the third prize-winner, Mrs. EVANS, who had sheep's-head, Potatos with white sauce, bread, Scarlet Runner Beans, capon-pudding, and mutton broth with pearl barley. Extra prizes were awarded to Mrs. COLUMBOUSE, whose exhibit consisted of cutlets dished up on rice decorated with cooked Tomatos and sliced Lemon, Potatos, bread, and five

Apple dumplings; and to Mrs. E. DAVIS, who had stewed beef with Carrots, Cabbage, Potatos, bread, and plum pudding, the whole costing 1s. 6½. Mr. SNEE himself set up a table on which each article was most daintily dished up, and included cheese, butter, mackerel, meat pie, bread, Scarlet Runner Beans, and Potatos, the total cost of which was 1s. 9½. The table was set off with flowers, and the viands calculated to tempt the most fastidious appetite, and the whole served as an object-lesson of first-rate importance."

Next year we would suggest that a very much larger proportionate number of marks be given to skill in preparation. At least, half the number of marks should be allotted to the cook.

FLOWERS IN SEASON.—Messrs. R. H. VERTEGANS & Co., of Chad Valley Nurseries, Birmingham, send the following:—We enclose blooms of a variety of *Coreopsis*, received by us under the name of *C. monstrosa*. We do not think it is in general cultivation, but if it were well known, it would, we doubt not, soon become a most popular plant. It grows to the height of about 18 inches, and produces its flowers in great abundance, and you will see the colour is a distinct delicate shade of rich golden-yellow, merging into orange. A covering of some light material, or coke-ashes, was found sufficient to protect them through the past winter. [It is *C. grandiflora*. En.] We also enclose a few sprays of a dwarf-growing *Michaelmas Daisy*; the flowers are pure white, and the small ones are produced in great abundance. We have received it under the name of *Aster ptarmicoides*. You will also find a few sprays of *Rhodotypos kerrioides*. Its delicate white flowers are produced on the tips of the branches continuously through the season, and will be found a very useful hardy flowering shrub [Suitable for town gardens; the fruit is also interesting. Ed.] A bed of *Statice sinuata* having been much admired, we enclose a few sprays. It can be raised readily every year from seed, and should receive much the same treatment as Stocks, Asters, &c. [Very pretty and varied in colour.]

HOME CORRESPONDENCE.

MARKET SALESMEN'S PRICES.—A word of caution to fruit-tree planters: take the advice of the writer and refrain from planting—do not be led away by agitators who advise you to plant for profit. If you do, you will bring trouble and vexation to yourself, and also an empty pocket. I quote in full the items of a small consignment of fruit sent to Covent Garden, July 29 and 31, viz.:—48 Peaches, 6s. per dozen, 2s.; 18 dozen Golden Gage Plums, 2s.; 9½ half-bushels Apples, 6d., 4s. 6d.; 36 Peaches, 4d. per dozen, 1s.; 48 Peaches, 4d. per dozen, 1s. 4d.; 40 Washington Plums, wall fruits, 1s.; 45 do., do., 1s. I may here state that the Peaches were not large, about 8 inches in circumference, some larger, all indoor fruit; the Apples were all hand-picked and selected, and the Plums all sorted, and wrapped, singly, in tissue-paper—these were very fine. Now, after deducting all expenses, carriage of empties and full price of tissue-paper, wadding, cotton-wool, time of picking, packing, selecting, salesman's commission, tolls, &c., the question arises how much out of pocket I shall be by the consignment? Certainly something considerable. Now, in the face of such absurd prices, is it not a folly to continue to plant fruit trees by the tens of thousands, for just a few to benefit by the transaction. We want a remedy, and a full control over the market; we are now in the hands of the salesman, we never see his books, returns do not come to hand for many days, possibly weeks, after goods are sold, and we positively know nothing further than that we have consigned our goods and we must wait and accept the miserable sum (if any) forwarded by the salesman. Looking at things in this light with regard to prices, one would really imagine shopkeepers must be making a fortune, that is, if they actually buy at these prices. If so, do the shopkeepers ask too high a price for their goods, that prevent a larger demand by the public? if they buy 8-inch Peaches at 4d. per dozen, surely they can be sold for 2s. per dozen, or even less, instead of the high prices we see marked up in the windows, which prevent people from indulging in a good Peach or Plum, and these low prices would increase the sale enormous and leave a good margin for quick returns. And again, hand-picked Apples at 1s. per bushel, ought to be

in everybody's reach. I must confess, being both a buyer and a seller, that there is an immense difference between the two occasionally. When running short, I have to buy goods not so good as my own, but very very far in advance of the prices I have received. I have a neighbour who is in a large way of business, and who attends Covent Garden Market regularly, but he tells me he is not lucky enough to buy at these uncommonly low prices, and is quite content to give 3s. per dozen for such Peaches as I received 4d. per dozen for in London. It would be read with much interest, I have no doubt, if senders would state in these columns the different amounts they have at times received for their Covent Garden consignments. *Alpha, an Old Contributor*. [Our correspondent has had large experience both as a private gardener and as a grower for market. Ed.]

FRUIT AND PROFITS.—There can be little doubt but that for every penny of profit which fruit-growers secure in such a plentiful season as is the present, the dealer, be he salesman, merchant, or mere retailer, obtains threepence. That is rather hard lines for the poor grower, but it is too frequently—especially where fruit is abundant—his share of the products of sale. Few persons, perhaps, would be so much surprised as the growers themselves, had they time and inclination to follow their own fruit from the market to the shop, and then see how far the retail price differs from that which he obtained. Perhaps the grower is his own salesman, and if so, he does rather better than does the unfortunate who entrusts the disposal of his fruit to others. But if he has obtained 3s. per bushel, he will find that it is retailed at from 10s. 6d. to 12s. per bushel. What wonder is it that with such a tremendous bulk of fruit in the market the public obtain so little advantage in the matter of cheapness? Were I about to start in life, it would not, under present conditions, be as a fruit-grower; that is a vocation like to that of a client in law, who exists that others may fatten. The grower produces, the dealer and the salesman grow rich on his productions. It all comes of our present absurd and vicious system of converging all of our fruit products to one centre, where the competition is of the keenest, and then having to return it to the consumers in myriads of ways, and through a few middlemen, so that the ultimate cost is enormously enhanced. Within some 3 or 4 miles of here there was a tremendous crop of Williams' Bon Chrétien Pears; they were sold on the trees at about 3s. per bushel. When I want to purchase a few at a shop, I am asked to pay 6d. for nine similar fruits, or at the rate of 12s. per bushel, and all because these Pears had been sent to Covent Garden to be sold a second time, and then brought back to Kingston to be sold retail a third time. That is how English people trade in fruit. *A. D.*

FURTHER NOTES ABOUT VICTORIA REGIA.—The story of the Victoria from its discovery to its introduction, and its behaviour under cultivation up to the present time, is a long one—too long, I fear, to be told in a note such as the Editor prefers to accompany a picture in this paper. I admit it was an oversight to have overlooked the important part played by Sir Joseph (then Mr.) Paxton, at Chatsworth, in the early stages of the introduction of the plant. I am also glad to learn that it is still thought worthy of cultivation at Chatsworth. Mr. Thomas is in error in supposing (see p. 68) that the plant was first flowered in 1840, and that it was then named after our present Queen. It may interest admirers of this glorious Water Lily if I repeat here what Dr. Lindley wrote about it in 1837, when he published an illustrated paper on the Victoria regia from material supplied by the late Sir R. Schomburgk. Lindley's words, written fifty-six years ago, are specially interesting now. He said:—"It is not less my duty than my inclination to concur with its zealous and enterprising discoverer (Schomburgk) in distinguishing by your Majesty's illustrious name by far the most magnificent species in the family of the Nymphs—one of the most noble productions of the vegetable kingdom—first found in your Majesty's South American dominions by a gentleman travelling under the auspices of your Majesty's Government, and our knowledge of which dates from the period of your Majesty's accession to the throne of these realms. That the reign of Queen Victoria may be as much distinguished in the annals of history as the majestic plant henceforward to bear that royal name is pre-eminent in the flora of its native country, is the earnest prayer of . . ."

J. Lindley, Professor of Botany in University College, London, October, 1837." Lindley's prayer has been answered, for Victoria the Queen and Victoria the Nymph are still with us great, glorious, and distinguished, both of them. When Schomburgk sent his specimens and drawings to England, he proposed that the plant should be called *Nymphaea Victoria*, believing it to be a species of *Nymphaea*, but Lindley found after examining the specimens that it was a new and well-marked genus, and therefore proposed its present name. It was not till twelve years after this that the plant was introduced to Kew by means of seeds forwarded from Demerara, from which plants were raised and distributed, one going to Chatsworth and another to Syon. The seeds were received in February, 1849, and in November of the same year the Chatsworth plant flowered. It was soon after flowered at Syon and Kew. Paxton watched the development of his plant with keen interest, as is shown by the interesting account of it which he wrote for Sir William Hooker, who published it along with a series of magnificent pictures by Fitch, and a full history of the plant by himself, in an imperial folio book, entitled *Victoria Regia*. Paxton kept his plant through the winter of 1849-50. In exactly a year from the opening of the first flower (November 5, 1849), it had produced 150 leaves and 126 flowers. Some of the latter were removed in bud, with a view to strengthening the plant. I should like to be able to say, in answer to the remarks of "Vic" (p. 68), that no one who has grown a healthy, vigorous *Victoria* can have failed to observe that the rim of the leaf remains turned up long after the leaf has matured, and, indeed, until the leaf begins to fade and decay. Weak plants, however, do not produce these deep-rimmed leaves, the blade lying quite flat on the water. I send a photograph which shows a plant with at least sixteen full-sized leaves, every one of which has a well turned-up rim. Whether the rim serves the purpose of keeping aquatic animals from damaging the leaf by climbing on to it (by-the-by, it would not prevent birds from landing upon the leaf), or whether it is, as some suppose, to keep the leaves from overlapping each other, are hypotheses which may be taken for what they are worth. It requires no microscope to see the perforations in the leaf. Singularly enough, Sir W. Hooker looked upon and described them as stomata. If "Vic" is ever in a garden where there is a full-sized, rimmed, healthy leaf of *Victoria*, he can easily see for himself the part these perforations play in getting rid of water from the surface of the leaf. It cannot get over the rim, nor will the evaporation theory "wash." The photograph herewith sent will convince him that the leaf-stalk must elongate very considerably after the blade has matured, i.e., grown to full-size. The photographs also show that three good-sized children in one case (I stated from memory that they were from ten to fourteen years of age; I now learn that they were from five to ten years of age), and a 6-foot man in another, were supported by the floating-leaves of a *Victoria regia* in the Botanical Garden at Rotterdam. The *Victoria* at Kew is in fine condition this year. W. W. [A full account, with figures of the Chatsworth plant, is given in our volume for 1849, pp. 740, 742. Ed.]

INCIDENTS OF THE SEASON.—In Ravenscourt Park, Hammersmith, a Horse-Chestnut tree is to be seen in blossom. About a month ago the leaves came off the upper portion of the tree; the abnormally hot weather since then has induced it to make a second growth, which has produced a quantity of blossom. The tree now presents a very unusual appearance, the upper part being clothed with pale green foliage and blossom, whereas the lower part still retains its old leaves. W. B. G.

A LARGE APPLE.—This morning a specimen of Peasgood's Nonsuch Apple was forwarded to me which had grown in the Maidstone district weighing 26 oz.; the fruit is handsome. It is quite possible that larger specimens have been grown during this exceptional season or prior to it, but it may interest your readers to know of this unusually large Apple. A very fine dish of twelve of this same variety was exhibited last week at the Hastings annual flower show. James Lake, London Road, St. Leonard's.

RATING GREENHOUSES.—In your "Answers to Correspondents" last week, p. 224, you mention the Worthing Case, and for further particulars refer "E. B." to the Nursery and Seed Trade Association, perhaps under the impression that the case was conducted by that Association. The Worthing Case

was fought entirely by the Market Gardeners', Nurserymen and Farmers' Association, of 32, King Street, Covent Garden, Sec., H. B. Ball, Esq. I know that at the time the Nursery and Seed Trade Association printed a full account of the case in their report, without mentioning which Association did the fighting; perhaps that is the cause of the error. This is not the first time I have observed it. W. Poupert, Marsh Fara, Twickenham.

ROYAL HORTICULTURAL SOCIETY.—An inspection has been lately made of an admirable trial of Onions at Chiswick, of some fifty rows, and of about forty-five so-called diverse sorts. Of necessity there is between them many very trifling differences, but that some have undoubted high merits, as presented by the trial, there could be no doubt. Some varieties that have obtained very great popularity as exhibition sorts, when grown under the forcing conditions, now so commonly applied to them, were here of no very special merit, and some especially showed want of correctness to character, some bulbs being flat, others globular, and even differing occasionally in colour. That sort of sportiveness is very characteristic of all Onions, but is particularly so of new ones. We understand that the committee who made an inspection finally selected and awarded three marks to Southport Yellow Globe, a fine globular variety, handsome, and even; and Southport Red Globe, almost a duplicate of the other, but the finest red Onion in the collection. Seed of these came from Mr. Deverill of Banbury, and Henderson of New York, and they are American varieties. A Southport White Globe, very handsome, is a bad keeper. Suttons' AI was, we learn, also awarded three marks; this is a very fine flattish globular and handsome bulb, showing a capital sample. Deverill's Coconut is the very best at Chiswick of all the deep globe-shaped Onions, giving a first-rate sample of its section, hard, clean, and keeping well. Henderson's Prizetaker, a fine clean, handsome, globular bulb, was also a capital sample in the row; Globe Madeira, Vilmorin, the finest of all the varieties; and Italian Tripoli, the finest and best of the white-skinned section. As many of the varieties have been sown again to stand the winter, a further interesting trial may be looked for next summer. The present one has been for the season of unexpected excellence. Potatos, of which there is again an extensive trial, were next taken. Many of these showed no special merit, others were late, and will have to be seen again. The following were selected for the award of three marks, Suttons' Windsor Castle and Triumph, both high-class, handsome white, round, early Regent, stock from Messrs. Veitch & Sons; Jeannie Deans, flat, white, round; Lillie Langtry, red, round; and Red-Cliffe Kidney, flattish white. All these, and indeed several others, were splendid croppers, giving handsome tubers, but some did not satisfactorily pass the cooked ordeal. It is but fair to say, that at Chiswick, Potatos are cooked remarkably well, and this year the tubers are exceptionally clean and good. It is, indeed, an unusual feature that of so many varieties and roots lifted for inspection, not a single speck of disease should have been seen, and many late sorts have the haulm in the most vigorous condition. This is certainly remarkable for Chiswick, so near to the end of August. Correspondent.

JUDGING AT FLOWER SHOWS.—At the Cardiff Flower Show last year I had occasion to blame the judges for giving the 1st prize in a class for a collection of cut flowers of hardy herbaceous perennials, twelve bunches distinct varieties, to a collection which contained Roses, Hydrangeas, and some other woody plants; and this year I have again reason to find fault with the judges for disqualifying a collection of "cut flowers, twelve bunches (exotics) distinct varieties," for containing a bunch of *Anemone japonica alba*. *Anemone japonica alba*—if I mistake not—was introduced from Japan by Fortune, and is not indigenous to this country, and therefore must be an exotic to all intents. If the wording of the schedule had been tropical exotics, I could have understood their decision, but as it is, I am surprised at the judges showing such a lack of knowledge of our English etymology. A. Pettigrew, Castle Gardens, Cardiff.

CEREUS GRANDIFLORUS (see p. 186).—As most of the *Cereus* grow in the Riviera gardens, and flower as freely as in their native habitat, I have had the opportunity of noticing the different kinds of insects which are probably the medium of fertilising their flowers. The plants, when growing in a somewhat shady position, do not entirely close their flowers during the day, and there is always sufficient room

for bees, which are the medium of fertilisation, to enter; but these insects do not seem to attack them until late in the evening, when the flowers commence to open, and transmit their odour. Then they may be seen swarming around the flowers; they become benighted, and perforce are obliged to remain in the flower all night. I have counted as many as seven prisoners in one flower. Another medium is a very large hawk-moth, which may be seen hovering around them in the evening. The moth is probably one of the order of Sphingidae, but certainly not a British species. Ants, too, swarm about the flower during the day for the nectar; but for all these means, they do not fertilise freely, as out of several attempts to cross-fertilise them with other species, I have, at present, only obtained one. *C. peruvianus* and *C. serpentinus* fertilise quite freely artificially, but they do not fertilise themselves. The former species is at this time of the year a very fine sight, with growths 20 feet in height, and studded with flowers and buds from base to summit. Riviere.

A TREE POINSETTIA.—On the back wall of a house at Seaham Hall, in Durham, is a *Poinsettia* which covers a space of 11 yards by 8. This plant has all the appearance of a tree, the stem at the bottom measuring 10 inches in circumference, and many of the branches being almost as thick. The leaves are much larger than most of those seen in pots, and of a deeper green. It is the picture of health, and shows no signs of old age or decay. Mr. Draper informed me that he has 400 heads of bracts from it during the season. Nagahod.

COLOUR OF MICHAELMAS DAISIES.—The hot sunny weather is producing a remarkable effect on the colour of some of the Michaelmas Daisies. Mr. Hartland, of Cork, wrote to me to say that the variety known as Harpur Crewe, which generally opens pure white, is this season pale lilac; and on looking at my own plants, I find the colour of the few open flowers the same. Other Michaelmas Daisies are so different from their normal colour, that I have spudded up several under the belief that the labels had been wrongly placed. I now believe that the abnormal season has caused a change of colour in them. C. Wolley Dod, Edge Hall, Malpas.

BEDDING BEGONIAS.—In the Chiswick Gardens, two of the best beds of flowers are comprised respectively of the varieties *Crimson Gem* and *Duchess of Edinburgh*, both of the *B. semperflorens* type. The former of the two is very striking, especially so this year, when tuberous Begonias have, in a large measure, failed. The plants make a very dense growth, and the bronze-chocolate leaves are in contrast to the profusion of crimson flowers; it is one of the most effective beds I have seen this season. The variety *Duchess of Edinburgh* is distinct. This is vigorous in growth, broad in the leaf, and quite of a polished green colour. The flowers, which are produced freely, are white tinged with pink. There is a future for the varieties of *B. semperflorens*, and they certainly make excellent bedders in all seasons. F.

SOCIETIES.

ROYAL SCOTTISH AGRICULTURAL.

(Continued from p. 214.)

In spite of late hours, the party were early astir on the following (Wednesday) morning, visiting St. George's Chapel and the Albert Memorial Chapel, and being grouped for a photograph before the start on their 7-mile drive to Cliveden.

Cliveden.—Passing through Eton and Burnham the spot was soon reached, and after admiring some fine specimen Conifers, the party were received on the terrace by the Duke of Westminster, who cordially invited them to go over his grounds. After several distinct views of what are, perhaps, the most lovely scenes in England—wooded slope, winding river, wide meadows, and distant tree-clad hills—they descended to the river-bank, where ancient Yews are festooned with Clematis, and cling with gnarled roots to the chalk, which here is bare of soil. Some fine Alders, over 6 feet round, overhung the stream, and near the boathouse, a Tulip-tree, about 105 feet in height was taped as 9 feet 4 inches in girth.

Dropmore.—In this 800 acres are probably the finest named and dated collection of Conifers in the world, though the oldest of them, a Lebanon Cedar, now 13 feet 7 inches in girth, dates only from 1792. Among the many well-known and oft-described

specimens, attention was specially drawn to the *Abies nobilis*, planted in 1835, now 76 feet in height, and 7 feet 5 inches in girth; the many fine trees dating from 1839, including *Pinus insignis*, now 90 feet high, and 10 feet 10 inches in girth; those of 1843, including *Picea Morinda*, 61 feet in height, and *Abies cephalonica*, 71 feet; and those of 1861, including *A. Albertiana*, 58 feet, and *A. grandis*, 64 feet high. Of course, the great Chilian Pine, *Araucaria imbricata*, planted in 1830, now 69 feet high, and 8 feet 3 inches in girth, and still more, the Douglas Fir of the same age, now 110 feet high, and over 11 feet in girth, were objects of universal interest to the party, and but little attention could be spared for aught else but Conifers. A fine plant of *Erythrina crista-galli*, and the practically wild condition of *Impatiens parviflora*, did not, however, escape notice.

Burnham Beeches.—A few minutes' drive from the stables of Dropmore, brought us into Burnham Beeches, 374 acres purchased in 1879 by the Corpo-

FIG. 45.—QUEEN ELIZABETH'S OAK, WINDSOR.

(See Report of Scottish Arboricultural Society.)

ration of London as a pleasure-resort for the people of the great city, which lies some twenty-five miles to the eastward. Here a welcome al-fresco lunch had been provided by Mr. Harry Veitch, who lives near-by; and here, too, under the picturesque old pollards, we were met by the forester, Mr. Forbes, who led the way through the property. Divers were the opinions expressed, one enthusiast even advocating the entire removal of the "monstrous deformities," and the replanting of the area on economical principles with Scots Fir! Most of us, however, recognised the importance of purely æsthetic considerations, though it is not perhaps agreed, as has been supposed, that the process of pollarding actually adds to the longevity of a tree. The return drive near Stoke Pogis enabled some of the visitors to see the scene of Gray's immortal Elogy, and then, after a hurried tea at Windsor, a special train conveyed us to Southampton, where a display of summer lightning, unequalled for many years, and but seldom seen in the north, seemed to have been prepared for our delectation. [Numerous views of Windsor, Cliveden, and Dropmore have been given from time to time in our columns, and in view of the special interest attaching to them, we now give views of two of the famous Oaks at Windsor. ED.]

(To be continued.)

WELSHPOOL HORTICULTURAL.

August 10.—The old Society came to an end about four years since, but through the exertions of the present enterprising Mayor, E. O. Jones, Esq., and a few others, it was determined to resuscitate it, and accordingly a new committee was formed and a fresh secretary appointed. The committee having enlisted the services of W. Forrester Addie, Esq., agent to the Earl of Powis, as Secretary, through him received permission from the Earl of Powis to hold the show in the Deer Park of about 700 acres, and also to open the gardens and terraces to the public, an attraction of itself sufficient to secure its success, and when we say nearly 8000 people visited the show, it appears at once how the public appreciated the kindness of the Earl of Powis. The committee have a good balance of £100 or more. The gentry of the neighbourhood assisted in sending plants, flowers, and fruit; these, with the fine display of cottagers' produce, made a good show.

Messrs. Cutbush & Son of London sent a nice col-

CARDIFF HORTICULTURAL.

August 15, 16.—The fifth annual show was held in the Sophia Gardens on the above date. The great heat, though not interfering much with the enjoyment of the visitors—thanks to the shade of the number of large trees in the gardens—affected the exhibits of cut flowers very seriously, many of the Roses, Dahlias, and Begonias collapsing early in the afternoon of the first day.

The quality of the exhibits was highly satisfactory, and the competition so close in some cases, that the judges had no alternative but to award equal prizes. That this has been a warm sunny season could easily be seen by the many samples of ripe, highly-coloured fruit exhibited, which appear to indicate that Apples, Pears, Plums, and Peaches are of very good quality in this district, notwithstanding the long drought. The Grapes shown were also of good quality. Vegetables were well represented both in the open and cottagers classes.

Cut Flowers.—For twelve hybrid perpetual Roses, named varieties, three blooms of each, Mr. R. Crossling, of Penarth Nurseries, took 1st prize; Duke of Wellington, Duchess of Bedford, Fisher Holmes, Lord Bacon, and Mary Fitzwilliam were prominent in this collection. S. P. Budd, Esq., of Bath, was 2nd.

Mr. S. Treeder, Pwll-coch Nurseries, Cardiff, was a good 1st, for twelve varieties of Tea Roses, three of each variety. Some of the best blooms were Marie Van Houtte, Francisca Krüger, Hon. Edith Giffard, and Perle des Jardins. S. P. Budd, Esq., was again 2nd.

Messrs. Keynes, Williams & Co. took the 1st place in the competition for twenty-four distinct varieties of H.P. Roses; and S. P. Budd Esq., was 2nd.

Mr. S. Treeder was again 1st, for eighteen distinct varieties of Tea Roses, the varieties being much the same as those shown by him in the larger collection. S. P. Budd, Esq., again closely following, took the 2nd prize.

Geo. Humphries, Esq., of Chippenham, was awarded 1st prize for a collection of twenty-four distinct varieties of Dahlias; and Messrs. Keynes, Williams, & Co., Salisbury, were placed 1st in the class for Cactus Dahlias.

The best collection of twelve bunches of hardy herbaceous flowers was exhibited by T. Every, Esq., of Bath. J. Tout, Esq., Llanblethian, took 1st; and G. Shrewing, Esq., 2nd, for Gladioli.

For placing *Anemone japonica* in a collection of twelve bunches of exotic flowers, the Marquis of Bute, the only exhibitor in this class, was disqualified by the judges!

Plants.—In the collection of twelve stove and greenhouse plants in bloom, Mr. J. Cypher, Cheltenham, took foremost place, with well-grown specimens of *Ixora Williamsi*, *Statice profusa*, *Erica Turnbulli*, *Anthurium Andreanum*, *Allamanda nobilis*, *Bougainvillea glabra*, &c. Messrs. Heath & Son, Cheltenham, were 2nd with a very good collection.

Mr. J. Cypher took the lead for eight fine foliage plants, distinct varieties, and Messrs. Heath & Son, were 2nd. Both collections consisted mostly of large specimen Crotons and Palms.

Mr. J. Hillyard, Cardiff, an amateur, was 1st for six specimen Fuchsias, and was also awarded a special prize for the same, as representing the best cultural skill in the show.

Colonel Sir E. S. Hill of Llandaff (gr., Mr. Clark) exhibited eight distinct varieties of exotic Ferns, for which he obtained 1st prize, and was also as successful in exhibiting four stove and greenhouse plants in bloom.

For a group of plants, arranged for effect, occupying a space of 100 square feet, Colonel C. H. Page, Llandaff (gr., Mr. W. Hockey), was 1st; and Mr. Case, of Rumney, 2nd prize. Colonel Sir E. S. Hill was placed 1st for a group occupying 50 square feet arranged for effect.

C. Jenkins, Esq., Penylan, Cardiff (gr., Mr. Thos. Malpas), obtained 1st prize for a collection of six distinct varieties of Caladiums. For a single specimen of a stove or greenhouse plant in flower, the Marquis of Bute was awarded 1st place for a good specimen of *Souvenir de Charles Turner* Pelargonium.

Fruit.—M. Biddulph, Esq., Ladbury Park (gr., Mr. Davies), was placed 1st for a collection of six bunches of Grapes, not less than three distinct varieties. Black Hamburgh, Muscat of Alexandria, and Gros Maroc were the varieties exhibited. The same gentleman carried off 1st prizes for three bunches of Muscat of Alexandria, three bunches of Black Alicante, and three bunches of Gros Maroc. F. M. Franklen, Esq., St. Hilary, obtained 1st prizes

lection, including several new plants, Mr. Murrell of Shrewsbury showed very fine Gladioli and Roses. Messrs. Prichard of Shrewsbury had a fine stand of plants and flowers. Messrs. Jones & Sons of Shrewsbury filled a big space with bouquets, wreaths, plants, and cut flowers; and Mr. Porter of Oswestry, and Messrs. Evans & Sons of Llanymenash showed good groups of plants and fruit. From Mrs. Naylor, Leighton Hall, came a large group of flowering and foliage plants; and from Mrs. Curling, The Brooklands, two groups of stove and greenhouse plants, showing good cultivation; Mrs. Lovel, Llanychydol, having a nice group of plants.

Groups of plants were arranged in the centre of the tents, with side tables having projections at intervals, was a pleasing variation from the old plan of arranging seen at most shows. One of these long cross tables was filled with choice fruit from his lordship's three gardens in Montgomeryshire, including some finely-coloured Grapes on pot Vines, trained along the top of the table, having a nice effect among the groups of plants.

Herbaceous flowers were well shown by Messrs. Dicksons of Chester, and several other gentlemen.

A class was provided for field grasses and flowers to be named, and this brought out a very good competition among young farmers of the district.

for three bunches of Black Hamburg, three bunches of Foster's Seedling, and three bunches of Pearson's Golden Queen. V. Stuckey, Esq., took a 1st prize for a single bunch of Black Hamburg, the Marquis of Bute for a single bunch of Muscat of Alexandria, and the Earl of Cork for one bunch of Foster's Seedling.

The Marquis of Bute secured all the leading prizes for Melons and Pine-apples.

With a collection of Grapes, Peaches, Melons, Nectarines, and Plums, M. Biddulph, Esq., took 1st place for the best six dishes of dessert fruit, and V. Stuckey, Esq., 2nd.

Three 1st prizes were awarded to the English Fruit and Rose Company of Hereford for a collection of six dishes of dessert Apples, six dishes of culinary Apples, and for one dish of dessert Apple.

Col. Gaskell, Caerleon, took 1st prize for a dish of Cherries, and 1st for a dish of Black Currants.

Vegetables.—The principal prize-takers for vege-

entries. Mr. Thomas Wilkins, gr. to Lady Theodora Guest, Inwood House, Shaftesbury, led the way with a good lot.

With six exotic Ferns, Mr. Wilkins was easily 1st, staging good healthy-looking plants of *Cyathea medullaris*, a grand *Adiantum Farleyense*, *A. cuneatum*, *Davallia Mooreana*, *Thamnopteris nidus avis*, and *Gymnogramma Wettenthaliana*.

Mr. Bedford, Harnham Nursery, Salisbury, had the best half-dozen Fuchsias, showing fairly well-flowered pyramidally-trained plants.

Mr. Arthur Robey, gr. to Captain Greenwood, Harnham Cliff, Salisbury, was well 1st for Begonias (tuberous-rooted); his plants were fresh, sturdy, and well grown, the flowers being large, well formed, and of distinct shades of colour.

Groups of miscellaneous plants arranged for effect, in a semicircle 12 feet in diameter, are always a feature at this exhibition. Mr. Willes was 1st, for a light and tastefully-arranged group of Crotons,

Brunswick Figs of good size and colour, Blenheim Orange Melon, large and well-coloured Williams Bon Chrétien Pears, white Magnum Bonum Plums, and Pine-apple Nectarine, the latter the only weak dish in the collection; Mr. A. Crossman, gr. to J. Brutton, Esq., Yeovil, was a good 2nd.

Grapes were shown extensively and well, Mr. Ward was a good 1st for three bunches of White Muscata, being also well ahead in the class for any other white than Muscat of Alexandria, staging neat and well-coloured bunches of Golden Queen, fine in berry and finish; Mr. Warden being a capital 2nd, with Buckland Sweetwater, fine in every respect. Mr. Chalk, gr. to George Reid, Esq., Westwood, Salisbury, was 1st in a class for three bunches of Black Hamburg; and Mr. Warden was a dangerously-close 2nd. The last-mentioned exhibitor was a long way ahead in the class for any other Black Grape, showing handsome bunches of Muscat Hamburg, such fine bunches in size and colour as are seldom met with.

Pines were not extensively shown. Mr. Crossman was 1st with a medium-sized Queen, having well-developed and brightly-coloured pips.

Fourteen Melons were shown, a variety named County Councillor securing 1st prize for the exhibitor, Mr. Palmer, Andover.

Peaches and Nectarines made a pretty good show. Mr. Wilkins was 1st for the former with Sea Eagle, and Mr. Chalk occupied a like position for the latter, showing good fruits of Pine-apple.

Apples and Pears.—Mr. F. Smith, gr. to the Bishop of Salisbury, was 1st for three dishes of dessert Apples, staging nice, clean, even, bright-coloured fruits of Worcester Pearman, Mahbott's Pearmain, and Celine. Mr. Wilkins was accorded a similar honour for culinary varieties, showing large clean fruits of Blenheim Orange, Lord Suffield, and Peasgood's Nonsuch. Mr. Hughes was 1st for four dishes of Pears, Dr. W. D. Wilkes, The Canal, Salisbury, securing a like honour in the amateurs' classes for three dishes of Pears, with grand fruits of Pitmaster Duchess, Glou Morceau, and Williams' Bon Chrétien.

Vegetables.—Three collections of twelve kinds were shown in fine condition in the open class by Mr. Wilkins, who was a good 1st. The collection contained grand examples of Favourite Onion, Autumn Giant Cauliflower, Satisfaction Potato, Stratagem Pea, New Intermediate Carrot, &c.

Cut Flowers were shown in large quantities and well. Dr. D. Seaton, Rutland Lodge, Bitterne, was 1st for twenty-four Roses, distinct varieties, with good blooms. Mr. Evans, gr. to Lady Ashburton, Melchet Court, Romsey, obtaining a like distinction for a dozen blooms; and Mr. Budd was to the front for eighteen bunches of cut flowers, distinct, staging a choice lot.

Miscellaneous exhibits made a show in themselves. Messrs. Keynes, Williams, & Co., Salisbury, had an arrangement of five pyramids of Dahlias on the staging, filling in between with choice Roses, pieces of rough cork being introduced into the edging with good effect, which, when contrasted with the foreground artistic combination of plants, Roses, water, and Ferns, was very telling.

Messrs. Robert Veitch & Son, Exeter, had a grand display of herbaceous and alpine plants and flowers in great variety; also a fine assortment of Apples. Mr. Ladhams, of Shirley, also put up a fine lot of herbaceous plants and flowers.

READING HORTICULTURAL.

August 16.—Like some other societies, the old established one at Reading has had its reverse, and instead of holding two shows as formerly, it now holds but one each year; and on this occasion the committee were able to occupy their old position within the Abbey ruins, they having succeeded in renewing the large tent which was blown to pieces two or three years ago. There is one disadvantage attending such a site: that it requires a larger number of plants to fill it; and on the above date certain entries of plants were not forthcoming on the morning of the show day, which caused serious gaps in the arrangements, and materially affected the display. The simple act of courtesy, of sending a postcard on the previous day, would prevent a great deal of justifiable irritation.

Plants fell below their usual number. Mr. J. F. Mould, nurseryman, Pewsey, had a very good group of six plants, including a fine example of *Erica Eweriana*, which was the subject of much admiration. Mr. Mould was also the only exhibitor of six foliated plants, taking the 1st prizes in each class.

FIG. 46.—WILLIAM THE CONQUEROR'S OAK, WINDSOR.
(See Report of Scottish Arboricultural Society.)

tables were G. Shewring, Esq., Llaodaff (1st for the collection); W. Moore, Esq., Wenvoe; W. W. Nell, Wenvoe; T. Richards, Esq., Sulley; and G. Garraway, Esq., of Bath.

WILTS HORTICULTURAL.

AUGUST 16.—The Wilts Horticultural Society held its annual show in Wilton Park on the above date, the weather being good. Lord Pembroke kindly granted permission for visitors to the show to view the beautiful grounds and flower gardens surrounding Wilton House. The attendance was good, and Mr. W. B. Williams, the energetic Hon. Secretary, is to be congratulated upon the success.

Plants (open).—Three good collections of twelve stove and greenhouse plants, six foliage and six flowering, were put up by Mr. Finch, gr. to J. Marriott, Esq., Queen's Road, Coventry; Mr. Willes, Winchester Road, Shirley; and Mr. Peel, gr. to Miss Todd, Sidford Lodge, Shirley, by whom the prizes were won in that order. Mr. Finch staged a good all-round dozen plants, including *Ixora Frazeri*, *Dipladenia Thomas Speed*, *Erica Marnockiana*, *Kentia Fosteriana*, *Cycas circinalis*, *Croton Queen Victoria* and *C. Mortii*, &c.

In the class for nine stove and greenhouse plants, four in flower and five foliage, there were three

Celosias, *Ixoras*, *Bridal Wreath* (*Francoa ramosa*), &c., set in a groundwork of *Adiantum cuneatum*, with graceful Palms in the back, and the whole edged with *Panicum variegatum*.

Mr. Wilkins was a good 1st in the group confined to gentlemen's gardeners, and arranged in a semicircle of 10 feet in diameter. An edging of dwarf variegated grass and *Caladium argyrites* told well in this arrangement.

In the class confined to amateurs residing within a radius of six miles of Salisbury, Mr. Frank Pearce, High Street, Salisbury, was the winner of a Silver Cup value £5, for a group of plants arranged in a semi-circle 10 feet in diameter; and Mr. Hinxman, gr. to H. C. Gregory, Esq., the Island, Salisbury, led the way in a class for a group arranged in a space two feet less in diameter than that in the preceding class.

Mr. Robey again took 1st place for Begonias in the amateur class, beating Mr. Hughes, gr. to Wm. Baring, Esq., Norman Court, West Dean.

Fruit, Open Classes.—Fruit was shown well in most of the classes, and was of generally high order.

For a collection of eight kinds (Pine excluded), Mr. H. W. Ward, gr. to the Earl of Radnor, Longford Castle, Salisbury, was well ahead, showing large solid, tapering bunches of Muscat of Alexandria and Black Hamburg Grapes, fine in berry and finish, and carrying a good bloom, large Sea Eagle Peaches,

Stove and greenhouse Ferns were a good feature. Mr. Willis, gr. to H. J. Simonds, Esq., Caversham, took the 1st prize; Mr. Dockerill, gr. to G. W. Palmer, Esq., M.P., Reading, was a good 2nd. Mr. Willis took the 1st prize for three Orchids. Mr. Mould had the best new or rare plant, showing a new variety of *Statiche* raised by Mr. Chapman of Hawkesyard Park. Mr. Dockerill's 1st prize six *Lycopodiums* were perfect, large in size, and beautifully grown. Mr. Bright, gr. to J. B. Karslake, Esq., had three good *Fuchsias*; and Mr. Dockerill some capital specimens of *Lilies* in pots. *Coleus* were in the form of well-grown and coloured bushes; and groups of three *Palms* were finely shown, Mr. Brown, gr. to A. B. Welch-Thornton, Esq., Beanrepaire Park, Basingstoke, taking the 1st prize; Mr. Willis was 2nd, having a very fine *Latania borbonica*.

The best group of plants of large size, arranged for effect, came from Mr. Pope, gr. to J. P. White, Esq., Wargrave; Mr. Bright taking the 2nd prize.

The best small group was staged by Mr. Frost, gr. to W. Palmer, Esq., Westlands; Mr. Coates, gr. to R. Hewett, Esq., St. Mary's Hill, was 2nd.

In the amateurs' division for plants, the leading exhibitors were Messrs. Brown, Mr. Maskell, gr. to J. O. Taylor, Esq., Cravenhurst; and Mr. Wilson, gr. to Mrs. Garland, Lower Redland.

Cut flowers were represented by spikes of *Phloxes* from Messrs. Such of Maidenhead and Cheal & Son of Crawley; *Dahlias* by Messrs. S. Mortimer, Farnham, and J. R. Tranter, Henley; single *Dahlias*, very fine stands, by Messrs. Cheal and Such. Collections of eighteen bunches of cut flowers were finely shown by Mr. Abery and Mr. Such; and twelve bunches by Mr. Howard and Mr. Bright; *Gladioli* by Messrs. Cheal & Sons and Mr. Such. The special prizes offered by Messrs. H. Cannell & Sons, for blooms of double and single *Begonias*, were taken by Mr. Brown. As usual, table decorations, bouquets, &c., were a pleasing feature.

Fruit was extensively shown. The best eight dishes came from Mr. Smith, gr. to R. Ovey, Esq., Badgemore House, Henley; Mr. Maxim, The Gardens, Heckfield Place, was 2nd. With six dishes, Mr. Ashman, gr. to C. T. D. Crews, Esq., Billingbear, was 1st. Mr. Howard had the best three bunches of Black *Hamburgh Grapes*, very finely finished. Mr. Osman, Ottershaw Park Gardens, the best of any other black, staging *Alicante*. Mr. Lane, gr. to Miss J. D. Smith, King's Ride, Ascot, had the best three bunches of *Muscat*, splendidly finished. *Peaches* and *Nectarines* were very fine. Mr. Bowerman, gr. to C. Hoare, Esq., Hackwood Park, taking the 1st prize in both classes. *Figs*, *Plums*, *dessert* and *kitchen Apples*, *Pears*, *Melons*, *Cucumbers*, and miscellaneous collections of fruit were in excellent character also.

Vegetables were scarcely as numerous as usual, but the quality was very fine. Special prizes were offered by Mr. J. Sharpe, Bardsley; Mr. C. Fidler, Reading; Messrs. James Carter & Co., Holborn; and Messrs. E. Webb & Sons, Wordsley; and in every case excellent produce was shown. There were classes also for cottagers.

Miscellaneous collections included a most artistic group of plants, decorations, &c., from Mr. George Phippen, Reading; cut blooms of double and single *Begonias*, and bunches of *Ivy-leaved Pelargonium Beauty of Castle Hill*, from Mr. R. Owen, Castle Hill Nursery, Maidenhead; a group of hardy flowers from Messrs. W. Cutbush & Son, Highgate; fruit and cut flowers from Messrs. Veitch & Son's nursery at Langley; *Melons* from Mr. T. J. Stacey, Caversham; *Tomatos*, *Apples*, &c., from Mr. R. Ballmore, Caversham; *Tomatos* and *Cucumbers* from Mr. G. T. Pontio, Wokingham; very handsome *Cucumbers* from Mr. S. Mortimer, Reading; *Grapes*, &c., from Mr. R. Churchman, Bracknell; *Grapes* and other fruits from Mr. Frank Lees; and some boxes of capital *Roses*, &c., from Mr. C. Turner, Slough.

It should be stated that the prizes in the classes for collections of fruits were given by Messrs. Sutton & Sons, Reading.

HASTINGS HORTICULTURAL AND FLORICULTURAL.

AUGUST 17.—This old established society was favoured with beautiful weather for the annual exhibition, which has not been the case, except in one or two instances, for many years.

For eight varieties of stove and greenhouse plants (open). Mr. Portnell, gr. to Sir A. Lamb, was 1st; and Mr. A. Gadd, gr. to A. Eagles, Esq., 2nd. Mr. Gadd was also 1st for six varieties, being closely

followed by J. Warren, Esq., of Handcross Park, Crawley.

For variegated and ornamental plants, also for exotic Ferns, J. Warren, Esq., was 1st; Mr. E. C. Gilbert, of Springfield Nursery, being a good 2nd in each case. J. Warren, Esq., was 1st for a collection of six specimen plants. For a specimen foliage plant, J. Warren, Esq., and Mr. E. C. Gilbert were 1st and 2nd, this order being reversed for a specimen in bloom.

Roses.—Twenty-four varieties, 1st, Messrs. Woolard & Son; 2nd, G. W. Piper, Uckfield; 3rd, A. Slaughter, Esq., Steyning; the competition being very close. For twelve varieties, Mr. C. M. Carter was 1st.

Dinner table Decorations.—Mrs. Morris and Mrs. Mole were 1st and 2nd respectively. For a group of plants arranged for effect, Mr. E. C. Gilbert and Mr. A. Gadd shared the honours.

Fruit.—For a collection of six dishes, 1st, Mr. T. Portnell, was 1st; Mr. J. Snow, 2nd. Mr. G. Hellman, gr. to Viscount Gage, was 1st for dessert, and Mr. W. Allen, gr. to Lord Brassey, 1st for culinary Apples. For Black *Hamburgh* and *White Grapes*, Mr. F. Crossman, gr. to Captain Dick, was 1st; Mr. J. Snow being a good 1st for any variety of black *Grapes*. For scarlet and green-fleshed *Melons*, the 1st prizes were taken by Mr. S. Golding and Mr. F. Crossman respectively. The best system of packing fruit for parcel-post transit was won by Mr. W. Robinson, gr. to Mrs. Meryon, Rye; Mr. T. J. Mitchell being a good 2nd.

In the amateur classes, for a collection of stove and greenhouse plants, six varieties, Mr. T. Portnell, gr. to Sir A. Lamb, was 1st; Mr. Morris, gr. to C. J. Ebdon, Esq., being 1st for four varieties, and also for ornamental foliage-plants. For a specimen foliage-plant, and also for one in bloom, Mr. T. Portnell was 1st.

Roses.—A. Slaughter, Esq., Steyning, was the principal winner; and Mr. C. M. Carter was 2nd.

The best show and fancy *Dahlias* were from Mr. F. W. Mitchell; and Mr. J. Stedwick was 1st for *Cactus* and *Pompon varieties*, being closely followed in each class by Mr. J. Budgeon.

Mr. J. Snow and Mr. F. Morris were 1st and 2nd for a collection of cut flowers. The competition was keen throughout, hardly any of the 133 classes failing to show competition.

DEVON AND EXETER HORTICULTURAL.

AUGUST 18.—The annual summer exhibition was held on the public grounds of Northhay, Exeter, by the permission of the town council. The entries were not quite so numerous as usual, even though the names of several fresh exhibitors appeared among the competitors. The cut flower classes were tolerably well competed for, and in almost every case excellent stands of flowers were staged. Plants were as usual shown in good form, but limited to a very few competitors. Fruit exhibits were very much below the usual standard, for which no doubt the dry weather has much to answer for. Vegetables were shown in excellent condition. We can only mention a very few of the exhibits.

Plants and Flowers in Pots.—Twelve stove and greenhouse plants, six in flower, and six foliage. 1st, Mr. Rowland, gr. to Colonel Brock (Silver Cup), *Ixora Williamsi*, *Clerodendron Balfourii*, *Allamanda nobilis*, *Rondeletia speciosa*, *Diplandia hybrida*, *Ixora princeps*, *Seaforthia elegans*, *Crotona Andreana* and *Israeli*, *Latania borbonica*, *Kentia Fosteriana*, and *Anthurium Warocqueanum*.

Six stove and greenhouse flowering plants, 1st, Mr. Rowland, with nice fresh pieces of *Ixora Fraseri*, *Bougainvillea glabra*, *Diplandia hybrida*, *Allamanda nobilis*, *Clerodendron Balfourii*, and *Stephanotis floribunda*. Eight stove and greenhouse Ferns, distinct, Mr. Barnes, gr. to Rev. Hamilton-Gell, was placed 1st, with a capital lot, including *Microlepia hirta cristata*, *Nephrolepis exaltata*, *Adiantum cardiochloena*, *cuneatum*, *concinnum latum*, *Neottopteris nidus*, *Davallia fijiensis*, and *Cibotium princeps*.

Miscellaneous group of plants.—Arranged for effect in a space 12 feet by 16 Silver Cup. Mr. Rowland again took 1st, with an exquisite arrangement.

Fruit.—Collection of fruit, ten dishes: 1st, Mr. J. Lloyd, gr. to V. Stuckey, Esq. Collection of fruit, six dishes: 1st, Mr. T. Heath, gr. to Sir W. H. Walrod. Mr. Bull, gr. to General Buller, took 1st for *Pine-apples*. Mr. E. J. Mearles, gr. to W. Gould, Esq., took 1st for *Black Hamburgh Grapes*. Mr. W. Connolly, gr. to J. R. C. Talbot, Esq., took 1st for any other variety (*Muscat of Alexandria*). Mr.

R. Pike, gr. to Rev. H. Clerk, 1st, for *Madrasfield Court Grapes*. Mr. Lloyd took 1st for *Nectarinea*. Mr. W. Davy, gr. to P. Benmore, Esq., 1st, for *Buckland Sweetwater Grapes*. Mr. Martin took 1st for *Melon Green-flesh* and *Morello Cherries*. Mr. Mairs, gr. to Sir J. Shelly, took 1st for *Apricots*, *Apples*, and *Plums*.

Vegetables.—For a collection of twelve kinds, Mr. Mairs was a good 1st, with splendid examples of *Celery*, *Wright's Giant White*; *Carrot*, *Veitch's Intermediate*; *Cauliflower*, *Veitch's A Giant*; *Pea*, *Duke of Albany*; *Cucumber*, *Carter's Modal*; *Tomato*, *Ponderosa*; *Turnip*, *Veitch's Red Globe*; *Onion*, *Ailsa Craig*; *Brussels Sprout*, *Veitch's Exhibition*; *Leek*, *Renton Monarch*; *Runner Beans*, *Ne Plus Ultra*; *Potato*, *Satisfaction*.

The nurserymen exhibited extensively. Messrs. Veitch, of the Royal Nurseries, Exeter, exhibited a superb lot of foliage and flowering plants; also cut flowers of *Gladioli*, &c. Messrs. Jarman & Co., of Chard, staged a grand stand of miscellaneous exhibits. Mr. Kerswill, of Exeter, occupied the whole of one side of the centre stage in one tent with a splendid lot of decorative *Palms*, &c. Mr. Randall put up a fine group of plants, and several boxes of seasonable bloom. Mr. Ireland, Barnstaple, staged a large collection of *Apples* and fruits in remarkably advanced stage. Mr. Smale, of Torquay, had a large assortment of *Dahlias*, &c., in boxes, of excellent quality.

NATIONAL CO-OPERATIVE FLOWER SHOW AND FESTIVAL.

AUGUST 18, 19.—Year by year the horticultural department of this great festival at the Crystal Palace grows in extent and importance, and it is undoubtedly the leading feature in a comprehensive programme. It was reasonable to suppose that in the face of such a dry summer there would have been a considerable falling off in quantity and quality; but the number of entries fell very little short of last year, while the produce actually showed an increase of twenty per cent. The whole of the spacious nave, with the exception of the space under the centre transept required for the concerts, was occupied by the horticultural produce; and in addition to the 300 tables supplied by the Crystal Palace Company, representing some 5,500 superficial feet, sixty extra tables had to be provided, and they were in most instances inconveniently crowded. What falling off there was in the way of vegetables, such as *Beans*, *Peas*, and *Cauliflowers*, was amply compensated for in the astonishing increase in the number of plants and cut flowers, many of them brought from considerable distances; and also in the case of fruits, which were produced in much larger quantities than on any previous occasion, and of a quality previously unknown at these festivals. The rate of increase this year was something like fifty per cent. on the part of working-men, and seventy-five per cent. from gentlemen's gardeners. This year the experiment was tried of having the vegetables staged and judged on the Friday, the plants and cut flowers on Saturday, and it appeared to have answered very well, and greatly relieved the immense pressure of work of a one day's show, so many packages having to be opened and staged by the employés of the Agricultural and Horticultural Association, who originated and carries out the flower show. Sixteen judges were required to make the awards at the flower show, in marked contrast to the first two exhibitions held in the then conservatory of the Royal Horticultural Society, in 1886-87, when two only were required. So great an impetus has been given to gardening among the working-men all over the country who are members of co-operative societies by the annual flower show, that many societies have an exhibition in connection with their local co-operative society, and the area of allotment gardening has grown enormously in many localities in consequence.

Section I of the schedule, comprising nearly 130 classes for working-people only; all who are in any way professionally connected with gardening are relegated to section II. A very interesting series of competitions was for a collection of six vegetables neatly arranged, shown from all parts of the United Kingdom, and in order to place the exhibitors on a footing of equality it is divided into eight districts, each showing by itself. Nothing appeared to have been shown from the northern counties of Cumberland, Westmoreland, Northumberland, and Durham. A member of the Sawley Society sent the best collection in the North-western District, extending from Nottingham through Yorkshire, Lancashire and Cheshire, to Anglesea. A member

of the West Haddon Society was 1st in the Midland District, represented by a line drawn from Lincoln to Shropshire. Bromley was 1st, and Norwood 2nd and 3rd in the Metropolitan District. The Southern District No. 1, including the Northern Home Counties, had Banbury and Oxford 1st and 2nd. The Southern District were fortunate with Crawley and Horsham; the Western District, Chippenham and Lechlade. Scotland and Ireland were represented by a solitary collection, but it had so suffered upon the journey as to be out of condition. We may say generally of this section that vegetables, with few exceptions, were very good; Onions very fine and plentiful, Beet good, Cabbage much better than could have been expected, Carrots very fine, the Horn type in particular; Celery, red and white, very good; Cucumbers plentiful, the ridge varieties a little stale; Lettuce small; Lettuce, Cca and Cabbage very good; a few dishes of Peas very good; Radishes remarkably good in all types; Shallots very good; Potatoes large, handsome, clean, and bright, though some were rough; Tomatoes very good; Turoipa as good as could be expected; and Vegetable Marrows in great numbers and of all sizes. These remarks apply equally to section 2, but as some well-known vegetable exhibitors competed by reason of their membership, the quality was very fine. In this section plants were represented by excellent Ferns, tender and hardy Coleus, Begonias, double and single; Lilies, very good, especially the speciosum type; Pelargoniums, Fuchsias, and various annuals. Many of the foregoing plants were also well shown by working-men.

Cut flowers were a great feature; Perennials were extensively and finely shown in striking bunches, and many annuals were delightful, especially Phlox Drummondii, Sweet Peas, Salpiglossis, &c. The beautiful bunches of the first and last were a surprise. Zinnias, Asters, Marigolds, African and French; Petunias, Stocks, Indian Pinks, Dahleas, &c., were all very good, much better than could have been expected.

Fruit was extensively represented in section 2, very well-finished white and black Grapes; grand culinary and dessert Apples, capital Plums, Tomatos, &c., were to be seen in large quantities. There were classes for table decoration; also one for a dinner-table, competed for by ladies, a new introduction which proved highly successful, and will no doubt be extended in future years.

This is scarcely the place to dwell upon the moral advantages gathering about this festival. The visitor saw thousands of young people drawn from all parts of the country thronging the palace; quiet, well-behaved, considerate for others, and with an entire absence of anything in the way of rowdiness, larking or horseplay. There was thorough enjoyment, but in a serious business-like way, and all appeared radiantly happy. We may fittingly allude to the value of the moral restraint developed by those who, taking up gardening from a love of the beautiful, find in plants and flowers living teachers, imparting lessons that appeal to the higher parts of human nature. The union of a love of beauty with a sense of the advantage of utility must be an educational force, and in the right direction.

THE SHROPSHIRE HORTICULTURAL.

AUGUST 23, 24.—The Shropshire Horticultural Society held its nineteenth annual exhibition of plants, fruits, &c., on Wednesday and Thursday, in its own charming grounds (The Quarry), adjoining the town. The entries this year have been considerably more than in any previous year. All the details of the show were most smoothly and efficiently carried out by the committee and the energetic honorary secretaries, Messrs. H. W. Adnitt and W. W. Naunton.

Plants.—The post of honour was given in the schedule to a group of miscellaneous plants arranged for effect on a space of 300 square feet, the prizes being £20, £16, £14, and £12. The result of these liberal prizes was the arranging of five good groups. The 1st prize was awarded to Mr. A. Wells, gr. to J. H. Manners-Sutton, Esq., Ketham Hall, for a good arrangement, consisting of a bank of Crotons, Palma, Lilium auratum, Anthurium, Caladium, Ferns, &c., for a background, with a series of small groups, having a Palm, Dracena, Crotons, and such-like plants in the centre, with the intervening space covered with green moss. Mr. James Cypber, who was placed 2nd, had a lighter and more elegant arrangement, in which Oncidium incurvum, Dendrobium Phalenopsis Schroderianum (having four nice spikes of flower), Cattleya aurea,

C. Gaskelliana, Bridal Wreath, Vanda cœrulea, Caladium argyritea, &c., arranged similarly to the first, only being lighter in effect.

For sixteen stove and greenhouse plants in bloom, or foliage, not less than four in bloom, prizes, of £20, £15, and £10, were offered. Mr. Cypber was a good 1st, staging, among others, grand plants of Dipladenia amabilis, Allamanda Hendersoni, Bougainvillea glabra, Ixora Williami, grandly-coloured Crotona, Queen Victoria and angustifolius; extra-large Latania borbonica, and Kentia Fosteriana; Mr. Finch, gr. to Jas. Marriot, Esq., Coventry, was a creditable 2nd.

Mr. T. Lambert, gr. to Lord Harlech, Oswestry, was a good 1st in the class for six stove and greenhouse plants in flower, showing fine Ixora Regina, Allamanda Hendersoni, Dipladenia amabilis, Ixora Pilgrimi, and Croton Warreni.

Orchids.—For a group of not fewer than twenty Orchids, prizes of £12, £8, and £5, were offered. Mr. Cypber was a long way ahead with an extensive assortment, prominent among which were Dendrobium Phalenopsis Schroderianum, Odontoglossum crispum, O. Harryana, Cattleya gigas, C. Gaskelliana, Succolabium Blumei, Vanda cœrulea, having a spike of ten well-developed flowers; Cattleya aurea, Dendrobium Dearei, Laelia elegans, Oncidium incurvum, having several spikes of flower, &c., the whole being edged and intermixed with Maidenhair Fern.

Ferns.—1st, Mr. C. Roberts, gr. to C. H. Wright, Esq., Hatton Hall, was well to the front with six exotic Ferns, showing healthy plants, including a fine plant of Gymnogramma sulphurea. Mr. Penson, gr. to Lord Forester, Willey Park, Broseley, was 1st for a like number of plants, but much finer than in the preceding class (this one being confined to exhibitors residing in Salop), staging five fresh plants of Davallia Mooreana, Adiantum Farleyense, &c.

Orchids (confined to growers residing in Shropshire).—Mr. Davis, gr. to A. E. W. Darby, Esq., Little Ness, was the only exhibitor, and he was deservedly awarded 1st prize for nice plants of Cattleya gigas, having a dozen flowers; Dendrobium Dearei, in fine flower; Cypripedium Chamberlainianum, and Cattleya Aclandi.

Fruit was shown extensively and well. Prizes of £10, £6, and £3, offered for a collection of twelve kinds of fruit, brought out four good collections. Mr. Goodacre, gr. to the Earl of Harrington, Elvaston Castle, Derby, was 1st, with a good all-round lot, staging fine well-coloured bunches of Muscat Hamburg, Madresfield Court, Muscat of Alexandria, and Foster's Seedling Grapes (the latter rather green); good Cayenne Pine, grand dish of Brown Turkey Figs, good Noble Strawberries, Hero of Lockinge Melon, Walburton Peaches, Victoria Nectarines, Golden Eagle Peach, and Jefferson Plums.

Five collections of nine kinds were put up in the class confined to gardeners residing in Shropshire. Mr. H. H. France, Hayhurst, Wellington, was 1st with a fairly good lot of fruit, including good Lockinge Melon and Alnwick seedling Grapes.

Grapes.—Four hundred bunches of Grapes were staged, making a grand display, and were of a high order. Prizes of £10, £6, and £3 offered for six bunches of black Grapes, in three varieties, two bunches of each, brought forth twelve lots. Mr. Bennett, gr. to Hon. C. H. Wynne, Ring Cowen, North Wales, was well a-head, staging very large well-coloured bunches of Alnwick Seedling (one cluster would probably turn the scale at 7 lb.), Gros Maroc (fine in the berry, and of good finish), and Black Alicante; Mr. Goodacre being 2nd, with Gros Guillaume (large in bunch and berry), and well-coloured Black Alicante and Alnwick Seedling.

Twelve stands of three bunches of Black Hamburgs were staged, Mr. Brown, gr. to J. C. Sinclair, Esq., Rock Ferry, being well ahead with large, handsome, well-coloured bunches. Nine stands of any other Black were staged; Mr. Craven was well 1st with handsome, well-coloured bunches of Madresfield Court. Eight stands of four bunches of whites, in two varieties, were shown by Mr. Silk, gr. to T. M. Franklin, Esq., St. Hilliers, Cowbridge, who led with Golden Queen, and Muscat of Alexandria. Mr. Middleton was placed 1st for three bunches of Muscat of Alexandria, being very closely followed by Mr. Slade, gr. to the Duke of Newcastle, Clumber, Worksoop, who staged compact even bunches, fine in berry and of good colour. Eleven stands of Muscated were staged. In the any other white class, twelve stands were put up, 1st prize being awarded to Mr. Craven, for good Buckland Sweetwater.

In the Grape classes, confined to growers living in Salop, two bunches of each variety to be shown,

Mr. Langley, gr. to Rev. T. M. Bulkeley Owen, Tedmore Hall, West Fellow, was 1st, for good Black Hamburgs, with medium-sized well-coloured bunches, fine in berry, and beautifully coloured. With any other Black, Mr. Lambert, gr. to Lord Harlech, Oswestry, was well ahead with large bunches of Gros Maroc, fine in berry, and of good colour. The last-mentioned exhibitor was well 1st for Muscat of Alexandria, staging good tapering bunches of good-sized, well-coloured berries. Amateurs also showed well in the Grape classes.

Peaches and Nectarines were shown in fair numbers, and in good condition. Mr. Wallis, Keele Hall, Newcastle, was 1st for Nectarines, with Darwin; and Mr. Bannerman, gr. to Lord Bagot, Rugeley, had the best dish of Peaches in Violet Hatve.

Pines: Special Prizes.—Prizes and Certificates of Merit were accorded to Mr. Slade for five large fruits, four of Cayenne, and one of Charlotte Rothschild; and to Mr. Bennett for six good fruits, two of Cayenne, and four of Prince Albert, about 10 inches high, and having bright tips.

Vegetables were shown in great numbers, the various exhibits being of a high order in the generality of classes.

Special Prizes.—Out of six good collections of eight kinds put up for Messrs. Webb & Son's prizes, Mr. Wilkins was 1st, staging fine Autumn Giant Cauliflower, New Defiance Carrot, New Pearl White Celery, grand specimens of Ailsa Craig Onion, Satisfaction Potato, Promotion Peas, Eclipse Runner Bean, Sensation Tomato; 2nd, Mr. Pope, gr. to the Earl of Carnarvon, Hinchclere Castle, Newbury, with fine produce. The last-mentioned exhibitor was 1st in a good competition for Messrs. Taylor & Thomson's prize for a collection of twelve kinds, staging, among others, fine specimens of the Leek, Giant White Celery, Dobbie's Select Parsnip, Intermediate Carrot; Mr. Wilkins being 2nd. The last-mentioned exhibitor had the best collection of six kinds, the prizes being given by the same firm mentioned in the preceding class.

Potatoes were extensively shown, the tubers being of good size, clean, and even. Fifteen collections of six varieties were staged, Mr. Hathaway, gr. to the Earl of Latham, Latham, Ormskirk, led with good dishes of Cole's Favourite, Reading Russet, Satisfaction, Edgecote Purple, Chancellor, and Scarebrick Favourite.

Mr. Wilkins had by far the best nine Onions, showing Excelsior in fine form. Mr. Gannt, gr. to James Watson, Esq., Berwick, Shrewsbury, had the best dish of Turnips; and Mr. Hathaway led with fine specimens of Carrot, Long Red Surrey.

Mr. Wilkins was 1st for French Beans, showing good Canadian Wonder; Mr. Leith, gr. to J. R. Greatorex, Esq., Nytton Hall, Salop, was 1st for Peas; and Mr. Sheppard, Winchcombe, led with Tomatos (Perfection) in a good class. Mr. Waker, gr. to Sir W. Honyman, Bart., Cotton Hall, Whitchurch, was 1st for a brace of Cucumbers.

Miscellaneous Exhibits.—Messrs. Pritchard & Son, Frankwell Nursery, Shrewsbury, covered a long wide staging with Palms, Ferns, Liliams, &c., together with a large assortment of cut herbaceous flowers. Mr. T. S. Ware, London, contributed a grand lot of tuberous-rooted Begonias, in pots and in a cut state, the blooms (double and single) being of fine size, distinct, and of striking shades of colour; Goliath was a fine terra-cotta-coloured variety. Messrs. Hewitt & Co., Birmingham, contributed cut flowers and plants in pots, which together made a fine show.

Messrs. Cutbush & Son, London, had a fine arrangement of cut blooms of herbaceous and alpine plants. W. Eckford, Wem, Salop, staged thirty-two bunches of his charming varieties of the Sweet Pea, including the pretty blue, Emily Eckford. Messrs. Webb & Sons had a good collection of vegetables grown from seed supplied by them, including grand specimens of the Parsnip, &c. Messrs. Jarman & Co., Chard, also had a good exhibition of garden roots, &c. Messrs. Dicksons, Chester, had a fine lot of decorative plants and cut spikes of Gladioli. Messrs. Dobbie & Co., Rothesay, had cut flowers in great number.

Obituary.

MR. CH. B. SAUNDERS.—We regret to hear of the death of one of our valued correspondents, Mr. CH. B. SAUNDERS, of Jersey, on the 1st of August. He died "in harness," having been in good health and attending to business matters the day previous to his death, from apoplexy. Born January 4, 1824,

he received a first-rate education, and at the early age of 21 took over the management of his father's then very extensive business of a nurseryman and fruit grower, and carried it on with great energy and success until the last. He was much valued in the Channel Islands as an authority on gardening matters generally, and had the reputation of being a rare connoisseur of fruits, bulbous and hardwooded plants. His business will be continued by Mr. Becker.

WILLIAM WHITTAKER.—On the 15th inst., William Whittaker died at Slough, at the age of seventy-five. He was for many years the foreman of the plant-houses at the Royal Nursery, Slough, and the principal salesman. Going to the nursery sixty years ago, when quite a boy, he may be said to have grown with the growth of the establishment during the time it was in the occupation of Messrs. T. C. and E. Brown; their successor, Mr. Cutter; and finally in that of the late Mr. Charles Turner. William Whittaker was a most skilful soft-wooded propagator, and in his day many millions of cuttings and plants must have passed through his hands. Increasing infirmities compelled his retirement from the Royal Nursery in 1891, and as above stated, he died at Slough, where he had passed the whole of his life.

THE WEATHER.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

DISTRICTS. Above (+) or below (-) the Mean for the week ending August 1st.	TEMPERATURE.				RAINFALL. No. of Rainy Days since Jan. 1, 1893.	BRIGHT SUN. Total Fall since Jan. 1, 1893.	Percentage of possible Duration for the Week.	Percentage of possible Duration since Jan. 1, 1893.

POTATOES.

Arrivals are still very heavy and demand limited, except for finest samples, which realise 5s. 6d. to 6s. 6d. Ordinary samples hard to clear, except at very low prices. *J. B. Thomas.*

APPLE STOCKS: *G. H. H. M. Leroy of Angers, Balzet of Troyes.*

BEGONIAS: *G. F.* We recommend you to send the specimens to some grower who makes a specialty of these plants. We see nothing particular in either.

BOOKS: *Cacao.* You cannot get this book in England. Write to Mr. Finchley Hart, Superintendent of the Royal Botanic Gardens, Trinidad.

CARNATION LAYERS: *W. C. & Co.* The grubs are those of the cockchafer. Encourage rooks, or a tame jackdaw or two.

COLOUR OF FLOWERS: *Query.* The one you send (*Vinca minor*), we take to be blue. If anyone can suggest a better name, we should be glad to hear it.

CORRECTION.—In our report of Maidenhead Show last week, we should have stated that Mr. Herriou, of Bridge House, was 2nd in the competition for six Ferns, Mr. Jakeman was 3rd.

INSECTS ON CATTLEYA: *W. W., Uxbridge.* The swollen roots of Cattleya are caused by the Orchid-fly. The best way to deal with it is to cut off every root affected just above the swelling, and to burn the pieces so removed. Carefully watch and cut off others which may seem to be similarly affected as they appear.

MOVING STOCKS: *Allium.* If you are obliged to move them, do so as carefully as possible, and be prepared to lose a percentage; but if possible, we should prefer to allow them to remain until another season.

NAMES OF FRUITS: *H. W. S. Pluma:* 1, Magnum Bonum; 5, Kirke's; 6, Diamond; others rotter.—*C. M. B. Apples:* 1, Duchess of Oldenburg; 2, Lord Grosvenor.—*W. H. Apple, Summer Golden Pippin.*—*A. B. B. Not known.*—*A. B. 1, Kirke's; 2, Diamond.*—*Claude Lonsdale.* 1, Stone's Apple; 2, Irish Peach; 3, Dutch Codlin; 4, Duchess of

Oldenburg; 5, not known; 6, Yorkshire Beauty.—*Ancient Norwich.* 1, Beurré de Capiaumont; 2, Louise Bonne of Jersey; 3 and 4, Duchess of Oldenburg; others not known.—*T. C. 1, Kirke's; 2, Pershore; 3, Lawson's Golden Gage; 4, Prince Egglebert; 5, Jeffersons.*—*W. B. V. 1, Beurré Bosc; 2 and 5, Beurré Diel; 3, Marie Louise; 4, Urbaniste.*—*H. Wilks.* 1, Nectarine Violette Hative; 2 and 3, Peaches, probably Early York; 4, Royal George; 5, Grosse Mignonne; 6, Victoria. No one without a knowledge of the flowers as well as the leaves can name Peaches with certainty.—*One Anxious.* Apple New Hawthornden.—*X. 1, Too small to be identified; 2, Sea Eagle; 3, Gone too far; 4, Pine-apple Nectarine.* When packing Peaches, they should be gathered before too ripe. *Chadwick. Pears:* 1, 2, Williams' Bon Chrétien; 3, Autumn Colmar; 4, Not known; 5, Jersey Gratioli. *Apples:* 1, Lord Grosvenor; 2, Cellini; 3, Kerry Pippin; 4, Dutch Codlin; 5, Duchess of Oldenburg; 6, Duck's-bill.

NAMES OF PLANTS: *F. A. H. Lælia crispata.*—*H. W. W. Clitoria Ternata,* an old friend.—*H. M. E. Galeopsis Tetrahit.*—*J. P. Withington.* So far as can be made out from seedling plants only, your specimens are: 1, *Mandevilla suaveolens;* 2, *Catalpa bignonioides;* 3, Send when in flower; 4, *Mimosa sensitiva;* 5, *Melia Azedarach;* 6, *Oxalis corniculata rubra.*—*H. E. B. 1, Lygodium scandens;* 2, *Selaginella atro-viridia;* 3, *S. cuspidata;* 4, *S. Wildenovii;* 5, *Pellionia pulchra;* 6, *Pilea microphylla (muscosa).*—*R. A. 1, Abelia rostrata;* 2, *Pellionia Daveana.*—*E. R. Arauja albena.*—*D. H. L. 3, Bomaria hirtells;* 4, *Ichroma tubulosum.*—*No name: Box labelled Fry's Chocolate.* 1, *Platanus acerifolius;* 2, *Acer Negundo;* 3, *Medicago echinua (Calvary Clover);* 4, *Athyrium filix-œmina;* 5, *Kerria japonica.*—*V. Coreopsis grandiflora.*

NUTS: *D. M. G.* There is nothing to be found in the Filberts now. A possible explanation is, that they were attacked in the first instance by the grubs of the Nut-weevil (*Balaninus nucum*), and that the large holes were made by tit-mice in their endeavours to extract the grubs of the weevil. *R. McL.*

POTATOES: *Arthur Ransom.* The cause of the red stains on Potatoes is a minute organism, *Micrococcus prodigiosus*, which appears on bread, Potatoes, meal, and various other substances in hot weather. It is known in Germany as "Blut im brode." The spots are in the form of irregular groups of blood-red drops of different size, which in some places are distinct, and in others are confluent. The individual bodies of which the spots consist are mere molecules, with a diameter of one-two thousandth to one-four thousandth of a line, mostly round, occasionally oval, and sometimes slightly constricted in the middle. When they lie close together in large numbers they are quiescent, but when more dispersed, have an ordinary molecular motion. At first it was called *Monas prodigiosa* by Ehrenberg, and was considered by him to be an animal of low organisation. Afterwards it was transferred to the Algae, under the name of *Palmella prodigiosa*. Now, it is recognised as a Bacillus, or Micrococcus, and is classed with Microbes under Schizomycetes, as a degraded form related to the fungi. It may be transferred readily from the Potato to bread, rice, and meat, and, in former times caused great alarm to the superstitious. *M. C. C.*

PRESERVING ORNAMENTAL GRASS: *S. A. T.* We always find it best to cut this before it is quite ripe, and hang it up, as you say, in a cool dark place.

SEEDLING APPLE: *Evans, Hassocks.* A good sized very pretty Apple, somewhat resembling in appearance Duchess of Oldenburg, but, sweet and pleasant to the taste. A very promising early dessert Apple.

VINE DISEASE: *B. R.* At all risks we should cut away and burn all affected parts. We have not much faith in drugs in this case.

THE IMPROVED GARDEN GULLY
 (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

6-in., 1s. 6d.; 8-in. 2s.; 10-in., 3s.; 12-in., 6s. 6d. 15-in., 8s.
 (The larger sizes are very strong for carriage drives.)

Full Particulars and Testimonials on application.

HILL & SMITH'S
BLACK VARNISH
 for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)

An excellent substitute for oil paint, at one-third the cost.

Used in all the London Parks, at Windsor, and Kew Gardens, and on every important estate in the Kingdom. Has stood the test of forty years' trial. Requires no mixing; can be applied cold by any ordinary labourer. Price 1s. 6d. per gallon at the manufactory, or carriage paid to any railway station, 1s. 8d. per gal. in casks of 36, 18, or 8 gals.

Every Cask bears the above

CAUTION.—Registered Trade Mark. Beware of cheap imitations.

GARDENER and BAILIFF; age 44, no family.—A GENTLEMAN can highly recommend his late Gardener and Bailiff; was with him nearly seven years. Thoroughly practical in all branches of gardening; also Land and Stock. Wife first-class Dairy-woman, if required. Apply first, H. HATCH, Moorlane, Lingfield, Surrey.

GARDENER (WORKING), where two or more are kept; married. The Hon. RICHARD MORETON wishes to highly recommend the above. Leaving for no fault. Seventeen years' good character. Hants or Surrey preferred. Crookham House, Winchfield.

GARDENER—A Lady recommends a middle-aged man as above; understands Greenhouse, Vines, &c.; several years' good character; Suburbs of London preferred.—S. STOCKBRIDGE, 13, Inver Road, Upper Clapton, N.E.

GARDENER.—Age 30, married; one child, age 8; good knowledge all-round; seven years' good character.—GARDENER, Mrs. Tod, Cheshunt Street, Cheshant, Herts.

GARDENER (SECOND, or SINGLE-HANDED).—Age 25; single; eleven years' experience in Nurseries. Good character.—W. F., 8, Trinity Terrace, College Park, Lewisham.

GARDENER (SECOND), in a good establishment.—Age 26, single; total abstainer. Thoroughly experienced in Orchids and other branches. Three years in present situation; good references. Distance no object.—STRATFORD, The Gardens, Silverdale Lodge, Sydenham.

GARDENER (SECOND), where three or more are kept.—Age 21; Inside and Out; Second in present situation; two years' good character; previous character if desired; abstainer.—BRILL, Lock Road Cottage, Ham, Surrey.

GARDENER (good SECOND, or SINGLE-HANDED)—Good references and experience.—Apply, G. FORDER, The Gardens, The Deanery, Salisbury.

GARDENER (SECOND).—Age 25 ten years' experience Inside and Out.—W. O., Gardener's Cottage, Five Fields, Dulwich, S.E.

GARDENER (SECOND, or JOURNEYMAN).—Age 23; seven years in good Gardens. Experienced in Fruit, Stove, and Green-houses. Abstainer, good reference.—STOKES, Guild Terrace, Wilton, Salisbury.

GARDENER (SECOND, or FOREMAN), where four or more are kept. Age 26; Good knowledge Inside and Out. Good references, abstainer.—X. Y. Z., 18, Mona St., Beeston, Notts.

GARDENER (UNDER).—Age 21; good experience in Outside Gardening. Willing and obliging. Abstainer. Good references.—A. H., Ivy Villa, Ivy Road, Hounslow, Middlesex.

GARDENER (UNDER).—A CLERGYMAN wishes to recommend a Young Man as above. Three years' good character.—O. Rev. J. Sanderson, Alderholt Vicarage, Fordingbridge, Hants.

GARDENER (UNDER, or SINGLE-HANDED).—Age 20; four years' good character.—H. S., 3, Circus Terrace, Greenwich.

GARDENER (UNDER), Inside and Out.—Age nearly 19. Well recommended. Fifteen months' experience.—W. HOBDDAY, Ettington, Stratford-on-Avon.

GARDENER (UNDER), or in a Market Nursery.—Well up to the work; good character.—C. GRAY, 6, Water Lane, Stansted, Essex.

TO NURSERYMEN.—A. G. RODWELL, for many years manager of the Glass Department (Isleworth branch) of Messrs. Chas. Lee & Son, is OPEN to an ENGAGEMENT in a good firm. Well experienced in Stove and Greenhouse Plants, Bedding Stuff, Cyclamen, Bouvardias, Pot Vines, &c. Unexceptional character.—Woodbine Cottage, Isleworth, Middlesex.

FOREMAN, in the Houses, in a good establishment.—Age 25; nine years' practical experience with Fruit, Plants, &c.—H. MIDDLETON, 53, The Grove, Ealing, W.

FOREMAN (WORKING, OUTSIDE).—Age 34, married; seventeen years' experience in Fruits, Roses, Ornamental Trees and Shrubs.—G. A. MOORE, 6, Forest Road, Loughton, Essex.

FOREMAN, in good establishment.—Age 27; twelve years' experience in all branches. Twelve months in present situation. Can be well recommended.—J. CRANE, Hall Place, Bexley, Kent.

FOREMAN, or GROWER, in a Small Nursery.—Age 28, married; well up in Grapes, Cucumbers, and Tomatos.—PARSONS, Clapton, near Portishead, Somerset.

FOREMAN, Inside, or General, in good establishment; age 28.—Mr. JARMAN, Gardener to L. C. Brassey, Esq., Preston Hall, Aylesford, Kent, can highly recommend F. Low to any Gardener in want of a thoroughly capable man. Four and a half years as Foreman in present situation.

FOREMAN, or JOURNEYMAN (FIRST).—Mr. MASON, Gardener to Sir E. H. Elton, Bart., wishes to recommend a young man (age 23) as above. Has been with him over four years.—Court Lodge, Clevedon, Somerset.

FOREMAN, or JOURNEYMAN (FIRST).—Age 28; ten years' experience in Fruit, Plants, and Orchids. Disengaged.—A. B. C., 2A, Brompton Road, S.W.

FOREMAN; age 25.—Mr. J. WADHAM, the Gardens, Holmby, Dorking, will be pleased to recommend W. Brown to any Gardener wanting an active and trustworthy man as above. Well versed in Plant and Fruit-Growing in general. Ten years' experience.

FOREMAN (Inside).—Age 27; ten years' experience in Plant and Fruit Houses; good references.—GEO. THOMPSON, Park Gate-house, Westwell, Ashford, Kent.

FOREMAN, in a good establishment.—Age 24. Good practical experience in Fruit and Plant Growing. Good testimonials.—W. SUTTON, Hawkstone Gardens, Shrewsbury.

FOREMAN (INSIDE).—Age 26; English. Mr. WARD, Head Gardener to Lord Dunleath, Ballywalter Park, co. Down, Ireland, can with confidence recommend his Foreman, George Allibone, who has had thirteen years' practical experience; five years previous as Foreman, and is a thorough practical man, of excellent character and ability. Capital at Table Decoration. Has been in good places in England.

FOREMAN, Inside or Out.—Age 24; two and a half years in last situation, under Mr. Owles, Apley Castle, Wellington, Salop, who will be pleased to answer any enquiries.—F. ASTLEY, Puford, Wrexham.

FOREMAN, in the Houses.—Age 25; eleven years' experience. Five years' excellent character from last place. House and Table Decorations.—J. HIBBITT, The Laurels, 7, Farm Avenue, Streatham.

NURSERY FOREMAN (General Outside).—Age 25, single; seven years' experience.—T. H. FULLER, Messrs. G. Jackson & Son, Woking, Surrey.

FOREMAN PROPAGATOR and GROWER.—Fourteen years' trade experience. Competent Salesman. Well up in Roses, Clematis, Soft-wooded Stuff, Palms, Ferns, &c. Highest references.—VICTOR, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

FOREMAN, or MANAGER, in a Small Nursery.—Age 32. Well up in Ferns, Palms, Tomatos, Cucumbers, Mushrooms, &c.—W. D., 6, The Terrace, Grove Road, Mitcham, Surrey.

FOREMAN, Indoor, or General.—Age 26; ten years' practical experience in all branches. Three years in present situation.—W. WATERS, The Gardens, Kelsey Park, Beckenham, Kent.

TO Nurserymen.
PROPAGATOR and GROWER of Ferns, Foliage, and Soft-wooded Stuff.—Age 24; ten years' London Market experience.—SOLIMON, 4, Beaconfield Cottages, Hillingdon Heath, near Uxbridge.

TO Nurserymen.
PROPAGATOR, or PROPAGATOR and GROWER.—Age 27; twelve years' experience in first-class London Nurseries. Knowledge of Stove and Greenhouse Plants, Palms, Pot-Vines, Pot-Roses, &c. Good references.—B. E., 6, Manor Place, Tottenham Lane, Hornsey, N.

PROPAGATOR and GROWER, in a small Nursery, of Pot, Cut, and Bedding Plants, Cucumbers, Tomatos, &c.—F. SPARY, 15, Pentlow Street, Putney, S.W.

TO NURSERYMEN and OTHERS.—Advertiser seeks a situation in a Market Nursery or Private Place as GROWER of Roses, Carnations, Ferns, and other Flowers for Market or Private Purposes. State wages.—KIMPTON, 5, Evelyn Road, Ham, Surrey.

JOURNEYMAN, in a good private establishment.—Age 20; Inside or Outside and Out; good characters.—W. S., 7, Helena Road, Windsor, Berks.

JOURNEYMAN.—Age 21; Inside or Inside and Out.—Mr. WARD can with confidence recommend a steady and reliable young Englishman as above.—The Gardens, Castle Malgwyn, Llechryd, South Wales.

JOURNEYMAN, in the Houses, or Inside and Out.—Age 24; ten years' experience; first-class references and testimonials.—E. TEEAR, High Street, Husbands Bosworth, Rugby.

JOURNEYMAN, in the Houses.—Age 19; two years and a half in previous place; over eighteen months in present.—N. SMITH, Barrell's Park, Henley-in-Arden.

JOURNEYMAN, in the Houses.—Age 22; eight years' experience. Inside and Out. Good reference.—E. SMITH, Wood End Gardens, near Chichester, Sussex.

JOURNEYMAN, in the Houses.—Age 23; nine years' experience. Good references.—W. FOOTE, 41, Lansdowne Road, Clapham, S.W.

JOURNEYMAN, in the Houses.—Age 20; good reference.—R. HAMBROOK, The Gardens, Otter-shaw Park, Chertsey, Surrey.

JOURNEYMAN, Outside.—Age 22; six years' good practical experience in extensive Gardens. Good hand at Chrysanthemums.—Mr. W. COLLETT, The Gardens, Sudbourn Hall, near Wickham Market, Suffolk.

JOURNEYMAN, in the Houses.—Age 26; five years' good experience in Vines and Stove Houses. Good character. Willing and obliging.—LUXTON, Moreton Gardens, Bideford, Devon.

JOURNEYMAN, in the Houses.—Age 19½. Six and a half years' experience. Good character. Bothy preferred. Can be well recommended.—W. THURSTON, The Gardens, Playden, Berkhamsted, Herts.

JOURNEYMAN, Inside; age 21.—Mr. J. P. McCULLOCH, Gardener to Sir Alexander Acland Hood, Bart., M.P., St. Andrew's, Brighton, wishes to recommend B. Miller, who has been with him two years. Inside; bothy preferred.—Apply, B. MILLER, Ch. Crookham, Farnham, Surrey.

JOURNEYMAN, Inside, or Inside and Out.—Age 22. W. SHARPE, Gardener, Sandown House, Esher, wishes to recommend Alfred Tyrrell, who has been with him three years.

JOURNEYMAN.—Age 20. Five years' experience; good characters; bothy preferred; disengaged.—J. IRONMONGER, Newborough, Barton-on-Trent.

IMPROVER, under Glass, to an all-round Nurseryman.—Age 21; under-tinds Tomatos and Cucumber Growing, and the Cut Flower Trade. Willing to go abroad if required. Good character.—A. D., 1, Heathfield Road, Wandsworth Common, S.W.

IMPROVER, in a Private Place.—J. S. UPEX, Wigganthurpe, York, wishes to recommend a strong lad, age 19, as above. Four years' experience Inside and Out.

IMPROVER, Inside, or Inside and Out.—Age 19; five years' experience. Good references. Bothy preferred.—H. C., 41, Wellington Street, Strand, W.C.

COLLECTOR of RENTS in the Country.—Age 33 years; fourteen years' character. High-st references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO GARDENERS.—A Youth wishes to learn Gardening. Has had slight experience. Small premium, or time.—F. S. M., School Cottages, Great Barr, Birmingham.

TO GARDENERS.—Situation wanted by a Young Man (age 23) in a Nursery or Gentleman's Garden, or as Gardener Lshourer.—G. SHARMAN, Jan., Station Road, Belton, Great Yarmouth.

TO NURSERYMEN.—Age 23; experienced in Palms, Ferns, Roses, Carnations, and in first-class London Nurseries. Good references.—A. IRELAND, 53, Devonshire Road, Chiswick, S.W.

TO NURSERYMEN.—A young man seeks re-engagement in-works. Six years' experience in London Market Nurseries; good all-round hand; two years in present situation; highly recommended.—E. H. BROWN, Dyson's Lane Nurseries, Upper Edmonton.

TO NURSERYMEN.—Situation wanted in a Market Nursery. Thoroughly experienced in Vines, Tomatos, Cucumbers, &c.—J. J., 7, Cambridge Cottages, Ponders End, London, N.

TO NURSERYMEN and FLORISTS.—A young Man seeks a situation. Is of good address; thorough knowledge of Wreaths, Crosses, and Bouquets, and the Decorative trade; experienced in all branches.—F. M., 4, Markenfield Road, Guildford.

TO SEEDSMEN, &c.—Situation required in the Seed and Ball trade. Age 17; experienced; references.—G. T. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

COWMAN, or KITCHEN GARDENER, on a Gentleman's place.—Age 25, single; young man thoroughly understands all kinds of Stock. Four years' good character. Near London preferred.—BRIDGER, 4, Talbot Road, Twickenham.

COWMAN.—Age 26, married, no family; thoroughly understands Jersey and other Cows. Wife useful in House, or for Lodge gate. Disengaged September 29. Good character.—S. E., School Walk, Sumbury, Middlesex.

SHOPMAN (HEAD), SALESMAN, or ASSISTANT—Advertiser seeks vacancy, as above. Age 21. Life experience in Seeds, Bulbs, Fruit, Plants, and Flowers. Exceptional testimonials from London and Provinces.—ABUTLON, 4, Cross Street, Manor Street, Clapham, S.W.

SALESMAN, in a Nursery.—Three years' experience in Covent Garden; well recommended.—W. S., 7, Cross Court, Bow Street.

CLERK, or any position of trust.—Good Book-keeper and Correspondent. Well up in all branches of the Nursery and Seed Trade. Sixteen years' experience in first-class houses.—SEEDS, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS.—A thoroughly experienced man in Bouquets, Wreaths, Fancy Designs, &c., requires situation as MANAGER or FIRST HAND.—B., 62, Camden Road, N.W.

TO FLORISTS.—Situation wanted by an all-round Man. Well up in Pot Stuff, also Tomatos, Cucumbers, &c. Good character.—C. I., Roman Villas, Bexley Heath.

SOW THE SEEDS of good Health, prune and strengthen sickly and weak branches of the tree of life, with the aid of Holloway's World-Renowned Pills and Ointment. The Pills improve the appetite, strengthen the digestion, and regulate the liver. Under treatment with the Ointment, bad legs become sound, scorbutic skins cast off their scales, and scrofulous sores cease to annoy. When rubbed upon the abdomen, it checks all tendency to irritation in the bowels, and averts diarrhoea, and other disorders of the intestines frequently prevailing through the summer and fruit-seasons. Heat bumps, blotches, pimples, inflammation of the skin, and enlarged glands, can be effectively overcome by using Holloway's remedies, according to instructions given to each purchaser.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No Cost for Motive Power, which is obtained from the Stream of Water passing through the Ram.

NO OILING OR PACKING REQUIRED.

MADE IN SIZES TO RAISE FROM 300 TO 200,000 GALLONS PER DAY. WILL FORCE TO A HEIGHT OF 1500 FEET.

This ram works with no metal in motion.

This view represents a ram worked by impure river water, whilst pumping pure water from a well or spring, and forcing it to a small reservoir on the hill, at an elevation of 295 feet, and a distance of 1 mile, from which reservoir the water is gravitated for fire extinguishing and general requirements of mansion, stables, farm, and village.

TESTIMONIALS.

From CHARLES HART, Esq., A.M.I.C.E., 3, Avenue Road, Leamington,
March 13, 1893.

BRIZWORTH UNION RURAL SANITARY AUTHORITY, EAST HADLON WATER SUPPLY.
DEAR SIR,—Since the opening of these works, in May, 1891, the two Double-acting "B" Rams supplied and fixed by you have done their work with a minimum of attention, uninterruptedly and satisfactorily. Pure spring water obtained from a gathering ground on the side of a hill is carried along iron pipes a distance of 548 yards, down to a cistern fixed in the ram-house. From this cistern it flows to the rams, which are driven by impure water—drawn from an adjacent brook, with an available fall of 12 feet—and thence by them forced along an ascending delivery pipe, a distance of 1520 yards, to an iron reservoir, at an elevation of 204 feet. From this reservoir mains are laid which supply the hall with its stabling, the rectory, six farm houses, two dairies, and twenty-four wall fountains for the villagers' use.

The average daily consumption exceeds 4000 gallons, which one ram easily delivers, thus exceeding your guaranteed quantity by more than 1000 gallons per ram per 24 hours. Generally the two rams are regulated to divide the work between them, but occasionally it devolves upon one only.

If more widely known, this means of supplying villages and small towns with a limited quantity of spring water, forced to a suitable elevation by means of your rams, driven by impure water, would most certainly be more generally adopted.—Yours faithfully,

CHARLES HART.

From the Right Honourable the EARL of HARROWBY, 44, Grosvenor Square,
London, February 21, 1893.

SIR,—I have pleasure in stating that the two Hydraulic Rams, which you supplied and fixed for me last autumn, at S. Union, have proved so far most successful, and that the work gives every promise of durability, while the economy, compared with the former much smaller and intermittent supply by steam pump, will be considerable.

With a fall of about 14 feet from a previously existing mill pool, the rams supply reservoirs 155 feet above the brook whence the water is forced, through pipes of $\frac{1}{2}$ mile in length.

They sent up, as long as I required it, about 41,000 gallons per day.

I now generally work the two rams alternately (for a fortnight or so each), but can at any time work the two together, if the full supply of 41,000 gallons should be needed.

The business of this somewhat complicated water-supply was conducted by you with singular promptness and punctuality; and no local difficulties arose in the execution of the work, owing to the excellent and efficient men whom you sent from your works at Accrington.

I am, Sir, your very obedient servant,
HARROWBY.

From Mr. J. A. RUTHERFORD Agent to C. F. H. Bolekow, Esq., Estate Office,
Marton Hall, Middlesbrough, September 26, 1883.

DEAR SIR,—I am glad to say that the Rams you put down on the Hambleton Estate, for Mr. C. F. H. Bolekow, are working very well. You undertook with 16 gallons per minute, to send up 1500 gallons a day, and with enough water to work the Rams at full power, 2000 gallons a day. With a supply of 11 $\frac{1}{2}$ gallons per minute they are lifting 2200 gallons, and when working full power, 3105 gallons per day are sent up to a height of nearly 400 feet. They made a clear start, and have gone well since. The delivery pipe in the above case is 9000 feet in length.

From THOMAS ROBERTS, Esq., Estate Surveyor to His Grace the Duke of Sutherland, K.G., Surveyor's Office, Trentham Hall, Staffordshire, April 13, 1886.

DEAR SIR,—I am pleased to say that the Hydraulic Ram you supplied and fixed at Tittensor (the residence of the Marquess of Stafford, M.P.), does its work very satisfactorily, with a fall of 9 feet 6 inches, raising 9000 gallons daily to a height of 150 feet. The Duke of Sutherland, K.G., inspected the working of the Ram, and expressed his entire satisfaction with it.

I am, yours faithfully,
THOMAS ROBERTS.

From Sir S. M. MARYON WILSON, Bart., London, November 17, 1891.

SIR,—I have much pleasure in stating that the two "A" Rams you supplied and fixed for me at Searles, on my Sussex estate, have proved a great success, especially when the small supply of driving water is considered, as with a supply of 7 gallons per minute only, they have daily thrown 2000 gallons to a height of 96 feet, and through a service of pipes over a mile in length; and testing them recently (with plenty of driving power) found they lifted 7000 gallons per day. The economy effected by their use is considerable, as they have entirely superseded a steam pump.

S. M. MARYON WILSON.

From HENRY MORTON, Esq., Agent to the Most Honourable the Marquess of Ripon, K.G., Ripon, April 12, 1886.

DEAR SIR,—The Patent Ram, with $\frac{1}{2}$ mile of service pipe, a large galvanised tank, and other fittings, which you fixed for the Marquess of Ripon, for the conveyance of water from Hutton Moor Springs to Blows Hall and Copt Hewick Hall, are highly satisfactory to all concerned, both as an engineering success and the intrinsic merits of the materials supplied. About 6000 gallons of water per day are forced into the tank at Blows Hall, nearly a mile distant, and 127 feet above the Ram, the overflow falling into a 20,000 gallon underground tank, from which it gravitates through the 4-inch main 800 yards long, with a fall of 70 feet, to the service-cocks and fire-plugs at Copt Hewick Hall, where, in case of fire, two or three powerful jets of water can be thrown on to the roof of the Hall.

I consider your method of carrying out the work is everything that could be desired, and, whilst the waste-power water from the Ram is less than you specified, the quantity elevated is just what you guaranteed. I am, dear Sir, yours very truly
HENRY MORTON.

From T. H. SIDEBOTTOM, Esq., Etherow House, Hadfield, February 22, 1882.

Induced by the good report of my cousin, Mr. J. A. Sidebottom, as to the working of the Hydraulic Ram he had from you, I ordered the one you fixed here a year ago, which I am pleased to say has since worked well night and day. Yet the two Rams you fixed at Snow's Hill Manor, Gloucestershire, for my brothers and myself, are, I think, a still more remarkable example of your success. We had a Ram fixed by a well-known firm, which proved a miserable failure, and which your Rams displaced. They are forcing the water through three-quarters of a mile of delivery-pipe, a little in excess of the quantity you guaranteed, to an elevation of 340 feet, and without the slightest hitch to the time of the last report from our tenant.

From Mr. HENRY ROBINSON, Engineer to the Stockport District Waterworks Company, September 8, 1883.

DEAR SIR,—I can now report well of the two Hydraulic Rams we have fixed to your instructions for the supply of Disley village; 40,000 gallons per day was the quantity you promised they would force to a height of 68 feet, but, on testing them, I am convinced that 50,000 gallons is not the limit of their power, whilst the quantity of waste water used in driving them is not equal to half the capacity of the 6-inch pipe by which they are fed, and I am inclined to the belief that a more simple and efficient pump cannot be found.

JOHN BLAKE, PATENT RAM WORKS, ACCRINGTON, LANCASHIRE.

N.B.—The Stock this Season is particularly well-grown, special attention being invited to the HEATHS, also the SOLANUMS and ROSES, which are the best ever offered at this Nursery.

Friday Next.—Orchids.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, September 8, at half-past 12 o'clock.

AERIDES RADICOSUM, An extremely rare and beautiful species from highlands in India, requiring only the warm end of the cool Orchid-house to grow it. Flowers in rich racemes? varying from rose to purplish-crimson. The plants offered are in fine condition.

AERIDES WARNERI, The most beautiful and compact growing of the A. crispum section. Flowers large crimson and white, and very fragrant. A few only received, but they are in splendid condition.

BROUGHTONIA SANGUINEA MAJOR, The large light-coloured bulbous rich crimson Broughtonia, very free to grow, and flower fine leafy masses; and various other Orchids of special interest.

On view morning of Sale, and catalogues had.

Friday Next, September 8.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on FRIDAY NEXT, September 8, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., a splendid collection of ESTABLISHED and IMPORTED ORCHIDS, such as grand specimens of Cypripedium Ainsworthii, C. robustum, Orphanum, Sedeni calurum, Cardinale, candidulum, Schlimi, an extra large specimen of the beautiful Cymbidium giganteum, several nice plants (semi-established), Lælia elegans, a fine Collection of Vandas, among them a grand plant of V. Storei—this is supposed to be the finest specimen in this country; semi-established plants of Lælia tenebrosa, true; a select Collection of Angraecums, the rare and most attractive Calogyne Meyeriana, a small Importation of Vanda Cathcartii in splendid condition, a choice Collection of Masdevallias for cool and intermediate house; Trichostilia suavis alba, and many other rare and beautiful ORCHIDS, the whole without the least reserve.

On view morning of Sale, and Catalogues had.

Important to the Trade.

LILIUM HARRISI.

Received direct from Bermuda,

FOR UNRESERVED SALE.

ENORMOUS IMPORTATION of 48,000 BULBS.

Also 775 LILIUM LONGIFLORUM

And other LILIPS.

The consignment comprises 239 Cases, and they will be offered one case in a lot, as received, the contents varying from 50 to 500 in each case, according to size. The quantities are as follows:—

1,070 extra large, 11 to 15 inches and upwards, 7,160 nine to eleven inches, 30,720 seven to nine inches, 10,000 five to seven inches.

MESSRS. PROTHEROE AND MORRIS will SELL the above extensive consignment in their BULB SALE, at the Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on THURSDAY, September 14 (being Thursday in the Great Trade Sale Week). The Sale commences at 12 o'clock, but the LILIUM HARRISI will be offered at 2 o'clock, and sold without the slightest reserve.

Friday, September 15.

MESSRS. PROTHEROE AND MORRIS will **SELL** by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY**, September 15, by order of F. Sander & Co., St. Albans, ESTABLISHED and IMPORTED ORCHIDS, among which will be found the following:—

ONCIDIUM VARICOSUM ROGERSII.
The gigantic, brilliant, Buttercup-coloured form, the grandiflora type of this superb Oncidium. Flowers are 3½ inches across in many cases, and are suspended in the air like huge butterflies with expanded wings; frequently 200 and upwards of lovely Buttercup-yellow flowers are carried on a single inflorescence. The flower-spikes are much branched, and in bloom present a mass of glowing colour quite unequalled by any other Oncid. The true Rogersii form exists only in solitary places, and has not been imported for many years, owing to the difficulty of finding it in its native home, where it seems to have been nearly extirpated.

It is the most brilliant and attractive of all Oncids.
CYPRIPEDIUM SANDERIANUM.
The most remarkable and longest-petalled of all the known species of Cypripedes. Its ribbon-like petals frequently attain a length of 2 to 3 feet, and are richly coloured with purple and yellow, the lower part being spotted and barred; as many as five and six blossoms are borne on one stem, and several are expanded at the same time. It is the most distinct and remarkable of all the Eastern Cypripedes, and is well worthy a place in the most select collections.

DENDROBIUM LOWII.
This very beautiful Dendrobium is now extremely rare, and very few are at present in cultivation. The flowers, which are borne in clusters of five or six, are bright buff-yellow, 2 to 3 inches across, the lip being stained with crimson at the apex, and traversed by lines of long red hairs springing from a crimson base. A free-flowering and brilliant Dendrobe.

DENDROBIUM MIRRELIANUM.
Extremely rare, very quaint and beautiful, carrying thyrses of delicate creamy-yellow flowers.

EULOPHIELLA ELISABETHÆ.
The new and beautiful Orchid from Madagascar, discovered by M. Hamelin.

Flowers white, with the outer surface purplish-red, callus of the lip orange-yellow; in shape they resemble Phalenopsis blooms, and as many as fifty flowers were seen on a single inflorescence on plants in a wild state by M. Hamelin.

The plants are in grand order, and are breaking freely.
HABENARIA GIGANTEA VAR. SUMATRANA,

syn. H. Susanne var. Sumatrana.
Flowers white, very large, somewhat resembling in its heavily-fringed labellum, Brassavola Digbyana, but having larger blossoms than the latter. The flowers are borne on upright stems, after the manner of Disa grandiflora.

CYPRIPEDIUM NICHOLSONIANUM.
(Provisionally named.)

A distinct Cypripedium from the Island of Palawan.
EPIDENDRUM FORGETIANUM. (New.)
The habit and form of the pseudobulbs are similar to those of E. seligense, E. vitellianum, and others; but the colour of the flowers is different. The sepals are spatulate, concave near the lip, and of a dusky yellow, netted with deep brown; the petals are roundish and clawed. The three-lobed lip has a creamy ridged middle lobe, and the lateral ones are rosy, with deeper lines, and folded over the purple column.

Awarded Botanical Certificate, June 20, 1893.
ONCIDIUM SANDERIANUM.
(Provisionally named.)

A new and superb Oncidium from Venezuela.
Flowers rosy red, borne in hundreds on dwarfish many-branched spikes, forming a perfect bouquet when in bloom.

Oncidium Jonesianum	Calanthe vestita
" Gravesianum	Dendrobium noble
Cymbidium eburneum	Epidendrums, &c.

On view morning of Sale, and Catalogues had.

Every Day.

B. S. WILLIAMS & SON
VICTORIA and PARADISE NURSERIES,
UPPER HOLLOWAY, LONDON, N.

EXHIBITION.

NATIONAL CHRYSANTHEMUM SOCIETY.—EXHIBITION OF EARLY CHRYSANTHEMUMS, with **DAHLIAS, GLADIOLI, &c.**, at the Royal Aquarium, Westminster, September 5, 7, and 8.

Schedules of Prizes on application to—
RICHARD DEAN, Hon. Secretary and Superintendent, Ranelagh Road, Ealing, W.

Royal Parks, &c.—Grass Seeds.
THE COMMISSIONERS of **H.M. WORKS, &c.**, are prepared to receive **TENDERS** for the **SUPPLY** of **GRASS SEEDS** for use in the Royal Parks, &c., during the year 1894. Forms of Tender, containing full particulars, may be obtained at this Office, any day except Saturday, between the hours of 12 and 3.

Tenders are to be delivered before 12 o'clock, Noon, on **FRIDAY**, the 8th proximo, addressed to "THE SECRETARY, H.M. Office of Works, 12, Whitehall Place, London, S.W.," and endorsed, "Tender for Grass Seeds, Royal Parks, &c."
The Commissioners do not bind themselves to accept the lowest or any tender.

H. W. PRIMROSE, Secretary.
H.M. Office of Works, &c., 12, Whitehall Place, S.W.
August 25, 1893.

Borough of West Ham.—To Nurserymen, &c.
THE COUNCIL hereby invite **TENDERS** for the supply and delivery of about 900 **TREES**, 11,000 **SHRUBS**, and 600 **CREEPERS**.

Further particulars may be obtained at the Office of Mr. Lewis Argell, Borough Engineer, Town Hall, Stratford, E. Tenders endorsed "Tender for Trees, &c.," to be sent to my Office not later than Saturday, September 16th, 1893.

The Council do not bind themselves to accept the lowest or any Tender. The Contractor will be required to enter into a bond, with one surety, for the due performance of the Contract, and no work will be ordered under the Contract until such bond has been duly executed.

The Contractor whose Tender is accepted, and with whom a Contract is entered into, will be required to pay to the whole of his workmen such rate of wages, and observe such hours of labour, as are recognised by the Workmen's Trades Unions and in force at the time of signing the Contract. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council,
FRED. E. HILLEARY, Town Clerk.
Town Hall, West Ham, E. 29th August, 1893.

10,000 GENISTAS, in small 60's, extra fine plants, £1 10s. per 1000, 10s. per 100, cash with order. Post-Office orders payable at Leyton High Street.
T. BALDWIN & SON, Edith Nurseries, Burchall Road, Leyton.

THE LARGEST STEAM HORTICULTURAL WORKS IN THE WORLD.

Telegrams: "CONSERVATORIES, LONDON."

Telephone: No. 4652.

AMATEUR GREENHOUSES.

SPAN ROOF.

THESE GREENHOUSES

are made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy man or gardener in a few hours. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, supplied with all necessary ironwork and stages for each side, and good 16oz. glass throughout. All parts securely packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

Deduct 10 per cent. if required for brickwork.

When ordering, it should be stated at which end the door is required (when facing front of house from outside); if desired, it can be inserted in front.

If William Cooper's Houses are not the Cheapest and Best Value for Money in the Trade, how is it he sends more Houses off in one week than any other maker in one year? Do not be misled by other makers copying my blocks and prices. Call and see the materials used, and the Houses being made. Works cover over 5 acres of Ground.

"INVINCIBLE" HOT-WATER APPARATUS.

Tenant's Fixture.

IMPORTANT.

I respectfully beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is now in preparation, and will be published in about three weeks, when I shall have much pleasure in forwarding to every person who has applied for a Price List up to August 24th of this year one post-free, and to all persons up to September 16th who send Three Stamps for postage, after which date the price will be One Shilling each, post-free. This List will be the most complete in the trade, and has cost several thousand pounds to produce.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.
Requires no sunk stovehole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the Greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all.

Securely and carefully packed on rail at the following respective prices:—

SIZE OF HOUSE.

7ft. by 5ft., £2 15s.; 9ft. by 6ft., £3; 10ft. by 7ft., £3; 12ft. by 8ft., £3 5s.; 15ft. by 10ft., £4 5s.; 20ft. by 10ft., £5 5s.; 25ft. by 10ft., £5 5s.

The following are extra:—Set of Stoking Tools, 2s. 6d.; Cap to Stove Pipe if required, 1s. 6d.

Estimates for complete Apparatus for any sized house, free on application.

GLASS.—GLASS.

10,000 BOXES TO SELECT FROM.

SATURDAY, SEPTEMBER 2, 1893.

THE WAYS OF THE ROSES.

MANY a curious chapter has been written on the idiosyncrasies of the genus "homo," and I think those who have gone through the world with their eyes and ears open could add from their own experience. I know of one lady whom three Strawberries would bring out in a rash. I know of a strong lusty man who is in a state of nervous prostration if a cat is in the room, and who has detected pussy's presence in his bedroom when everyone assured him that it was impossible. The great scholar, Erasmus, is, I believe, said to have fainted at the smell of fish. We have each, too, our own peculiar one, if we only knew it, and can recall many of those of our acquaintances; and as I have been acquainted with the Rose for many years, I should like to say a few words on her idiosyncrasies.

Of course, she leads a very artificial life (and so, as a matter of fact, do we); she is put out to nurse in her earliest babyhood; sometimes she clings very close to her foster-mother, but in some cases she repudiates the connection, and sulks, and gets into a bad state of health, ending often in death; thus, Tea Roses have altogether refused to have anything to do with the Manetti as their foster-mother. There may be a few that will endure her embraces, but the greater number of them languish and die. Well, this is apparently easy to be accounted for; the foster-mother is too strong for the more delicate bantling she takes under her charge, who cannot digest the strong food with which she is supplied so largely, and dyspepsia ensues, and the poor thing succumbs.

Another peculiarity is the manner in which some varieties differ in their behaviour in different localities; this came out amusingly before the National Rose Society's Catalogue Committee, when the description of the habit of the Rose was brought under discussion. Some one would suggest that it should only be described as moderate. "Moderate!" one member would say; "why, it is one of the strongest growers I have, and makes shoots 6 feet long." On inquiry, it was found that there was no difference in the stock or mode of culture; it must have had something in the situation that especially suited it. On the other hand, there are instances where some particular variety refuses to behave itself in anything like a seemly manner. Let me instance the case of a friend who grows Teas, as he does everything he attempts, to perfection, and yet there is one which is by no means a delicate grower, Rubens, which he cannot manage; he has tried it in all ways on half-standards, dwarfs, and standards. His plants grow vigorously, produce good shoots, show abundance of bloom, and yet he never has a flower worth looking at, all thin and poor; but the same grower had shoots of that somewhat

tender Rose, Comtesse de Nadaillac, as thick as one's little finger. I have observed these same peculiarities in my own small garden; thus probably we have, as a general rule, no stronger grower than Etienne Levet, yet it will never do anything with me either on the Manetti or Briar, while other H.P.'s do fairly well.

I am sometimes inclined to think that there are strains in some of our Roses in which either colour or vigour are more freely developed; I know this is the case with regard to Maréchal Niel, for Mr. Geo. Mount, of Canterbury, had one the buds of which he had obtained in the neighbourhood, which was distinctly deeper in colour than the ordinary type. In the same way, I have in my own garden plants of Comtesse de Nadaillac, which show a remarkable depth of colour. The climbing varieties, both of Teas and H.P.'s, give another instance of these peculiarities. Why should a plant of the delicate-growing variety, such as Devoniensis, develop a shoot some 20 feet long, and form thereby the foundation of a Rose of an entirely new character? I do not think that there is any explanation for this extraordinary freak [Reversion. Ed.]. Niphetos is a more vigorous variety than Devoniensis, and it, too, but in one instance, shows the same tendency, and Climbing Niphetos sent out by Keynes, Williams & Co., forms a valuable addition to our Tea Roses; but the extraordinary idiosyncrasy in connection with Roses is that which almost every season bears witness to. Every year there are some varieties, perhaps not more than two or three, which are everywhere good. It does not seem to matter what the soil, situation, or stock may be—in all cases, and in all parts of the country, fine blooms of these varieties are exhibited. This has been the case this remarkably trying year. In the class of Tea Roses, Marie van Houtte and Madame Hoste have everywhere been good, the former displaying wonderful beauty in its delicate creamy-yellow flowers, with the pink edging which so greatly adds to their beauty; while Madame Hoste, which many persons were inclined to look upon as too thin a flower, has proved itself to be a most valuable Rose. At the same time, other Tea Roses on which we have been in the habit of relying, noticeably Souvenir d'Elise, have been much below their usual standard of excellence. Amongst the hybrid perpetuals, that old and beautiful flower, Horace Vernet, has had a good time of it; it gained for Messrs. Harkness & Son, at the Crystal Palace, the National Rose Society's Silver Medal for the best Rose. Comte Raimband was another Rose that was well to the front; indeed, contrary to general expectation, the dark-coloured Roses, which it might have been supposed would have suffered from the fierce sunlight which has characterised this year, seems to have revelled in it, while other Roses lighter in colour do not seem to have fared so well; thus, for example, how very few good blooms of those two fine Roses, La France and Mrs. John Laing, were seen; one would have thought that it was a season that would have especially suited them. There were two or three other idiosyncrasies which also puzzle me. Why, for example, are some Roses so much more subject to mildew than others? For instance, take Her Majesty, probably one of the greatest offenders we have in this respect, so much so, that some of the growers give her a place entirely to herself for fear of her contaminating others, and yet neither of her parents are subject to it. Then, again, why are Abel Carrière and Jean Soupert so violently attacked by it, while other dark-coloured Roses escape scot-

free? Again, I find that some plants of some hybrids will always give autumnal blooms, while others of the same variety never do. Thus, among some plants of Gabriel Luizet there are a few which anyone looking at now would say that it is a summer Rose, while in the same row there are others which have a fair amount of bloom, and this peculiarity continues from year to year, the same plants always being flowerless in autumn, the others having always autumn bloom. With regard to orange fungus, there is also another strange fact to be noticed; however virulent it may be amongst hybrid perpetuals, it never seems to me to attack the Teas. Some years ago I was terribly plagued by this pest, and listened to the various suggestions which were placed before me to ensure its destruction. Of some of them I could say the remedy is worse than the disease; while of others, that they were perfectly ineffectual; then after a time it left me, and I have been very little troubled with it since. I may say, however, that I do not think it to be so injurious to the plants as some have imagined.

I have thus enumerated some of the idiosyncrasies which have forced themselves upon my notice during a long acquaintance with the Queen of flowers; there are others, I doubt not, which have suggested themselves to the minds of many rosarians. I do not pretend to give any reason for these things, and I very much question if even those scientists who are so omniscient can give us any solid reasons for them. These facts may not have much bearing on the practical management and culture of the Rose, but I think they are interesting, as indeed is everything connected with our favourite flower. *Wild Rose.*

NEW OR NOTEWORTHY PLANTS.

CATLEYA LABIATA MARGUERITE.

This is one of the most stately, and at the same time one of the most delicately beautiful of the numerous varieties of *C. labiata* which I have seen. The petals have a spread of 9 inches from tip to tip; the sepals and petals are white, with that delicate pink tint seen in the pearl, over their entire surface, except the mid-ribs of the petals which are silvery-white. The lip is also white, with a bright chrome-yellow base, almost devoid of the dark lines usually seen radiating from the interior of the tube. The fringed edge has the same pearly tint on the petals, and in lieu of the more or less developed crimson blotch on the front of the lip is a small feather-like mark, composed of about ten crimson lines in front of the before-mentioned chrome-yellow centre of the lip. It is of the Gaskelliana alba section, and many would think it even more beautiful than that variety. It flowered with Joseph Broome, Esq., High Sheriff of the County of Carnarvon, at his charming home, Sunny Hill, Llandudno. Mr. Broome is an amateur of great experience, and is a clever grower of Cattleyas and *Laelias* especially. It is named after his little daughter. *James O'Brien.*

STREPTOCARPUS CROSSES.

The series of Gloxinia-like plants, for which we are mainly indebted to Mr. Watson of Kew, is progressing both in variety and in popular favour. They are the outcome of the cross-fertilisation of *S. Rexii* by *S. Darnii* and others, so that now, after the fashion of florists' flowers, their parentage is very much mixed. The result is an increased variety in colour, larger and more numerous flowers. How well they are suited for cut flowers was illustrated by the use made of them in one of the competitive classes at the Agricultural Hall this week. The history of these plants is written in the *Gardeners' Chronicle*, July 30, 1887, p. 137. *S. Watsoni* ×, a variety with rosy-purple flowers, is figured in the same volume, August 20, 1887, p. 215.

ORCHID NOTES AND GLEANINGS.

BLETIA SHEPHERDII.

BLETIAS are not in fashion at present, or this would be thought more of than it is. Although known in cultivation for many years, it is still uncommon, but we were pleased to see it in the nurseries of Messrs. Jas. Veitch & Son, at Chelsea, lately. Its elegant sprays of flowers were about 2 feet in height, each flower $1\frac{1}{2}$ inch across, and of a beautiful violet-purple colour.

THUNIA PULCHRA.

This is one of the most floriferous of the species, and although the individual flowers are not so large as those of *T. Marshalliana*, their quantity and the graceful manner in which the inflorescence displays itself, compensates for that defect, if one it be. The flowers are white, the labellum streaked and tinged with chocolate colour. Like all the other *Thunias*, it requires a resting period in a cool situation after the leaves have fallen, it being kept dry at the root the while. It was in flower recently in the nurseries of Messrs. Jas. Veitch & Son, at Chelsea.

ARACHNANTHE LOWII (VANDA LOWII).

A very fine plant of this remarkable Orchid is in flower at Messrs. F. Sander & Co.'s nursery, St. Albans. It has seven long drooping racemes of its extraordinary dimorphous flowers, over 300 in all. Its ordinary flowers are of a very bright shade of deep red, with some yellow spaces between the blotches; the odd flowers nearest to the plant being rich bright yellow, with some crimson spots. One of the spikes, in addition to the two bright yellow odd flowers, has another almost intermediate in form and colour between the two sets of flowers—the ordinary and the basal ones. The plant is in fine health, and is stated to be second only to the famed *Ferrierea* specimen. *J. O'B.*

ODONTOGLOSSUM EDWARDI.

This is a robust-growing evergreen plant, making pseudobulbs and leaves of about the same deep green colour, and producing a strong branching spike of bloom. The individual flowers, however, are small, measuring only about an inch across; but they are numerous, and yield a delicious perfume, whilst the colour is rich purplish-mauve, which renders it very conspicuous, and distinct from all its kindred. We are unable to state at what altitude it was found, but we presume that it grows at a considerable elevation above the level of the sea, for we have found it to thrive best when treated quite cool, and we therefore advise our readers to keep it at the coolest end of the *Odontoglossum*-house, potting it in good upland peat fibre, mixed with some fresh and growing sphagnum moss. The pots should be well drained, for it likes an abundance of water to the roots when growing, and means should always be provided for this to pass away quickly, and a nice moist atmosphere should be maintained; in fact, the plant should never be allowed to become quite dry at any season, although, as a matter of course, very much less water is necessary in the winter months than is required during the spring and summer. Some slight syringing will also be advantageous during the dry hot weather, but it should be done very carefully with a fine rose, and just enough water should be used as will fall upon the plants in the form of a gentle dew. *Orchid Album*, vol. x., part 117.

CYMBIDIUM EBURNEUM.

Much has been said and written about this species and its requirements, but nearly all that was formerly advocated as necessary for this plant is now open to objections, as nearly all the growers in the early days erred in giving it too much heat, and in keeping it too dry through the resting season. In potting it should be remembered that it is a plant which makes stout and fleshy roots, and in great numbers; and it requires plenty of space to allow the roots to ramble. The pots, too, must be well drained to ensure sweetness, which can never be attained if water is allowed

FIG. 47.—STREPTOCARPUS CROSSES: COLOURS WHITE, LILAC, ETC. (SEE P. 261)

to stagnate in the pots. The soil should consist of good turfy loam, three parts, and fibrous peat, sphagnum moss, and sharp Bedfordshire sand, one part of each, and they should be potted as ordinary fine-leaved plants, leaving sufficient space for a good supply of water. The *Odontoglossum*-house will suit it admirably during the greater part of the season, but as it begins to move, about the beginning of the year, it may be removed into the *Cattleya*-house; treated in this manner the plants will not be subject to the spot on their leaves, which need to be such a great disfigurement to them. *Orchid Album*, vol. x., part 117.

NURSERY NOTES.

MESSRS. WALSHAW AND SONS,
SCARBOROUGH.

VISITORS to this fine watering-place, who are interested in the cultivation of plants and flowers, should not fail to inspect the well-kept establishment of Messrs. Walshaw & Sons. The North of England is not behind-hand in the advance that has been made in horticulture during the last twenty years, although a vast amount of southern produce is still required to meet the demand. This firm is actively engaged in extensions of the usual market type, and I had much pleasure in seeing the improvements lately made in this very old-established business. Twenty houses filled with *Solanums*, *Bouvardias*, *Ferns*, *Gardenias*, *Eucharis*, *Palms*, *Aspidistras*, *Liliums*, &c., are a sufficient indication that a lively business is being done. Carnations are well done, both in and out-of-doors, and at the time of my visit (August 14) the operation of layering, which had been daily carried on for the past three weeks, had been just finished; it is a tradition of the firm that all layering must be finished by the first week in August.

Chrysanthemums seemed to fill up every atom of space available, the leading varieties being *Lady Selborne*, for early work, and *Mlle. Lacroix* for late cutting; *Mons. W. Holmes*, *Source d'Or*, *Margot*, and *Cullingfordii* are the favourites amongst the coloured ones. I was particularly struck by the perfect health and cleanliness of the plants, which betoken careful and efficient attention on the part of the employes.

The annual bulb importations were just beginning to arrive, which reach a large amount each year, as, in addition to their own requirements, the firm do a wholesale and retail trade. The advantage of proving their purchases by growing large quantities themselves must be an advantage to them.

A glance round the outside stock soon shows what is required in seaside planting. *Aucuba japonica*, *Euonymus*, broad-leaved *Hollies*, and *Berberis*, are the shrubs that are found to do the best, and these are largely grown. To give full scope to the outside stock a branch nursery has been established at *Scalby*, a village about three miles away. Here there are under cultivation several acres of *Roses*, *H. P.* and *Teas*; *Daffodils*, *Conifers*, &c. Nothing could be finer than the *Roses* this year; there are in 30,000 in number, evidently thoroughly suited with soil and situation, and they will help to extend the already good reputation of the firm. *Bailey Waddis*, *Birdsall Gardens*, *York*.

SUNNINGDALE PARK, BERKSHIRE.

THE residence of Major W. J. Joicey, is situated in beautifully undulating grounds some 112 acres in extent, and naturally clad on the higher ground with *Pine trees*, beneath which the *Bracken* and purple *Heather* flourish, their beauties supplemented by plantations of *Rhododendrons*, *Hydrangea paniculata*, and other flowering shrubs, which grow most luxuriantly. The surrounding of *Pine trees* serves admirably to enclose and to protect the gardens from the keen winds, and also to lend an additional

charm to the walks under their shelter by the pleasant and healthy odour they emit. It is not yet three years since the gardener, Mr. Fred. J. Thorne, had instructions to carry out the beautifying and developing as a modern garden this naturally pretty place, and already has he accomplished a great deal towards attaining that end, and that, too, without interfering with the sylvan beauty of the place, or its noble *Beeches*, *Oaks*, and *Spanish Chestnuts*, which form such grand objects when viewed from the high ground of the terrace in front of the mansion.

The estate is rendered as complete as possible, inside the main lodge gates being the stables, electric lighting buildings, fire-engine station, and further on capital accommodation for about a score of gardeners. Then we come to the plant and fruit houses, and the fact is soon revealed that utility is the order of the day, and that plants which give good supplies of cut flowers for all seasons, and plants for table and indoor decoration, and fruits of all kinds have to be forthcoming in quantity. As one of the most useful classes of plants for giving cut flowers of lasting quality, the *Orchids* have been taken in hand, and have proved so satisfactory that their culture is to be extended. Several very fine and well-built ranges have been constructed for them, and the vigorous condition of the occupants of all of them speak much for the aptitude with which Mr. Thorne treats them collectively and individually. In the first large span-roofed structure of three divisions, the first division was filled with *Orchids* in flower, among them being the beautiful new *Miltonia* × *Joiceyana*, some new hybrid *Cypripedium* (*barbatum* × *belligerum*), very fine and richly coloured; many *Cattleya labiata Gaskelliana*, *Dendrobium Dalhousieanum*, grandly flowered; *D. O'Brienianum*, a very singular though not a showy species; *Calanthe veratrifolia*, and various *Cypripediums*. Here the *Anguloa Ruckerii* and other *Anguloas* grow splendidly, some of the plants in 7-inch pots having borne over two dozens of flowers. In the next division is a finely-flowered plant of *Vanda Sanderiana*, for which a Cultural Commendation was awarded at the last meeting of the Royal Horticultural Society; some *Cypripediums*, among which were *C. Sedeni candidulum*, *C. oeanthum*, and a new hybrid, *C. Dayanum* × *superbiens*. In the third division *Staurosis lissochiloides* (*Vanda Batemanni*) is in bloom, so also *Cynochos ventricosum* and other interesting plants. In the *Odontoglossum*-house, the plants are in splendid condition, among those in bloom being *O. Uro-Skinneri*, *O. Harryannum*, a good specimen of the scarlet *Epidendrum rhizophorum*, several of the elegant *Oncidium incurvum*, *Dendrobium cariniferum*, one of the neatest, although not one of the showiest of the nigro-hirsute *Dendrobiums*, and various other species.

In the other *Orchid*-houses we noted in bud a lot of the new *Cattleya Alexandra*, *Dendrobium Pannanopsis Schroderianum*, which grows here splendidly in a moist warm house, and flowers profusely, one of the plants having five spikes; a batch of *Miltonia vexillaria* in a very vigorous condition, as indeed all the plants are.

In the other plant-houses, we found a splendid lot of brightly-coloured *Crotons* and *Dracaenas* of all sizes; a fine batch of *Poinsettias*, a number of *Hydrangeas*, which are here grown to bear heads over 2 feet across; a good lot of *Ferns*, principally for cutting; *Pancretiums*, *Eucharis*, *Vallotas*, and climbing *Allamandas*.

The fruit-houses comprise some extensive ranges of *vineries*, *Peach* and *Nectarine*-houses, &c., and all are in good condition; the existing crops, especially of *Grapes*, tell of former and future plenty.

The kitchen gardens are rendered bright by herbaceous and annual flower borders, the *Zinnia* being magnificent. The season has been a trying one on this dry gravelly and sandy soil, but Mr. Thorne says that he has managed better than he expected to keep up the supply, and has a good prospect for produce for winter and spring. *Apple* and *Pear* crops are light here, but most other fruits have been abundant. The furnishing of the walls has

been very cleverly managed, and indeed all the work done is thoroughly carried out so as to be a permanent benefit.

THE WORLD'S FAIR, CHICAGO.

(From our Special Correspondent.)

AFTER the *Rhododendrons* were over, the island was bright with *Pæonies*, H. Cannell & Sons, of Swanley, Kent, having a very good bed. They showed some of the best varieties, rich especially in light colours. Ellwanger & Barry, Rochester, N.Y., made a good *Pæony* display, as did Masara, Pitcher & Manda, of Short Hills Nursery, New Jersey, U.S.A., and several Dutch firms.

The *Rose* garden was quite attractive in June, but it did not, at any time, really meet my expectations. The best show, when the *Jane Roses* were all in bloom, was made by Alex. Dickson & Son, Newtownards, Ireland. Their new *Margaret Dickson* did not show to great advantage, and was disappointing, though we hear its praise from other places in America. But their *Baroness Rothschild* were very good, and their bed of *Mosses* excellent. A number of standards were shown on the Island by Dutch and German exhibitors, the French standards being arranged near the *Woman's Building*; but plants of this style do not continue to do well in our climate, and are not admired. The Associated *Dræden Gardeners* have some good beds of *Teas* and *H. P.'s* and they have been flowering freely. The American exhibitors have really made more show with *Teas* than any other class. Mr. J. C. Vaughan of Chicago makes a good show of the pretty *Polyantha Clothilde Soupert*, which blooms freely. Among *H. P.'s* Mrs. John Laing is the very best here; it has produced more flowers, and is of uniformly better quality than any other hybrid perpetual shown. The soil in this *Rose* garden is light, hungry, and dry, exposed to sweeping winds, so we can hardly wonder that it failed to produce the show we wished.

Just now the *Phloxes* are very showy, most of the *Pæony* beds are hidden by them. Messrs. H. Cannell and Sons have a fine bed, including a number of varieties; I should divide the honours between them and Messrs. Ellwanger & Barry, Rochester, N.Y. The last-named firm has a very excellent white *Phlox*, *The Queen*, which in a large mass is very fine. A number of other firms have planted *Phlox*, but the plants are not in masses, and do not show so well as those named. The *Boskoop Nursery Association* have four beds of *Clematis* in the centre of the *Rose* garden; among them *C. viticella venosa*, *C. Jackmanni*, and *C. J. alba*, *Duchess of Teck*, and *Thunbergii* flowered very freely.

At the present time (August 8), the hybrid *Gladioli* exhibited by V. Lemoine et fils, Nancy, France, are blooming well in beds north of the horticultural building. The large size of these flowers, and their rich colours and markings, make them very noticeable; and it must be confessed that but for them the *Gladioli* exhibit would be below the level of mediocrity.

We had a very interesting group of *Gloxinias* in one of the model houses devoted to the New York State exhibit, well grown plants of an excellent strain, but after reading recently in an English gardening paper of *Gloxinias* with 100 flowers or more to a plant, I begin to fear ours are not very remarkable. In the same house were some good tuberous *Begonias* which promised well, but they were attacked by disease in July, and are not yet recovered.

The lawn in front of the Horticultural Building is now occupied by dwarf *Cannas*, which have replaced the *Pansies*. Most of the beds are planted with one sort only; some of those now in flower are *Madame Crozy*, *J. D. Cabos*, *Captain P. de Suzzoni*, *Statuaire Fulconis*, *Alphonse Bouvier*, *Miss Sarah Hill*, and *Florence Vaughan*. The exhibitors are Messrs. F. R. Pierson Co., Parrytown, N.Y.; Messrs. Pitcher & Manda, Short Hills, N.J.; Mr. H. A. Dreer, Philadelphia; Mr. Robert Craig, Philadelphia; and Mr. J. C. Vaughan, Chicago. They are making a fine show.

A basin of *aquatics*, in front of the large building, is now bright with the *Water Poppy*, and a number

of *Nymphæas* are showing bloom. This pool is filled by Wm. Tricker, Dongan Hills, N.Y.; while a large basin in the south court of the Horticultural Building is filled with aquatics by E. D. Sturtevant, Bordentown, N.J. Peter Henderson & Co. of New York exhibited aquatics in one of the New York greenhouses, including some of M. Marliac's *Nymphæas*, which are largely used in the Chicago parks. In this aquatic-house a large plant of *Aristolochia gigas* var. *Sturtevanti* has been flowering freely for some time; its huge ill-smelling flowers excite much wonder. Another oddity in the Horticultural Building is a plant (not living) of *Welwitschia mirabilis*, which, I believe, is to be seen at Kew, but unless it

is considered among them. Besides its undoubted beauty as a flower, it is interesting as being the first hybrid which has been obtained from the remarkable *C. Rothschildianum*; and it is hoped that it will not be the last which will emanate from the careful operations of Mr. C. Maynard, who is the Seden of Messrs. Sander & Co.'s establishment at St. Albans, and in honour of whom *Lelio-Cattleya Maynardi* is named. As will be seen from the sketch, the flowers are of a good size, the upper sepal being pale yellow, with dark purple bands running from base to apex, and somewhat feathered at the margins. The lower sepal is similar, and the fringed petals are also pale

numerous, while bulbils are formed so profusely in the axils of the pinnae, and develop so rapidly into little plants if the fronds be layered, that we have at once the cause of its varietal name, and that of its prevalence in trade hands, its propagation being of the easiest. The perfect hardiness and thoroughly evergreen character of the family render all its varietal members peculiarly adapted for pet-pot-plants; and though they certainly lack the annual charm of flowering plants, yielding no crop of brilliant-coloured blossoms, yet in many of the varieties the circle of rising fronds in the spring, covered with dense snow-white and pale-brown scales, each frond gracefully uncoiling backwards in the form of a crozier, forms a harvest for the quiet eye which is by no means to be despised. Outside this lies the additional charm of immense variety of form and make, and even size, which enables the true *Polystichum* fancier to put side by side an enormous plant, with dense yard-long fronds spreading laxly all around like a gigantic vegetable star 6 feet and more across, and a tiny gem of that identical species which, though fully grown, will be roomily housed in a thumb-pot—*P. a. Lyellii*, to wit. Between these two extremes there are all grades, and among these grades an infinite additional range of form in the shape of varied modes of subdivision, the mitten-shaped pinnules of the normal type being expanded and contracted and modified in a thousand ways, while the fronds in many cases possess additional characters in the way of tasselling, greater or less attenuation or congestion, and so on *ad infinitum*, so that independently altogether of minor varieties, which only an expert could pronounce as such, there are some hundreds of widely differentiated forms of much more ornate character than the common, the special characters of which, as the French say, "jump to the eyes." Undoubtedly the most beautiful of these are the "plumose" or extra-feathery forms, in which the normal plan of the species is merely elaborated to the utmost by constant subdivision.

In the Holly Fern (*P. Lonchitis*) we have the simplest form of the species, i.e., a midrib to which, on each side, a row of quite undivided mitten-shaped bristly pinnae is attached, each of which somewhat resembles a Holly-leaf, whence the popular name. In the hard Shield Fern (*P. aculeatum*), in its young state, *P. Lonchitis* is so closely imitated, that it is often confounded with it; but as the plant develops, the lobes or pinnae split and form others on the same "mitten" plan, so that in adult normal plants of this and its congener *P. angulare*, the soft Shield Fern, the pinnae or secondary divisions of the frond are like the whole frond of *P. Lonchitis*, and represent thus the first stage towards the plumose, in the finest of which *P. a. divisilobum plumosum densum* (Jones and Fox), division to the fifth stage is actually reached, so that each "mitten" is resolved into hundreds of long slender silky divisions, which, in the plant cited, so densely overlap each other that the frond appears to be built of the finest moss, and the entire plant forms a gem of vegetative beauty, which once seen is not soon forgotten. This wonderful Fern and its sister plants, *P. ang. d. p. Baldwinii*, *laxum*, and *robustum*, sported at one stride from a wild find of very inferior type, and hence are not as most people would imagine the outcome of a long period of selective culture. Curiously enough, a fifth splendid form, *imbricatum*, the densest of all, and much tougher in texture than the others, was raised by Mr. Lowe from a bulbil of *densum*, establishing thus the possibility of secondary sports through bulbils as well as spores. Undoubtedly one of the chief reasons why the great bulk of the varieties of this charming species are *caviare* to the multitude, is the length of time which they demand for development from the spores, fully two years being required under the most favourable conditions before a decent characteristic plant can be so raised. Nurserymen, therefore, with few exceptions, ignore them, and the consequent fact that they are not popularly advertised or exhibited for sale has its natural corollary in a general ignorance of their very

FIG. 48.—*CYPRIPEDIUM* × *MASSAIANUM*.

is present in some botanical museums, this is its first appearance here.

A quantity of very fine forced Lily of the Valley, from pips kept in cold storage, is one of the present attractions.

Mr. Geo. Nicholson, of Kew, and Prof. Dr. L. Wittmack, of Berlin, have been in Chicago recently, acting as jurors in the horticultural section. They attended the convention of the Society of American Florists, at St. Louis, where they were received with much enthusiasm, and will attend the Horticultural Congress in this city the week following the St. Louis convention. *E. L. Taplin, Chicago.*

CYPRIPEDIUM × MASSAIANUM.

ALTHOUGH it must be admitted that many hybrid *Cypripediums* are only fit to be relegated to that "heap" usually associated with the sufferings of the patient Job, still there are many worthy of a better fate, and *Cypripedium* × *Massaianum* must be con-

sidered among them. Besides its undoubted beauty as a flower, it is interesting as being the first hybrid which has been obtained from the remarkable *C. Rothschildianum*; and it is hoped that it will not be the last which will emanate from the careful operations of Mr. C. Maynard, who is the Seden of Messrs. Sander & Co.'s establishment at St. Albans, and in honour of whom *Lelio-Cattleya Maynardi* is named. As will be seen from the sketch, the flowers are of a good size, the upper sepal being pale yellow, with dark purple bands running from base to apex, and somewhat feathered at the margins. The lower sepal is similar, and the fringed petals are also pale

THE SHIELD FERNS AS DECORATIVE PLANTS.

To all intents and purposes, the only form of Shield Fern (*Polystichum*) popularly used for decorative purposes, and distributed generally by horticultural tradesmen, is the common bulbiferous variety known as *P. angulare proliferum*, Allchin. This is distinguished from the normal Shield Fern by bearing much longer and more tapering fronds, the subdivisions of which are very attenuate and

John Weathers.

existence. Of late years, however, much has been done to extend the popular acquaintance with this and the other British species, and notably the marvellous Kew collection has contributed materially to this desirable end.

The Royal Horticultural Society for several successive years has held exhibitions at Chiswick and Westminster, where hundreds of the finest types have been worthily represented, the Shield Ferns especially holding a foremost place among the species shown. What we want now, in order that a still wider popular knowledge should be spread, is the establishment of some fairly representative collection of our native Ferns in our public parks and gardens. Already, in one of our small East-end parks (West Ham), a long range of rockwork is devoted to some hundreds of the choicest types; but here, alas! it has not been deemed advisable to carry a path in close proximity, for fear they should be stolen, and hence a stretch of untrodden grass intervenes as a barrier between the Ferns and the public, and renders the collection useless. Now, in Hyde Park, at the eastern end of the Serpentine, there is an ideal station for a very host of British varieties, and we would ask, to what better use could such a position be devoted than the display of a number of beautiful native plants, the natural offspring of our own hills and valleys, and in the production of which we Britishers stand *facile princeps* in the whole world. A few hundred plants, embracing the best forms, could be installed there at small cost, and form not only "things of beauty," but also "joys for ever," throwing up their feathery verdure in perennial profusion when once congenially installed. We hope this suggestion may meet the eye of some one in authority, and bear the fruits we long for.

At Clifton, in the Zoological Gardens there, the late Colonel A. M. Jones added one of the chief attractions by planting out the bulk of his splendid collection in beds, sheltered by shrubs such as Azaleas, Rhododendrons, &c., which lost nothing of their own individual charms by being associated with the plummy Ferns which occupied the foreground. Here the Shield Ferns took, as ever, the most prominent place, since Colonel Jones and his colleague, Mr. E. F. Fox, were before all things, Polystichum fanciers, and many of the gems jointly raised by them found their way thither. Among these were, and presumably are, many examples of that "crossing," the possibility of which has of late years been practically demonstrated by the production of a number of mixed types in which the leading characteristics of two quite distinct varieties were most unmistakably commingled, divisilobes, multilobes, and denticlobes being furnished with tassels by being sown together with tasselled varieties, and it is very curious to observe in some of these that the peculiar influence which produces the tassel or crest is often alone transmitted, the shape or make of the frond not being otherwise affected. To illustrate this, an attenuate form known as *P. ang. lineare*, Tait, with very narrow pinnules, was crossed with a polydactylous form with normal pinnules; the result is Tait's form exactly, plus polydactylism, the narrow pinnules not being altered in the least towards the normal. In the present state of our knowledge in re-crossing of Ferns, we cannot say which is really the mother prothallus, and it is possible, therefore, that Tait's form was so prepotent as to obliterate the normal character of the pinnules of the polydactylous form, the "lineare" being the male. On the other hand, the polydactylous form used seemed to possess a peculiarly strong power of crossing others, a very large number of forms having been influenced by it, and as it is an imperfect type, i.e. irregular, and precisely the same irregular character is seen in all the crosses, its influence is very distinctly traceable.

Some idea of the immense versatility of this species may be gathered from the fact that Mr. E. J. Lowe, in his recently-published list of *British Ferns*, describes no fewer than 428 varieties, viz., 34 of *P. aculeatum*, and 391 of *P. angulare*, of which by

far the major number were found as wild sports, chiefly in the south-western counties of England. To attempt within the limits open to us to describe these would be altogether vain, and we can therefore only refer those who are interested to such lists and catalogues as are published and advertised; suffice it to say that, while as we have seen, there are splendid robust forms which would be conspicuous central ornaments for large conservatories, others of equal beauty in their way are so diminutive, that a decent collection might be spaciouly housed in a single north window, a situation indeed where, in thousands of dwellings, pot-plants of the Shield Ferns would find a congenial home, and afford a fund of inexhaustible pleasure to the cultivator. If carefully sheltered from the weather, as they would be in such a situation, they remain perfectly green throughout the winter, the old fronds only drooping when the new ones have asserted themselves. Culture is of the simplest; loam and leaf-mould half-and-half, with a dash of sharp sand, forms the compost; drain the pots well, and during the winter see that they do not get dry, since in their natural habitat they are usually thoroughly soaked when not frozen. *Chas. T. Druery.*

BOOK NOTICE.

THE WORK OF THE SOIL, AND ITS NITRIFICATION, by Mons. P. P. Dehérain (*Comptes rendus des séances de l'Académie des Sciences, t. cxvi.; séance du 15 Mai, 1893*).

THE author says it is more than fifty years since Liebig taught us that cultivated soils contain considerable quantities of organic substance. Ordinary arable clayey soils in fair condition of fertility, when all vegetable roots have been removed, will contain, in the first 9 inches of the surface-soil, a quantity of organic matter containing about 3000 lb. of nitrogen, and 30,000 lb. of carbon per acre.

When we remember, therefore, that full crops of many of our cultivated plants only need from 100 to 150 lb. of nitrogen per acre for their successful growth, it is somewhat surprising to learn that with the large store of organic nitrogen in the soil, we find it necessary to add nitrogenous manures at all, yet the efficiency of nitrate of soda and sulphate of ammonia as fertilisers has long ago been abundantly proved.

Boussingault showed us that, in fact, the nitrogenous matters of arable soils are usually inert and inactive for plant-life, their oxidation and nitrification being too slow to subserve the requirements of the multitudinous individuals that make up the crops of a farm or of a garden; hence, the soil left to its own resources is unable to satisfy the demands made upon it. Even with an abundant dressing of farmyard manure, certain soils may still remain unproductive owing to the non-nitrification of its organic matter.

We get a pretty correct idea of what takes place in a soil in regard to nitrification from an analysis of the drainage-water percolating through it. The author found in 1891 that various soils that had received a copious manuring with about 21 tons per acre of farmyard dung, allowed the following quantities of nitric nitrogen to drain away. For comparison is also given the amount of nitric nitrogen percolated through unmanured soil.

Nitrogen as Nitrates in Drainage Water.

Seasons.	Quantities in lbs. per Acre.	
	Dunged Soil.	Unmanured Soil.
Spring	46.1	19.5
Summer	22.2	13.5
Autumn	38.2	28.3
Winter	17.4	13.5
Yearly total	124.3	71.8

The total quantity of nitrates formed in the soil is thus seen to be considerable, ranging from nearly

75 lb. in the unmanured land, to more than 124 lb. in the dunged soil. But it may be well to note that the whole of this nitrogen is not available to our ordinary cultivated crops, for the reason that many of them only assimilate the spring or early summer nitrates, the principal growth and power of assimilation having ceased by the month of July.

Root-crops, such as Potatoes, Beetroots, and Turnips, may still get hold of summer nitrates, but the nitrates produced in autumn and winter are of little use. The spring nitrification alone is, as a rule, quite insufficient; hence the use of increasing quantities of nitrogenous manures.

The author being anxious to ascertain if it was possible to excite in our cultivated soils during the period of spring-time a sufficiently active nitrification, so as to avoid the great expense of these artificial manures, a series of experiments was instituted with soils obtained from different districts of France to determine the point.

From the results obtained, the following conclusions were drawn: Trituration or pounding of the soil is a powerful method for causing active nitrification.

In making preparation for winter, soils should be dug or ploughed, and left in a rough condition, with the clods unbroken. There ought to be no trituration if the soil is to remain uncovered during the winter, the breaking up of the soil-particles causing active nitrification, which must be absolutely hurtful, the nitrates formed being dissolved, carried into the drains or lower sub-soil and lost.

With the return of spring, seed-sowing begins. Trituration should then be as complete as possible, all known methods for pulverising and crumbling the soil being adopted.

During the growth of the crops the hand or horse-hoe should be vigorously used, for it was found that the weight of Beet roots obtained was in proportion to the number of cross-ploughings the land had received.

We may mention that in three soils at Rothamsted, Hertfordshire, in fair agricultural condition, cultivated as bare fallow since the harvest of the previous year, 56.5, 58.8, and 59.9 lb. of nitrogen as nitric acid per acre were found in September or October, to a depth of 27 inches. Also the soils of the various plots in the experimental Wheat-field at Rothamsted were sampled in October, 1881, to the depth of 27 inches. There had been much rain after harvest, and the conditions were very favourable to nitrification. The nitrates were chiefly near the surface, the distribution in the three depths, each of 9 inches, being, on the average, as 100, 59, and 31. The quantity of nitrate found generally bore a distinct relation to the quantity of the preceding crops. It appears that the nitrogen of permanently unmanured land nitrifies with more difficulty than the nitrogen of land that has yielded large crops, or has received farmyard or other organic manure. *J. J. Willis, Harpenden.*

TOURING IN KUMAON.

(Continued from p. 239.)

KUBCOTE.—Soon after we arrived at the little Dak bungalow of Kubcote, and halted for the day, having done about 14 miles in a very leisurely way. This is the last Dak bungalow I expect to see. I and my little cavalcade left early the next morning for a place called Shama, supposed to be some 15 miles ahead, the road still running beside the Surgu. Some exceedingly pretty pieces of river scenery were noted on the road. After going about 5 miles, unfortunately I mistook Loharkhet for Loharghat, and consequently went about 7 miles out of my way on the road for the Pindari Glacier route; but no great harm was done, for on the way to Loharkhet some very good scenery is to be seen, and one particularly fine view of another river. Immediately after crossing the bridge over the Surgu for the Loharkhet and Pindari Glacier route, we began a winding steep ascent, and as I rode ahead, I could see my men coming up with their loads, and appa-

rently going deliberately down hill and away from me. I mention this to show how steep and winding the road was to produce such an illusion. After 3 miles, we came to a couple of enormous hills, nearly all rock, of great height, and coming down at the base nearly perpendicularly, and so close together that, looked at half-a-mile off, it would appear as though the road went to the hills, and no further; but when we arrived on the spot, it was seen there was just room for a small road and the river to pass between the bases of the two monster piles. Here the river is very rugged, and full of giant boulders weighing many tons apiece, and the vegetation is rank and moist. The last mile to Loharkhet is very tantalising; it goes up a very steep hill, and is very zig-zag, with about one hundred turns in it. At last we reach the top, and halt for a rest. Here I learnt my mistake, and further that five gentlemen had been that way in October last. So, after two hours' rest, I decided to go back to the Surgu bridge, near the other road, and camp there close to the river for the night. This was decidedly a hard day's work; when we arrived at our destination, 21 miles had been covered. About half-past six the tent was up and fires alight, and dinner on the road. I bought an excellent large lamb or half-sized sheep for 1s. 10d., some good honey, and a large kind of Pumpkin. The natives call the latter Kuddus. When nicely cooked they are nearly undistinguishable from Vegetable Marrows. These with soup and sundries made up quite an enjoyable dinner after the fatigues of the day. There is something remarkably satisfactory in camping out like this, and taking your dinner under the brilliant starlit heaven, and the roaring river only fifty yards away.

I rose the next morning at 4.30 A.M., and by 5.30 A.M., we were on the road for Shama, which ought to have been my destination the day before. Here on this part of the road we met miles of sheep and goats. The Bhootias, I learnt, were going home, and taking back a good load of Rice; these men are practically barterers, and do a lot of exchanging; they go down with borax, and come back loaded with Rice, salt, and sundries. On the road beside the river were many more trees loaded with Orchids, in every way similar to those noted further back. I have seen it stated that Orchids will not grow on dead trees. There is an instance along this road to the contrary—a large tree, manifestly it has been dead for at least five years, if not more; not a vestige of bark is left, and not only that, all the branches have fallen off through sheer rot, but on the top of the trunk, about 40 to 50 feet high, there is quite a large Dendrobium, not looking happy, it is true, but unmistakably alive.

Following the course of the river, we halted for breakfast, after doing ten miles. From this point the road begins to ascend very sharply. The Surgu is crossed. After doing some 5 miles, the real top of war comes in; even my excellent Bhootia pony can go no further, for we have to leave the Government road and take to a very narrow path that in the first instance goes over a hill some 11,000 feet elevation. Our object for the time being is to get on to a small flat some 2 miles up; and indeed it is up—those 2 miles were more like the roof of a house than anything else, and when we did arrive, everyone was tired out. One of the most remarkable things, however, is the way one gets over this kind of thing. In less than an hour my men were putting up the tent, collecting wood and water, and generally settling about business for dinner. The magnificent forests of this neighbourhood are very striking. These forests contain numerous wild animals, notably three kinds of deer, but the gradients are so very steep and dangerous it is almost impossible to get at them. The next day we moved on some few miles further up, still very steep; here we are 13,000 feet elevation, and the air is getting distinctly fine and light. The stupendous character of these mighty hills can be seen for hundreds of miles. How sublimely beautiful, too, is the sunlight on the snow-peaks as it goes down. Two days after this we were at the base of the Namic glacier, nearly 16,000

feet above sea-level; the air is exceedingly fine. I must not omit to mention that the Rhododendrons are totally unlike those of Ramghur and Kumaon in general; here they are very stout shrubs, reaching to the ground much as they do in England, but the branches are very strong and stout, and the outline of many of the plants are most perfect; unfortunately none were in bloom, but my friend Mr. J. G. Bellairs, of the Berenag Tea Company, who has seen them in full bloom, tells me they are a very lovely sight, many of them being as white as snow. I stayed in this place two days, and have nothing but delight to record about it. From a small place called Leti there is an exceedingly narrow, precipitous pathway, going to a large village called Munsharee, about two days distant, but as my men were heavily loaded, and the path was exceedingly steep in places, I did not care to venture that way, and so made up my mind to go the same way back as we came. I was anxious, if possible, to reach a place called Tajum, some 20 miles due east, but the descent was a stupendous one. I knew in advance I had to get down from 16,000 to about 4000 feet, so I rose about 4 A.M., and by 5 A.M. we were on the move, just as the brilliant light of the rising sun could be seen coming up below the horizon, and being a good climber myself both up and down hill, we got down in quick time to the Government road, reaching there about 1 o'clock. I urged my men on to reach the road before breakfast, and we did so, but it was no light work. There are numerous places where the slightest false move would have sent anyone rolling down places more than a mile deep, and with slight chance of stopping before the bottom was reached. Having reached the Government road, we halted three hours, and then pursued our way to Tajum, some 6 miles further on, but still a stiff down gradient the whole way; this we reached about 4.30. By the roadside is plenty of perfectly flat camping-ground, nice and grassy. Fifty yards off is a very powerful river, the Rangunga by name. This river represents the accumulative force of the many small rivulets coming down from the snows in this direction. The sun is positively hot. In front of us was a marvellous hill of great height, magnificently clothed with semi-tropical forest, and withal, nearly perpendicular. The air was so delightfully warm and balmy, that I at once donned a light woollen dressing-suit, and, armed with a towel, I made for the Rangunga, and soon took a plunge into about 20 feet of magnificent water, so transparent that every stone could be seen at the bottom, and the wonder was that I ever got out alive. Very foolishly, I quite forgot my nearness to the snows, and the rate at which the water was travelling, and consequently, it was absolutely icy-cold. It soon got about a Sahib had come, and consequently several natives turned up, and caught quite 50 lb. of splendid fish, which I had no difficulty in buying for 6d., and for 3d. I gave all my men as much as they could eat of excellent fish; here, too, I had the luck to shoot a brace of large pigeons, and so we were very well off for food. The next morning I woke about 4 A.M., more surprised than pleased. I had intended starting about 6 A.M., but everything was perfectly saturated with moisture, even inside of my double Cabal tent, and notwithstanding I burnt a good lamp all night, everything without exception had a fine deposit of dew on it, and all the guns were rusty. So soon as I got my clothes on I went outside, and could not see 1 yard for vapour. As the sun got up the vapour cleared, and my cook found his way to my tent, and said in Hindostani, "Sahib, everything is absolutely wet through, what are we to do?" "Wait till ten o'clock," I said. I found four of my men down with mild fever, and myself that way disposed, and so I made the lot take a good fair dose of quinine. By 10 A.M., the vapour had all gone, and most things were fairly dry, and so we moved off. From this point, the road speedily assumes a full south aspect, and follows the course of the Rangunga River for a long way. Hitherto, the villages have been mostly Hindoo, but here, on this side of the Rangunga, Bhootias, with hundreds of their ponies, are greatly in evidence everywhere.

About a mile from Tajum, is a very high and big range of rocky hills, and abundance of the wild Date Palm. Many of them I judged to be 70 to 100 feet high. The Rangunga is in many places quite as interesting as the Surgu, and if anything more powerful and wider. Here and there in places is to be seen some very rank vegetation, the Gourd order is greatly in evidence in places; numerous Cucumber and Melon-like plants were in full fruit, some of the fruit was roundish, others long, those I cut open had exactly the smell and seed of the Cucumber. As we wended our way along this road, we made a sharp descent to a small bridge, this bridge crossed a narrow, but very deep water ravine; all around are enormous forest trees, and although it was November, the place was warm. It is an out-of-the-way sort of place; there are not even native villages anywhere within 5 or 6 miles. In this place I found all sorts of things growing most luxuriantly, huge trees with simply cart-loads of Orchids growing on them, apparently about six to ten kinds, and mostly Dendrobiums and Oncidium, but none were in bloom; huge quantities of the beautiful *Cœlogyne cristata* were to be seen, and a few yards further on the most beautiful specimen of *Monstera deliciosa* I have ever seen, occupying about 30 feet of a forest tree, and completely covering it with large healthy foliage. Several fine plants of *Aralia Sieboldi* (?) were to be seen, and some climbers like *Dipladenias*, and numerous other cultivated plants. Unfortunately, I did not expect to find such a place as this, and could not take anything away with me, as my men were all loaded, and business for the present precluded me going there in the rains, but at some future time I hope to pay the place a second visit, notwithstanding it is about 80 miles from anywhere.

Some 5 miles from this spot we came into the open country, and camped for the night; here, although three o'clock, it was uncomfortably warm. I found the natives all attention in this place. They said a Sahib had not been that way for a long time, and could only imagine I must be a Government official, for it must be borne in mind this road is quite off the track, and at least 30 miles from the nearest European station. No European has business that way except for pleasure or shooting. Here, too, a man brought me about the finest comb of honey I have seen in India, quite white, and weighing several pounds. I wanted the man to state his price, but he would not for a long time, he said whatever I was pleased to give he would take, but at last I got him to state his price, which was eight annas, just about 9½d. *F. W. Sears, Ramghur, June 25, 1893.*

(To be continued.)

NOTES ON ECONOMIC PLANTS IN TAHITI.

We gather from a recent report to the Foreign Office that some progress is being made in the cultivation of useful plants in the island of Tahiti. Amongst the most important of these plants Coffee appears to have attracted much attention, and it is considered likely that the natives may take up its cultivation. A beginning on a small scale has been made in the islands of Rurutu and Rimatara, and foreign enterprise also is at work in the island of Tahiti; it will be an important step if the people follow it up. This question has been agitated in Tahiti for the past three years, but with only one exception has anything beyond futile attempts been made to establish plantations. In these latter attempts the old Tahiti system was adopted, which consists of merely clearing away the undergrowth in the bush or forest and putting plants in the untilled soil without trimming, due selection or care.

Coffee-culture on recognised principles has been adopted by an Englishman with promising success. The variety of Coffee known as Tahiti Coffee is a very luxuriant grower, becoming in its natural state a tree often upwards of 20 inches in circumference and fully 20 feet in height, but it is scraggy and overgrown, and on this account usually a poor produce. The plant was first introduced to the Society Islands as early, it is said, as 1823. Subsequently in 1860

the Mocha variety was brought to Tahiti by a Frenchman named Bonnefin, who established a plantation in the district of Faaa, which proved a profitable business. For some unknown reason this plantation was afterwards abandoned and has now completely disappeared. The variety is still found, however, growing wild in the islands of Tahiti and Moorea.

Recognising that the uncared-for, uncultivated Coffee tree in Tahiti was capable of producing an excellent berry, though the crops obtained did not in quantity compare at all favourably with results in other countries, where modern methods for growing were adopted, it was decided by the gentleman above referred to, to attempt the culture of Coffee upon recognised principles.

Seven acres of level valley land were carefully cleaned of bush, weeds, roots, and stumps of trees, the soil was well prepared by means of the plough and horse. Young Coffee plants were then selected from those growing wild in the bush, and the roots and branches having been properly trimmed, they were planted out in holes 10 feet apart, the rainy season being selected for the latter operation.

It was soon ascertained that shade was necessary, and Banana, Apple, and Orange trees were at once planted between the rows. In addition, to ensure permanent shade the Candle-nut tree was planted 40 feet apart throughout the plantation, and has proved the most suitable for the purpose, being well branched and moderately open, admitting just sufficient light and circulation of air. The question of proper protection from the sun is an important point in the cultivation of Coffee in Tahiti; dense shade, though giving good growth, has been found to prevent the tree from bearing. In the 7 acres of land 3500 plants were put out; the Tahitian distaste for cultivation was not indulged in, but a vigorous system of care and management was instituted. The result has more than surpassed the most sanguine expectations of the owner.

Two species of insect pests had to be contended with, the mealy-bug and a green scale, both being very injurious to young plants, but not giving serious cause for alarm in the older trees. The plantation at the date of the report, namely, March last, was commencing its third year of cultivation. The trees were most healthy in appearance, and were growing with symmetrical uniformity. The terminal buds are nipped off as the trees reach 6 feet, to prevent them growing beyond that height. By obtaining thus compact and comparatively low bushes, the picking of the crops is facilitated, and the additional shade thus given will in all probability in another two years prevent the growth of weeds, and thus reduce labour to an annual hoeing of the soil around the trees. Next season the owner intends to let the trees bear for a crop. The bushes blossomed well during the past season, but the berries were picked off at once, so as not to retard the growth. The owner fully expects to realise from the crops of the third, fourth, and fifth years sufficient to repay all the outlay he has been put to for the plantation from the beginning. During the sixth, seventh, and eighth years he anticipates that his crops will average 2 kilos (4½ lb.) per tree each season, and after the eighth year, an average of 3 kilos (6½ lb.) yearly. It is stated that the consumption of Coffee in Tahiti is far in excess of the production. It has been sufficiently proved that the lands and climate of Tahiti are well adapted to the production of excellent coffee, and it may now be assumed that a plantation under cultivation will bring back in five years, at the most, what it has cost. The prospects offered to those who may intend to embark on this enterprise in Tahiti are therefore certainly promising. But it should be remembered that, although for small plantations not exceeding 10 acres home or district labour may be depended on, it would require, before undertaking the cultivation of extensive plantations, a very careful study of the labour question, which is fully recognised to be an extremely difficult problem.

ORANGES.

The Orange tree was originally introduced into the Society Islands from Brazil by the navigator Cook, and subsequently by the early missionaries from the Australian colonies. These two varieties, though still giving a slight difference, have by acclimatization and self-propagation become merged into one variety known in the markets as the Tahiti Orange. The fruit varies from oblong to oval in shape, being rather flattened at the top. It is a medium-sized fruit, very heavy, very juicy, sweet, and highly flavoured, thin-skinned, and the rind of a light lemon-yellow colour. The trees growing on lowlands produce an inferior fruit to those found at higher elevations, and generally supply the early portion of the produce exported on account of their easier accessibility.

The Orange tree in Tahiti is not cultivated, but grows in the wild state, propagation being carried on by raiders, such as rats, &c., scattering the seed, which, owing to the moist warm climate, germinates with certainty and rapidity. With few exceptions, occasionally found on clearings made for dwellings, plantations, and roadways, the Orange tree in Tahiti grows in the bush, straggling, moss-covered, enveloped by tendrils and creepers, and surrounded by weeds, and in this naturally weakened condition is becoming an easy prey to the many species of scale and insect pest now so prevalent, and so carelessly introduced during the last few years. The more vigorous trees found in the open are better able to resist the ravages of this evil, but the consequences in course of time to the so-called Orange groves of Tahiti must be evident to all; still the native, who so greatly depends on the Orange crop as a source of income does nothing whatever to save the trees. He makes no attempt to clear the chaos of jungle surrounding them, or to destroy the pest; he contents himself with living simply on the fruits of nature, so long as they are provided for him.

But this condition of inactivity, if continued, must bring disastrous results. To regain the markets of California, and to retain those of New Zealand, will necessitate attention being given to the cultivation of the Orange tree. As is seen now, the more attractive in appearance, though not superior or even equally good-flavoured fruit produced of late in California has driven the Tahiti Orange out of that market, and it may be that rival Orange growing islands of the Pacific, where attention is now being given to the culture of the fruit, will before long deprive Tahiti also of the market of New Zealand. It is perfectly possible and practicable to make the culture of the Orange in Tahiti a success, and this important matter should no longer be neglected.

VANILLA.

Owing to the fall in the price of Vanilla last year (1892), some of the native planters neglected their plantations to such an extent that even during the flowering season the fertilisation of the plant was not attended to. As, therefore, there are now fewer bearing plants at a time when the demand has again increased, the more thoughtful owners of plantations reap the benefit, and also gain the advantage of the rise in price that has recently taken place.

THE WEEK'S WORK.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

PEACHES AND NECTARINES.—As fast as the trees are cleared of fruit, do not delay to cut out wood which has borne fruit, to be replaced by the new shoots laid in for the purpose in the course of the summer. This operation, besides doing away with the need of much winter-pruning, affords the inexperienced gardener or amateur an opportunity of determining the proper distance between the shoots, the foliage being now of full size. Enough space should be left to allow of thoroughly ripening the season's wood. At this season every care should be taken to keep the foliage intact, so that there may

be no check to the full development of the buds. Strong wood having lateral growths thereon requires special treatment. If the shoot has lateral growths along the greater portion of its length, the best lateral near the base of the shoot should serve as the new leader, the main shoot being cut back to that one, and in no case should the laterals be laid in with the idea of filling up vacant space with them next season. Experience will soon teach anyone that so doing is bad practice, hindering rather than assisting in the forming of symmetrical and fruitful trees. Directly a crop is finished, the tree should be thoroughly washed with a large syringe or the garden-engine to clear it of red-spider, and this kind of work is facilitated by first pruning the trees in the manner described. Any large Peach or Nectarine trees, or, indeed, any kind of fruit tree growing on the Plum-stock, which is to be transplanted at a later part of the year, may now be successfully root-pruned. For doing this a good wide trench should be taken out, not closer to the stem than 4 feet, and with a sharp knife cutting the roots back. The wounds soon form a callus, and if the transplanting be performed carefully early in the month of November, no loss of crop from the transplanting will ensue.

BUDDED APPLE AND PEAR STOCKS.—All those which were budded in July should now be examined, and if it is found that the ligatures are cutting into the bark, loosen them, or where union has taken place remove the binding materials. This is a matter which should not be neglected, as, after the stock begins to ripen, any marks made by tight binding are not easily got rid of. Buds which may have started to grow should have the shoot of the stock cut down to the bud, thus encouraging the scion to develop and mature a shoot this year.

COBS AND FILBERTS.—Like other fruits, Nuts being much earlier than usual will require to be inspected at short intervals, as they must be plucked before they get too loose in the husks. Those which will have to be kept till the spring of next year may be placed in any large earthen vessel, or large plant-pots will answer the purpose if the holes at the bottom be closed with clay. The Nuts, if gathered when quite dry, may go direct into these pots, and be covered with dry sand to exclude the air somewhat. The floor of a fruit-room is more suitable than the shelves for keeping those intended for using first. I never knew squirrels to be more numerous than this season; and these little animals and the nut-hatch have been so troublesome, that, much against my inclination, I have been obliged to have them shot.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

STOVE AND INTERMEDIATE-HOUSE WINTER-FLOWERING PLANTS.—*Centradenia floribunda*, *Centropogon Lucyanus*, *Eranthemum Andersoni*, *E. pulchellum*, *Kalanchoe carnea*, *Libonia floribunda*, *L. penrhosiana* ×, *Ruellia macrantha*, *R. macrophylla*, *Pentas carnea*, *P. rosea*, *Rogiera gratissima*, *R. superba*, *Toxicophlœa spectabilis*, *Crinums*, *Eucharis*, *Pancratiums*, *Plumbago coccinea*, *P. rosea*, *Poinsettias*, and winter-flowering *Gesneras* need to be watered carefully, and kept in perfect health. The great heat of the past month caused a large increase of insect pests, and these must be kept under by liberal applications of plant-manure to the roots, daily washings with clean water, and occasional dressings with insecticides and fumigation. The drainage of all plants in pots should be put in good order, or failures are certain to occur.

CARNATIONS.—As soon as possible pot-off layers of *Souvenir de la Malmaison* and other winter-flowering varieties, employing clean well-crooked pots. Pot firmly in rich sandy loam, water, and shade them from bright sunshine for a fortnight after being potted. Take care that green-fly do not infest them. Large, old plants need to be staked with stout Bamboo canes, these lasting for a longer time than ordinary sticks.

CHRYSANTHEMUMS.—These plants must not be allowed to send their roots into the coal-ashes beneath them, and they should be tied securely to horizontal rods or string. Disbud now as soon as possible, being careful not to injure the main flower-stem, which is often done if the operator is in a hurry. Afford abundance of manure-water, but do not syringe the plants daily, as some growers advise, unless troubled with mildew; then use some composition for destroying it.

SOLANUM CAPSICASTRUM COMPACTUM.—Seedling plants which have been growing in the open ground may now be lifted and potted in turfy loam, leaf-mould, and sand, placed in a cold pit or frame, and kept in a moist state; shading the plants till established. Pots of from 5 to 6 inches in diameter are sufficiently large. Low span-houses are the best to grow them in, giving daily attention to watering, syringing, and cleaning.

CINERARIAS intended for specimens should not get pot-bound; the plants raised from late-sowings are very useful, if grown in 6-inch pots, but they must be kept away from direct sunlight, and free from greenfly and mildew.

MIGNONETTE.—Thin out pots of seedlings, and make another sowing for late-flowering; it is best kept outside under the shade of a north wall as long as possible, or till there is danger from frost, setting the pots on some worm-proof substance, and sprinkling soot round about the pots to deter the slugs. Manure-water, or a pinch of nitrate of soda at times, is beneficial; and if troubled with black aphid, sprinkle the foliage with Quassia-water.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

ONIONS.—In southern shires, the main Onion crop will be ready for lifting. As only the firm well-ripened bulbs keep well, those only should be lifted, leaving immature ones till ripe. When Onions are pulled, they should be placed on hurdles, or taken to an open shed, and spread out till dry. Failing these means of drying the bulbs, place them on a hard path. All thick-necked and unsound bulbs should be put by themselves for present use, not stored with the bulk of the crop.

CABBAGES.—Plants from early sowings will be large enough for transplanting, and the sooner they are put out the more freely will they grow. I prefer to grow a Cabbage crop after Onions, and this land if not heavily manured for the latter, should be well dressed, and deeply dug. There are various ways of planting, and each has its advantages and disadvantages, so that the cultivator must be guided by circumstances. When the ground is not required for any other crop in summer, it is well to plant one row of a large-growing and a dwarf variety alternately, the early and dwarf ones being cut, and the stumps pulled up before the larger Cabbages are ready for use; thus the latter have more space in which to grow. If planted in this manner, the rows should be about 15 inches apart, which will allow the large kinds 2 feet 6 inches to develop in. I have a preference for keeping each variety separate, planting the small sorts about 1 foot apart, and the larger 2 feet. The early ones are pulled up when fit for use, and the others are left, cutting the heads to furnish a supply of Sprouts. A slight dressing of sulphate of ammonia should be spread on the land before planting the Cabbages.

LETTUCE.—The last sowing of Cos varieties to stand the winter may now be made; Hick's Hardy White and the Brown-seeded Bath Cos are the best for this purpose. The situation should be open, but warm, or the plants will suffer during the winter. The land after the partial thinning of the plants has taken place, must be kept stirred with the hoe, and care must be taken that the plants do not get crowded. A well-drained border with a slight slope to the south, and the land made firm by regular treading, suits this crop.

SPINACH.—In some localities seed may still be sown, growth sometimes being made to a late part of the autumn; and when this is the case the early lots get crowded unless the leaves are diligently gathered, which is seldom the case where other vegetables are plentiful.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

SHADING AND RESTING PLANTS.—The shading on most of the houses in which Orchids are cultivated, will need to be used with care, especially those in which are the Dendrobiums, which stand in need of all possible light and sun, to mature the pseudobulbs, the blossoms that set on soft immature pseudobulbs being generally very small; the blinds therefore should be down for a few hours only, the brightest part of the day. Air should be afforded at the same time, and the hot-water pipes kept warm. Any plants which may have finished their growths a

few weeks ago, may be removed into an airy house, but not quite dried off for some time yet, the full development of the flower-buds being not yet finished. When the time comes for removing them from this house, afford a good watering once a week for a few weeks after removal. The species *D. Wardianum*, *D. crassinode*, *D. heterocarpum*, *D. nobile*, *D. densiflorum*, *D. Farmeri*, and *D. thyrsoiflorum*, which were flowered early in the year, are those which may be rested. Plants of *D. nobile* may now be dried off, so that the leaves fall, as the longer these are retained the fewer the blooms. Dendrobiums in full growth will need a plentiful supply of water at the roots, and also overhead, when the weather is sunny. Examine carefully for thrips and red-spider, which, if allowed to gain a footing on the leaves, cause them to fall prematurely.

CATLEYA MENDELI and **C. MOSSIÆ**, if growing freely, should be well-supplied with water. *C. Trianaei*, having made full growth, should be watered with caution, or a second growth will start, which will not flower at the usual time. Afford air abundantly to the house containing the above—at least, in as great a degree as the weather permits. *Catleya* flowers are few at this season, unless there is good stock of *C. Dowiana aurea*, *C. maxima*, *C. Loddigesii*, *C. Harrisoniana*, *C. H. violacea*, *Laelia elegans*, and varieties of *L. e. Turneri*, *L. e. prasiata*. When the above species and varieties go out of bloom, remove them to a cool airy part of the house, and afford less water. These all do best when hung up close to the roof.

MASDEVALLIA HARRYANA may be looked over at this season, and those plants which are not healthy shaken out and re-potted; but as a rule the greater portion of the stock of these plants is left untouched until February. At the present time it is good practice to dip *Masdevallias* in a weak solution of Fir-tree oil to rid them of thrips, and prevent "spot." As a preventive of the last-named malady, our *Masdevallias* are kept at about 55° during the winter.

CYPRIPEDIUMS.—These plants should be examined, and those which were not potted at an early part of the year shifted into larger pots if they are found to need it. The garden hybrids, *Ainsworthii*, *C. albo-purpureum*, *C. cardinale*, *C. grande*, and the finer form *C. g. atratum*, *C. Dominianum*, *C. Schroderei*, and *C. Sedenii candidulum*, are plants of robust growth, and will take a good shift. For these use a good kind of peat, turfy loam, sphagnum moss, with a fair proportion of coarse silver-sand, and finely-broken crocks. The sphagnum should be kept alive, the roots delighting to run amongst it. Manure-water, much diluted with water, may now be afforded with safety to plants which have not been re-potted.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

PINERY.—Plants which have flowered, and those with fruits in various stages of development, should be afforded top-dressings of special manure, incorporated with turfy loam and a little soot. In wide structures, where the plants cannot easily be reached, and their removal is necessary to dress them, it may be advisable to depend rather on applications of liquid manure, as when Pines are rocked about and perhaps twisted at the collars, there is great risk of injury being done. Good Peruvian guano and Clay's Fertiliser are very suitable manures when mixed with rain-water, but they need great caution in the using. There need not be much decrease of temperature for fruiting plants, except when the weather is cool; 90° at shutting-up time and for some hours afterwards, with sun-heat, is a suitable warmth, but it may be allowed to fall to 70° in the morning—sun-heat should be stored and fire-heat avoided as far as practicable. Fruits which are colouring should be kept dry, and have abundance of air; but such necessitates the keeping of the plants arranged in groups according to their various stages of growth. Fruits approaching ripeness may be kept back for some weeks, if they would be more valuable later, by placing the plants in a cool airy room or a viney at rest. A slight decrease of water at the roots will be necessary for young stock, and an average temperature of about 10° less than fruiting plants; where heat depends on manure-linings (and such is the case still in many private places, as well as in market establishments), a quantity of fermenting material should be in readiness to cope with a probable lowering of the outside warmth. Young plants are much improved when water mixed with guano

is placed in pans over the pipes. Soot dusted over the beds at shutting-up time supplies ammonia in the form of vapour, and darkens the colour of the foliage, besides destroying fungus (flowers-of-tan), which is so often present on beds of tan.

POT VINES.—The resting of pot Vines and others to supply early fruit (say in March and April) is now an important matter, and the soil should not be allowed to become wet, but neither should it get in a parched condition. The pots may be laid on their sides, so that rain does not enter. Those which are to afford succession crops should have all lateral growths removed, a free circulation of air in the house afforded, and the foliage kept healthy as late as possible. See that the drainage of the pots is clear, and discontinue the use of liquid manure.

STRAWBERRIES.—Plants now being prepared for forcing early in pots will need much attention, and those which have filled their pots with roots may be afforded liquid manure, which greatly strengthens the crowns. Too much manure may not be afforded, as it might lead to souring of the soil. Crowding the plants together at this season should not be allowed; in fact, it is a safe rule to keep the plants so far apart that the foliage of neighbouring plants scarcely touches. Other matters are the removal of runners, and prevention of roots getting out of the pots. If heavy rains often occur, the pots may be placed on their sides for a day or two; but the rain is less likely to do harm than great dryness at the roots.

THE FLOWER GARDEN.

By T. H. CRASP.

DOUBLE-FLOWERED VIOLETS.—If these plants have had attention in the matter of watering, the soil frequently stirred, and a mulch afforded during the drought, they should now be in a promising condition, the recent showery weather having caused the plants to grow apace, and they need but a few weeks fine weather to cause good crown development, the precursor of abundant bloom during the winter. Beyond cutting off the runners when seen, and keeping the soil free from weeds, nothing more will be required until preparations are made in the last week in September for planting them in cold frames. This operation should not be deferred beyond that time, or re-establishment cannot take place before the winter is upon us. It should be remembered that it is not growth of leaves that is required after the plants are in their flowering-quarters, but active root action.

VIOLAS.—If a stock of these plants for spring flowering has not as yet been obtained from cuttings, no time should now be lost in making them. The cuttings should be stuck into sandy soil under a cold frame for protection, keeping the lights close for a time. When growth commences more air must be afforded, and the points of the cuttings pinched off, for the purpose of giving a bushy form to the little plants. When side-shoots form, the plants are well rooted, and may be transplanted into a light compost in another frame; here they will strengthen, and by the early part of October good plants will have been obtained, furnished with from three to six growths each.

LAWNS, ETC.—This season the sweeping of lawns and walks will need constant attention, the leaves having fallen prematurely everywhere. Attend well to the rolling of gravel-walks, and the destruction of weeds on them by hand-picking, or otherwise. Some of the early-flowering plants will have gone out of bloom, leaving gaps in borders and beds, which are not easy to fill, unless good-sized plants in pots are kept in store. In mixed beds of flowering plants, the late-flowering varieties of Phlox, Asters, &c., may be tied less compactly, and thus made to occupy a larger space; and in that way gaps may sometimes be filled. Petunias and other plants which grow grossly should be pruned slightly, to keep them within bounds.

TRANSPLANTING.—When it is intended to remove large evergreen shrubs, a trench should be dug round each as deep as the deepest roots.

PROPAGATION OF PLANTS.—Actively proceed with the propagation of bedding plants for next year's supply, and of the following hardy border plants:—*Iberis*, *Helianthemum*, *Lithospermum*, *Dianthus*, *Phloxes*, both tall and dwarf varieties, &c. Take young side-growths, and insert these either in pots of sandy soil placed in a shady frame, or firmly dibble them out under bell-glasses in a shady spot.

EDITORIAL NOTICES.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

FRIDAY, SEPT. 8.—Dundee Horticultural Society.

SHOWS.

TUESDAY, SEPT. 5 } Brighton and Sussex New Horticultural (two days).

National Chrysanthemum Society's Show of Dahlias and Gladioli at Royal Aquarium, Westminster (three days).

WEDNESDAY, SEPT. 6 } York Florists, Fifth Show. Derbyshire Horticultural and Agricultural (two days).

THURSDAY, SEPT. 7 } Paisley Horticultural (two days). Newtownards (co. Down) Horticultural.

SALES.

MONDAY, SEPT. 4 } Dutch Bulbs, at Protheroe & Morris' Rooms, at 12.

TUESDAY, SEPT. 5 } Dutch Bulbs, at Protheroe & Morris' Rooms, at 12.

WEDNESDAY, SEPT. 6 } Dutch Bulbs, at Protheroe & Morris' Rooms, at 12.

THURSDAY, SEPT. 7 } Dutch Bulbs, at Protheroe & Morris' Rooms, at 12.

FRIDAY, SEPT. 8 } Dutch Bulbs, at Protheroe & Morris' Rooms, at 12. Orchids, at Protheroe & Morris' Rooms, at 12.30.

SATURDAY, SEPT. 9 } Dutch Bulbs, at Protheroe & Morris' Rooms, at 12.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—59° 3.

The Islington Show.

ALTHOUGH the big show at the Agricultural Hall left much to be desired in grouping, in interest,

and in variety, as compared with many of the provincial and Scotch shows, and especially with the principal foreign exhibitions, yet to those who know the conditions and circumstances of the case, the last effort of the Royal Horticultural Society must be received with satisfaction. In the first place, the evidence of vitality, energy, and enterprise in undertaking so large a matter in a new district of this vast metropolis is decidedly a subject for congratulation. Still more encouraging was it to see greater variation introduced, and a genuine attempt to break away from the formality and monotony of arrangement, to do away with the bazaar-like and obtrusively commercial character of such exhibitions, and to introduce more tasteful grouping, and more instructive displays. Much remains to be done, but it is something to have made such an attempt. That it is possible to serve the interests of the commercial exhibitors, without whose aid no large show could be held, and at the same time so to arrange the material as to produce beautiful pictorial effect, and convey instruction to the public, is shown by the exhibitions in Paris, Berlin, and other continental cities, and may be illustrated to some extent by a view of a portion of the great quinquennial exhibition at Ghent in April last, which we give in the present number as a Supplementary Illustration. It was good policy to illustrate the importance of horticulture to the people by an exhibition in a densely-populated quarter of London, far removed from the "West End," where it may be presumed the lessons which horticulture teaches are less needed, and from the City, where it may also be presumed

that the importance of gardening industry, from a commercial and economic point of view, can be properly appreciated.

As to the building, it was, on the whole, well adapted for its purpose. It was easily accessible; it was spacious and commodious. The light was not, at all times, favourable, but that defect could hardly be remedied. The trumpety flags, the extremely dirty "velarium," excuse the word! the obtrusive advertisements, all these are matters also over which the Royal Horticultural Society had no control. The vast building was well filled, thus negating the idea that material enough could not be got together to occupy the space; the groups were, however, dwarfed by the great height of the building, and no attempt was made to overcome this by raising the Ferns and Palms, as might readily have been done. Some of the smaller groups were well-managed, especially the group of Roses arranged by Messrs. PAUL & SON, and the collection of Dahlias arranged for effect by Messrs. KEYNES, WILLIAMS & Co., and by Messrs. CHEAL. These were so excellent, that we trust they will serve as object-lessons, and effect the permanent rout of those hideously ugly rows and stands in which it is thought correct to show Roses, Dahlias, Chrysanthemums, Gladioli, Carnations, and florists' flowers generally.

The beauty of the groups we have alluded to was a subject of general admiration, and they were so arranged that it was quite possible to judge and to compare the merits of individual flowers, and thus to obviate the objections often raised on this score. Herbaceous flowers were better shown than usual: the specimens were better, less crowded, and arranged with a regard to harmony, or to the contrast of colour, in a way by no means general. A group of hardy Bamboos, shown by Messrs. PAUL, was a delightful novelty, very graceful and effective, and relieved at the base by the artful introduction of colour in the shape of brilliant Cannas and Tritomas. Groups of Lilies and Hydrangeas, though more common, were very pretty and effective.

For educational purposes, nothing could be better in their way than the large series of trained fruit trees in pots shown by Messrs. RIVERS, BUNYARD, CHEAL, and W. PAUL. They must, we should think, have opened up a new world to some of the Islington folk, some of whom (we met with such an instance) had never seen an Apple growing on a tree.

Fruit was largely shown: the Apples were excellent; Grapes have often been seen better; but for details on these and other points we refer to the report in another column. We may, however, allude to the exhibit of Mr. TROTTER, of fruits dried in a similar way to those which the trials at Chiswick have rendered familiar.

Among vegetables there was a very interesting exhibit by Dr. EMERSON, showing various subjects well suited to be more generally grown in this country, such as the Turnip-rooted Parsley, and even the Sweet Potato (Batatas). Such is the apathy of consumers—and so strong the prejudice of gardeners against innovations, that Dr. EMERSON has a hard task before him. He has our hearty sympathies in the matter.

"New Plants" were conspicuous by their absence; almost the only plant coming under this category, that we observed, was the very beautiful Agave, raised by Mr. KELLOCK, and called "Leopold II." Mr. KELLOCK exhibited a similar specimen at Ghent, and presented it to H.M. the King of the BELGIANS. Its dark linear lanceolate leaves, with their fringe of long stiff white hairs at the margins, are very effective.

We observed no foreign exhibits on this occasion, but we were especially glad to see that from far-off Aberdeen came Roses, which were almost as fresh as those from the home counties. Messrs. COCKER, of Aberdeen, and Messrs. DOBBIE, of Rothesay, who showed Pansies, Marigolds, &c., allowed the southerners to see what could be done north of the Tweed.

There will be the usual grumbles on points of detail, no doubt, but on the whole the Society may be heartily congratulated on this fresh evidence of energy and judgment on the part of its officials. Mr. BARRON'S task, in particular, was onerous and laborious beyond what is customary, but he was by no means the less successful. The attendance of the public was not so large as had been hoped.

"JOURNAL OF THE ROYAL HORTICULTURAL SOCIETY."—The first part of the sixteenth volume, edited by Rev. W. WILKS and Mr. J. WEATHERS, has just been published. It contains the second report of Dr. F. W. OLIVER on "The Effects of Urban Fog on Plants," a fine piece of research, doing credit to the Society and honour to its author. Professor HENSLOW'S experiments on growing plants under glasses of different colours prove what all gardeners had found out for themselves, that the pure light of the sun is the best of all light, and culture in the open ground far preferable to that under glass. The injurious effect of glass is due to the excess of heat stimulating respiration and reducing assimilation. Mr. SELFE LEONARD'S rambles with a trowel is an attractive and suggestive bit of writing. Mr. CHESHIRE'S experiments, based in principle on the Rothamsted experience, are defective, inasmuch as they give no idea of the quantities to be used. For American blight, Mr. PILLIN recommends creolin, a product from coal-tar, and which may be bought in the form of JEVES' concentrated fluid; this is used in early spring, in the proportions of half-a-pint of creolin to a gallon of water. This fluid is carefully painted in the cracks of the bark with a brush two or three times, at intervals of a week or ten days; or 2 oz. of creolin, 20 grains of corrosive sublimate, and a pint of water may be mixed, allowed to stand for a day, and then used in the same way, remembering always that the mixture is highly poisonous. Dr. BONAVIA shows the existence of the Citron in Egypt between three and four thousand years ago. A new feature in the *Journal* consists of reviews of books, and the remainder of the part consists of reports of the Society's meetings.

HORTICULTURE IN THE UNITED STATES.—President SMITH, in his opening address to the Society of American Florists at St. Louis, gave the following statistics, showing how important an industry the Society represents:—

"The census report for 1891 shows that there are 4659 floral establishments in the United States, employing 16,847 men and 1958 women. There are 1323 floral societies, florist clubs and horticultural societies in the various States and territories of the Union. Their fuel costs over 1,000,000 dols.; their advertising about the same—that is, independent of catalogues; they pay for postage 767,438.21 dols.; for freight and expressage, 1,088,612.41 dols. The sales of cut flowers, hardy shrubs, Roses, and other miscellaneous ornamental plants amount to 26,211,805.77 dols. It is safe to say there is an increase of 20 per cent. on the above figures since then. We made application to the State and Treasury Departments at Washington for correct information as to imports, and ascertained that we send to the Netherlands, Germany, England, France, Belgium, and Bermuda, over 1,750,372 dols. for bulbs, plants, and seeds. It becomes a question for every patriotic American to consider how much of this sum can we retain on this side of the Atlantic. We seek no special protection. Intellect and industry with cheap land as against cheap labour should be our agents. This Society, socially, and by the aid of printer's ink, diffusing proper information as to what is wanted and how to grow it, will soon secure the desired result. California has already taken up the subject of producing such seeds, bulbs, and plants as her climate is suitable for. On Long Island, in the State of New York, we saw, two weeks ago, on one estate alone, 90 acres of fine, healthy Gladioli—millions of bulbs. To the Long Island florists, we are told, is due the credit that the Gladioli has been changed from an import to an export item of trade. Ten years ago they were

INTERIOR OF THE GREAT HALL, GHEENT EXHIBITION.

all imported. Their price has been reduced to 10 dols. per 1000. I am told by experts that many millions of tuberos bulbs are grown in North Carolina and several other Southern states for domestic and export business. A few years ago they were all imported—their price 10 dols. per 1000. I would like to call the attention of growers to the millions of Roman hyacinths used, and ask, "Can't they be grown somewhere on this side of the Atlantic?"

THE LATE MR. W. D. LLEWELYN.—The deep sympathy of his numerous friends among the horticultural community will be extended to Sir JOHN LLEWELYN in his most sad bereavement. Mr. W. D. LLEWELYN met with his death when out shooting.

A DICTIONARY OF BIRDS.—This is a publication issued by Professor NEWTON of Cambridge, assisted by Messrs. GADOW, LYDEKER, ROY, and SCHUFELDT (ADAM and CHARLES BLACK). The first part only is before us, others are promised with little delay. The work is based upon articles contributed to the *Encyclopædia Britannica*. Dr. GADOW is especially responsible for the anatomical portions. The alphabetical arrangement is adopted in preference to the systematic, because the Editor entertains great doubts whether the newly proposed systems are any better; indeed, he says they are a good deal worse than any they are intended to supersede. That is a point upon which our readers will not expect us to give an opinion. What we may fitly do is to commend the work to their notice, and to assure those interested in birds that they will derive pleasure, interest, and instruction from every page. Perhaps, before the work is finished, it may be possible to give a brief synopsis indicating the principal articles on anatomy, classification, &c., so that they may be read if desired as a continuous series.

GLOXINIA.—In an ordinary Gloxinia the deepest colour is on the inner surface of the corolla tube, the outer surface being of a relatively pale colour. M. Ed. Pynaert sends us a flower in which from the outer part of the tube project petaloid outgrowths, pale on the surface next to the tube, dark maroon on the free surface. We may represent the arrangement thus:—

 The condition is not uncommon, and was described many years ago by one of M. Pynaert's compatriots, a former Professor in the University of Ghent, M. CHARLES MORREN, *Bull. Acad. Roy. de Belgique*, tom. xvi., n. 12. See also EDWARD MORREN, *Chorise du Gloxinia*, *Bull. Acad. Roy. de Belgique*, 2ser. tom. xix., n. 2; *Gard. Chron.*, 1865, p. 865; *Masters' Vegetable Teratology*, German edition (1886), figs. 238, 239, p. 510. The condition is carried to such an extent in some cases that there is a complete second corolla outside the first. In the corona of Narcissus a similar outgrowth has been observed. In these and similar cases of enation it is usual for the arrangement of the tissues to be reversed.

THE HORTICULTURAL COLLEGE AND PRODUCE COMPANY, LD.—At a meeting of the Experiments' Committee of the Kent County Council, held at the Horticultural College, Swanley, on August 24, local taxation of agricultural land, and the effect of the drought on the crops, were discussed. The next meeting is fixed for Thursday, September 7, when the trial plots of the different manures on Beans, and of different varieties of Strawberries, are to be visited; and Professor CHESHIRE is to give an account of some cultural methods he has recently observed in France.

VERSUS WORMS.—Mr. PORTER sends us samples of wire-netting to be placed below the crocks in potting, so as to prevent the ingress of worms. Such contrivances are serviceable against unwelcome visitors of other kinds.

SHAM EDELWEISS.—To meet the desire of the tourist "doing" Switzerland, who would fain take a piece of Edelweiss home with him, some ingenious

person has devised an excellent imitation of the plant. This substitute satisfies the average globe-trotter, and saves the trouble of collecting or cultivating the real thing. The artificial blossom is made, according to the August number of *Nature Notes*, of the "white woollen felted material of military coats, worn chiefly by Austrian soldiers; this, when cut into suitable strips, very much resembles the characteristic upper leaves of the plant, more especially, of course, when the colour is somewhat mellowed by exposure The strips of cloth are carefully cut out, and skilfully grafted on a foundation of any weed that comes handy which may have a superficial resemblance to the Edelweiss in habit. The specimens are then pressed and dried, and the pious fraud is complete."

THE MUSK ROSE.—*Rosa moschata* is a native of N. Africa and Spain, and perhaps of Nepal. HAKLUNT says (1582-1600), "The turkey-cocks and hennes were brought about fifty yeres past, the Artichowe in time of King HENRY VIII., and of later times was procured out of Italy the Muske Rose plant, the Plumme, called the Perdigwena, and two kindes more by the Lord CROMWELL after his travel." Cited in ELLACOMBE'S *Plant-lore and Garden craft of Shakspeare*. BACON mentions the Musk Rose also. GERARD, 1597, describes and figures the Muske Rose:—"The flowers grows on the tops of the branches of a white colour, and pleasant sweete smell, like that of Muske, whereof it tooke his name." The double form is figured also in *Passæus Hortus Floridus Autumnalis*, t. 2 (1614).

THESSALY.—"The rugged north-west of Thessaly is as yet practically unknown, and the explorations of the geologist HILBER and the botanist VON HALLACI, who have been sent there by the Vienna Academy of Science, will be fruitful in interest, apart from the specific objects of pursuit. A botanist is also going to Albania to study the distribution of the mountain flora. The vegetation of the Balkan Peninsula is of a peculiar character, and well worth especial study."

THE LIVER-MOSSES.—Until recently the Hepaticæ or Liver-mosses have been much neglected; yet anyone who takes them up as a hobby will be rewarded by these interesting plants, especially if they study them scientifically, for they offer a field for new discoveries, which is not only rich but attractive. Dr. BRAITHWAITE recently spoke of them as deserving of more attention than they get. They stand rather lower in the scale than the Sphagna or Peat-mosses, as is evident from the number of species never passing beyond the shallow stage of development, e.g., *Marchantia*, *Riccia*, *Lunularia*, *Grimaldia*, &c.; all these differ widely from each other in the form of fruit.

SYNSPERMY IN GINKGO SILOBA.—Professor PIROTTA, of Rome, reports the occurrence of the union of the seed-coats of this plant, leaving the kernels and embryos independent.

THE CONVENTION OF THE SOCIETY OF AMERICAN FLORISTS.—The ninth annual meeting of the Society was opened at St. Louis, Missouri, on Wednesday, August 9, when Mr. W. R. SMITH opened the proceedings with an address setting forth the importance of horticulture from an æsthetic point of view, detailing the enormous advance made in America, and urging the stay-at-homes to abandon their practice, and take part in these gatherings of the fraternity. The Society is mainly composed of traders, of whom no fewer than 829 are members. Besides the presidential address, papers were read by Mr. BERTELMANN, on "Horticultural Exhibitions;" by Mr. A. F. TESSON, on "Rose Growing;" by Mr. J. GURNEX, on "Old and Neglected Plants;" and by Mr. C. H. ALLEN, on "Carnations."

PERIODICITY IN TREE GROWTH.—From a number of careful observations it has recently been found that the increase in the thickness of the branches of trees is, like their length, subject to a certain periodicity. Herr L. JOST states that two,

maxima and minima, are exhibited as regards growth in thickness every season. No particular period, however, can be stated generally as that at which either the maximum or the minimum occurs, for in the different examples which were placed under observation, these occurred at various periods of the year. In the paper in which his observations are described, and which may be consulted in the *Berichte Deutsch. Bot. Gesellschaft*, xx., p. 587, Herr JOST shows that no connection can be established between the period of this growth in thickness and the period of the development of the leaves in each particular species, although the period of the commencement of the formation of the wood coincides with that of the unfolding of the leaves.

THE EFFECT OF THE ELECTRIC LIGHT ON VEGETATION.—A number of herbaceous plants have been observed by Mons. G. AMNIER whilst under the influence of the electric light, the illumination being kept up continuously for some months. Under glass, he found that this artificial light greatly accelerated growth and produced an intense green. If the light is strong and prolonged, the new organs formed in the plant present remarkable modification of structure in their various tissues, but are always rich in chlorophyll. The direct electric light is, on account of its ultra-violet rays, injurious to the normal development of tissue, even when the lamps are at a distance of 6 to 9 feet. When Pines, Beeches, Oaks, and Birch trees are exposed to a strong electric illumination without interruption by day and night, they appear to become exhausted by the continuous respiration thus induced. Further details of this interesting investigation may be found in the *Comptes Rendus*, cxv., pp. 447, 475.

THE QUINCE IN CHINA.—Professor TERRIEN DE LACOUPERIE has a paper in the June number of the *Babylonian and Oriental Record*, wherein he states that the first knowledge of the Quince dates from about 700 B.C., when it was introduced from Media to Greece. Soon after, there is evidence of its existence in China. The Greeks attributed various virtues to it, and some authors have considered that the Apple disputed by HERA, APHRODITE, and ATHENE, was a Quince. By the Hindus and Mahometans all over the East, the Quince is still highly valued, and in China fruits of a large size are brought to Peking from Shantung. The first appearance of the Quince in Chinese literature is, according to the Professor, in an ode dated about 650 B.C., where it is mentioned as forming a complimentary present. Here it is called Mah-Kua, or Tree Gourd, a name also given to the Papaw, but which was introduced many centuries after. The history of the Quince is traced for twelve centuries, and its importation by the South Sea traders to the emporia of the south coast of Shantung. It must not, however, be forgotten that Quince-like fruits are native to China. Thus, *Pyrus japonica* in one or other of its forms is found, according to HEMSLEY, both in the north and south-west of China; whilst under the name *Pyrus cathayensis*, HEMSLEY, a species is noted, called the "Chinese Quince" by Dr. HENRY, and found by that botanist in Central China—this is the *Cydonia chinensis* of THOUIN, and is figured in *Bot. Reg.*, t. 905. LOUREIRO is said to have confounded this with the common Quince. The *Pyrus sinensis* of Lindley (*Bot. Reg.*, t. 1248) is a different plant.

INFLUENCE OF SOLAR RADIATION ON PLANTS.—In the *Comptes Rendus* for August 7, M. LANDEL details some experiments made in the laboratory of vegetable biology at Fontainebleau under the direction of M. G. BONNIER, on the influence of solar radiation on plants. The author mentions several plants, duplicate specimens of which were grown in the sun and in the shade respectively, and he minutely chronicles the differences in growth, colouring, &c., displayed by the plants under these two systems of cultivation. The general conclusions arrived at are as follows: "Variations in the intensity of solar radiation seem always to act in the same way, so far as regards the number of flowers, and the proportion of red pigment which colours the

various parts of the plants. The variations are of very unequal extent, according to the species. With some, the red pigment is well developed in the shade, while others, under the same conditions, remain entirely green. The inflorescence of certain species does not seem to undergo any appreciable modification in the shade; in others the number of the flowers is less—among certain Composites, in fact, this decrease affects not only the number of the flowers, but also that of the flower-heads. This diminution in the number of flowers on plants growing in the shade induces a decrease in the reproductive power, but this result can also be attained in a more direct way, by reducing the number of seeds in the fruits, or by the abortion of the fruits themselves."

FRUIT-GROWERS' ASSOCIATION OF ONTARIO.

—We have before us the twenty-fourth annual Report, containing an account of the proceedings at the annual meeting. Regarding Apples, the dictum enforced by several speakers was, "first and last, feed the Apple tree." Spraying, too, is taken up with much more energy than it is here, and the dictum in this case is "spray early." Attached to the Report is a similar document reporting the progress of the Entomological Society of Ontario.

DEUTSCHE DENDROLOGIE.—Under this title Dr. EMIL KOEHNKE has published a valuable descriptive catalogue, with illustrations, of the trees and shrubs which are found to be hardy in Germany. So far as we have been able to test it, the book has been carefully elaborated, and the synonymy adjusted. The book is written for Germans, but as it would be very serviceable to most of the nations of Europe, and of the northern United States—a far larger area, and with a far more numerous population than that of the Fatherland, it is to be regretted that the Latin language was not employed, at least for the diagnoses. As it is, an English translation is most desirable.

PROTECTION.—One of our American contemporaries, in a spirit of patriotism, announces that, in order to protect home trade, it will accept no advertisements from foreign florists, nurserymen, or seedsmen! Circumstances are doubtless widely different in the States; but here, if we wanted to damage, rather than benefit, horticulture, we should shut out all foreign articles, from Dutch bulbs to Colombian *Odontoglossums*.

TCHICHATSHEFFIA ISATIDEA.—In a recent number of the *Garden*, Mr. MAX LEICHTLIN describes and figures a very pretty little hardy Armenian Crucifer, well suited to the rockery; it bears close tufts of bright rosy-lilac fragrant flowers. The worst thing about it is its name. We once asked the distinguished traveller how his name should be pronounced, and received the following indications as nearly as we can write them—Tshi-bats-off, with a strong accent on the second syllable.

HOME CORRESPONDENCE.

ROYAL SCOTTISH ARBORICULTURAL SOCIETY'S EXCURSION.—Seeing in your issue of August 19 an account of the Royal Scottish Arboricultural Society's excursion to Windsor, it occurred to me that much good might result by the practical foresters who took part in it expressing their views in the *Gardeners' Chronicle* regarding the arboriculture of the districts visited, the programme of proceedings being so large that members had no time to engage in friendly discussion on the interesting features, where possibly a difference of opinion might exist, the excursion thus losing much of its usefulness. As an individual member, I must say I was rather disappointed with the woods at Windsor, where one naturally expects to see the best of management. True, Nature has been lavish in her gifts, and for beautiful scenery few places can equal Windsor; and though the sylvan aspect might please arborists, still I imagine arboriculturists might reasonably expect something better. As an ancient forest, it is right that the ancient appearance should be pre-

served by planting mainly Oaks, Beeches, &c., still I think a greater number of other varieties might be judiciously introduced, judging by the success of the few specimens of *Abies nobilis*, *Cupressus*, &c., to be seen. The parks are mainly furnished with very old trees, and I consider there is a necessity of inserting something for a succession crop, which might be done without in any way interfering with the amenity of the scene. As to the general management of the woods we got little enlightenment—there was no system of thinning pointed out, and we saw no sample of pruning. One little item I would mention, that is, the cruel treatment of the tree known as Queen Adelaide's Beech. One would almost imagine the management had a grudge against this queen's memory, and wished to destroy the tree by fixing those two large iron plates on the trunk, the sight of which is enough to make one shudder. Surely some other system of marking trees might be adopted, such as the pillar at the Maiden Oaks at Cranbourne Chase, for example. In your report the largest tree at Windsor is given as being 35 feet in circumference, while William the Conqueror's Oak is stated to be 36 feet 9 inches. This seems rather confusing, but the fact is, the latter tree was measured at 5 feet up, where it was much riven, and has large abnormal growths. The trunk proper may be seen at from 2 to 3 feet up, where 26 feet would be nearer the circumference. This only proves the fallacy of measuring at a fixed height, especially old gnarled pollards. *A. Pitcaithley, Forester, Sudbourne Hall, Wickham Market, Suffolk.*

THE VICTORIA REGIA.—About twenty-five years ago, I should think, or a little less, an old gentleman came to end his days in the Isle of Wight, for its climate's sake, and pitched his tent near to me. We soon came to be on very friendly terms, and I learned a great deal from him about plants, and gardeners, and gardens, and such like. Mr. Howarth (or Howorth, I do not remember which it was) was a tenant of the late Duke of Devonshire, and had a beautiful place near Hassop, in Derbyshire, and was acquainted with the Duke, and also knew Sir Joseph Paxton quite well before and after his rise. He told me that when the first blossom of the Victoria regia at Chatsworth opened it was in the night or evening, and the Duke was at his marine residence at Eastbourne. Paxton was so delighted with the flower, and he thought the Duke would be so delighted with it, that he chartered an express train, and went off at once to Eastbourne with his prize. He arrived there just before the breakfast-time of the Duke, and he put it on the table so as to be the first thing which would greet him in the morning. "Well done, Paxton!" was the laconic but sufficient commendation of the Duke, and the great gardener went back to Chatsworth with delight. Mr. Howarth was so intimately acquainted with Sir Joseph Paxton, and he lived so near to Chatsworth, that I feel there can be no mistake in this story, which I had from his lips. *Henry Ewbank, St. John's, Ryde.*

—I do not wish to be too hard on "W. W.'s" fanciful theories about this plant, but I assure him he is mistaken about its leaf-development. I have seen the Victoria at Kew, Regent's Park, Glasgow, Sheffield, Chatsworth, and Dalkeith, and had the care of it at one of these places for long enough, and in every case the leaves seemed to behave in the way I have described. "W. W.'s" admission this week, that the leaves of weak plants do lie flat upon the water, is fatal to his case. Strong and weak plants unfold their leaves in exactly the same manner, only in the latter the growing force is sooner spent, and the leaves flatten out sooner. The young leaf stands almost clear of the water at first, like a young hedgehog, and then begins to unroll. Photos are of no use in this case. The reason the leaves are generally seen with a turned-up edge is, that the older leaves soon begin to get ragged at their edges, and are removed to make room for the younger leaves. The plants I had the care of produced leaves over 6 feet in diameter, so they could not be called weak. "W. W.'s" reduction of his "sailors'" ages by a half, is what I expected. His statement this week, that Sir Joseph Paxton's Victoria produced one hundred and fifty leaves and one hundred and twenty-six flowers, is another staggerer. The growing season begins about February, when the seed is sown, and ends by December, so that the rate of development must have been miraculous. Knowing the Chatsworth tank well, I am puzzled to know where they were accommodated, and I venture to say that the like has not been seen there since. A leaf is not produced in a day or even in a week, and when the flowers begin to appear,

the leaves grow less and less. In short, the Victoria behaves like the *Nymphaea*, the leaves of which unfold in just the same way, only the flowers of the *Nymphaea* are much larger in proportion to the leaves of the plant than those of the Victoria. *Vic.*—P.S. "W. W.'s" statement that Paxton's plant "in exactly a year from the opening of the first flower (Nov. 5), it had produced one hundred and fifty leaves, and 126 flowers," is a puzzler, as it shows that the plant was at its best in the dead of winter, when, as all practically acquainted with its culture know, the plant fades and dies off. *F.*

PRICES OF PEACHES.—"Alpha's" complaint as to the prices of Peaches in the market has, in an instance that was the other day brought before my notice, such an obverse side, that I ask leave to give it. A gardener friend earlier in the season, wanting specially a dozen Peaches for a particular dinner party, asked a neighbouring gardener who had several Peach-houses and started early especially for market sale, to send him over a dozen fruits, and he would pay him later on. The fruits sent were not particularly fine ones, but they served the purpose. Some ten days since the gardeners met, and when the latter asked of the former what he owed for the Peaches, instead of saying, as so many gardeners kindly do with fellow-gardeners, "Oh, when I want something special I will ask you to send it in place of the Peaches," he said the price was 2s. and that sum my friend paid out of his own pocket. I hope for the credit of the profession the seller in question is the only gardener in the kingdom who would do so mean an act. *D.*

JUDGES AND SCHEDULES.—I suppose that so long as flower-show judges are poor mortals, they will make egregious blunders, although those Mr. Pettigrew refers to are quite inexcusable. But badly-drawn schedules have much to answer for, especially when conditions governing classes are affixed that are inexplicable, or are so remotely placed in the schedule that they are overlooked. A curious case occurred the other day where a class for "hardy fruit" was competed in by some eminent gardeners, one of whom having much the best collection, staged several dishes grown under glass. I was appealed to for an opinion, but although it may have been the intention of the drawers of the schedule to have only outdoor fruit, it was not so expressed, and I had to say that the judges could not go beyond the schedule in their awards. It would have been so easy to have required the fruits exhibited to have been grown outdoors. *A. D.*

A DWARF SUNFLOWER.—Herewith I send you a specimen flower of a new dwarf single Sunflower which I have raised and grown now for three years. I have also raised another variety with a single row or detached petals, both varieties growing only 2 feet high. I had intended to send the enclosed with plant to the Royal Horticultural Society, but found that it would not last so long. *W. Sellers, 2, Foleshill Road, Coventry.* [The flower is a good one, and the variety may be useful, on account of its dwarf character. *Ed.*]

MAIZE (Indian Corn).—We have grown this, more or less, for the last fifteen years, and during the whole time we have only ripened the cobs in two years. The fault has evidently been in the variety grown, as, until this year, our tallest specimens have been under 6 ft. high, and the cobs, when they have ripened, have been very small. We have had an annual hunt for a variety which would grow strongly in a temperate climate, and I may give the credit of our success this year to Messrs. Clibran, of Altrincham, who have found us a variety which comes to us named *Zea Caragua*. Growing in the open it is now 8 ft. high, with large cobs, showing it has the rank tropical appearance which Maize has in its natural climate, and one plant, lifted from outside, is now 13 ft. high under glass. To those who admire the beauty of this plant, and who like green Corn to eat, *Zea Caragua* appears to be the variety to grow. I have been a great and constant trouble to Messrs. Clibran in this matter, and can only express my satisfaction that they have at last succeeded in finding a variety which suits our climate perfectly. *Thos. Fletcher, Grappenhall, Cheshire.*

CATALPA SPECIOSA.—For the sake of exact record, I am glad to see Mr. John Booth's statement. It then appears that not having heard or read of any previous flowering of this tree, I was too incautious, and should have done better to write "probably for the first time." It seems that the wonderful climate

of Tourraine and the fertile sand of Berlin has brought the tree to an earlier condition of flowering than the clayey soil of Baden-Baden, for all these came from the first batch of seedlings raised after the discovery of the plant. The honour of drawing attention to this tree, and the subsequent most liberal distribution of plants and seeds, is due to Chas. S. Sargent, Professor and Director of the Arnold Arboretum, Jamaica Plain, America. I will inquire at Neustadt-Eberwalde, Tharand, Bamberg, and Vienna to know what has become of the plants, which at Mr. Sargent's request I sent there and reported upon. As the trees seem to thrive well at Berlin, it is worth while to call attention to the plant as a splendid landscape, alley, and timber tree for all middle Europe. *Max Leichtlin, Baden-Baden.*

HYBRID CLEMATIS.—With regard to the Clematis described by M. André in the *Revue Horticole*, I beg to state that I have raised a hybrid between *C. coccinea* and *C. lanuginosa*, the latter being the seed-

they were fastened upon a glass stool, with Hercules working a generator at her. *John and Joan Green-gage, of Applegarth.*

AUTOMATIC TEMPERATURE RECORDER.—The writer of the article on the above subject appears to be unaware that an instrument for this purpose has been commonly known and used for many years past. It is similar in size and appearance to the barograph, or self-recording barometer, the stock patterns of both instruments running one week. I have had one of these, known by the makers as a thermograph, fixed outside my conservatory for some years past, and enclose one of the charts obtained during the week ending July 17, the week running from Monday to Monday. The only objection to these for exact work is, that the recording pen is liable to gradually rise, and give tracings above standard readings; for this reason it is necessary to compare each week's chart with the record of a standard verified thermometer, and if necessary, to reset the pen. The motion of

Anthurium was a young one, and there was little or no pollen visible on its spadix when I first applied the Richardia pollen with a small paint-brush. On the second application, made some days after, I certainly noted that Anthurium pollen had appeared, hence the production of the scarlet-spathed seedlings, along with the five scarlet and white hybrids. As there are so many distinct flowers on each spadix, I presume it is possible for some of them to be fertilised with the Richardia pollen, while the others are fertilised with that of the Anthurium. Another of my hybrids is showing a white spathe, and if it comes to maturity I shall have great pleasure in forwarding the spathe to you. *O. O. Wrigley, Bridge Hall, Bury, Lancashire.*

LILIUM TIGRINUM SPLENDENS.—Of this magnificent hardy Chinese Lily introduced in 1804, we have this year a splendid bed, which for show or brightness of colour certainly excels all else in the flower garden. The stems are near upon 6 feet high, and many of them carrying from twelve to twenty flowers of bright deep orange, profusely besprinkled with black spots. What this bed is edged with, or with what it is surrounded, I must not enter upon any description here, or I should get myself into a labyrinth of detail out of which I would have difficulty in finding a way. Suffice it, therefore, to say that this gorgeous "clump" of Lily—as Capability Brown used to say—was brought to its present state of excellence with but little care or trouble. During the autumn of 1889 I gathered a quantity of those little bulblets which form in the axils of the leaves. These were sown in pans in October of the same year, and planted out thinly in May, 1891, where they have remained ever since. I have no difficulty in giving the age of these plants, as from the weather-beaten label I have taken the above dates. I do not particularly wish to write a libel on our old friends the Dahlia or the Hollyhock, but for clumps, masses, or the back of herbaceous borders, nothing that I am acquainted with can compare with this Tiger Lily. That these Lilies will become popular I have not the least doubt, especially if the simple method of propagating becomes more generally known; as a show plant in autumn, there is nothing to approach them. They are hardy, and appear to enjoy perfect immunity from all insect pests, both above and below-ground. In a large room, and in proportionately large flower-vases judiciously placed, with two or three spikes in each, they make quite a "burning and a shining light;" and for effect, it is questionable whether they could be beaten by any of the far more expensive flowers of the Orchid family. *W. Miller, Combe Abbey.*

FIG. 49.—DWARF ALMOND, *AMYGDALUS NANA*: SHOWING THE FRUIT.

A, husk removed to show the stone; B, longitudinal, and D, transverse section through fruit; C, Embryo showing one cotyledon and the plumule.

parent; it has flowered for the last three years, on young shoots sprouting from the root, and dying down in autumn. The flowers are intermediate, cup-shaped, half open, of large size, and of a bright rosy-purple colour. *Max Leichtlin, Baden-Baden.*

MARKET PRICES.—Your correspondent "Alpha" does not overstate the truth, and we can confirm, and even outdo, his price-list, for good Grapes of ours were sold—or said to be so—at 8s. per lb. in June. While everything flies in the lump to Covent Garden, that very foul hole must be crammed, and all its contents trodden on. Meanwhile, to the public the price of fruit is as monstrous as ever, at least, if they get it from the west-end tradesmen, who will not deal with the grower direct, because they can get his produce for next to nothing from the salesmen. These latter undertake ten times as much work as they can properly discharge, and dash through it anyhow, to the ruin of their consignors. While this system lasts, it must be nothing but a cruel mockery to talk of the "profitable growth of fruit" in the neighbourhood of London, or anywhere in the south of England, for which Covent Garden rules the prices. We could tell tales by the dozen which would make the hair of Justice stand on end, as if

the pen is caused by the action of varying temperatures on a compound bar of steel and brass, similar in construction to the compensation balance of a watch. The twisting caused by unequal expansion of the two metals causes a strain which slowly alters the form of the compound bar, the free end of which is connected to the recording pen, thus causing a gradual error, which requires correcting at intervals. The use of this instrument will explain why apparently severe night frosts sometimes do comparatively little damage, when at other times a higher temperature as shown by an ordinary minimum thermometer, does a considerable amount of mischief. In the former case the thermograph will show that the low temperature has had a very short duration, whereas in the latter it will have continued throughout the night. An ordinary minimum thermometer is misleading, as it does not show the duration of the cold period, but simply marks the lowest temperature, which may not have lasted for half-an-hour out of the twenty-four hours. *Thos. Fletcher, Grappenhall, Cheshire.*

HYBRID ANTHURIUM.—In respect to the fertilising of the Anthurium with the pollen of the Richardia, I can only say that the spathe of the

AMYGDALUS NANA.

A VERY old inhabitant of our shrubberies is the dwarf Almond, *Amygdalus nana*. It flowers generally every year, but the fruit is so rare that we avail ourselves of the kindness of a correspondent, who has grown the plant for sixty years without previously seeing the fruit, to give a figure of it. The drupe is like that of an ordinary Almond, but the stone is not so deeply pitted and furrowed. The dwarf Almond is a native of Northern Asia, the Caucasus, and Southern and Central Russia and Armenia. We are not aware whether the experiment has been tried, but it would seem as if from its hardihood and dwarf habit that it might be useful as a stock for Peaches and Plums, though its habit of producing suckers would be objectionable.

TREES AND SHRUBS.

BLUE CONIFERS.

IN the Scotch Arboretum there are three Conifers that are of such a deep glaucous hue that they may well be termed blue, or, rather, azure-coloured. They are the Oregon variety of *Abies nobilis*, *Picea pungens glauca*, and *Abies concolor violacea*. The tallest *nobilis*, Mr. McKinnon said, was 83 feet in height. *Pinus monticola* also succeeds in this famous arboretum. There were several tree-like specimens; the tallest was 70 feet. The distinct-foliaged *A. Albertiana* reached a height of 52 feet; according to Mr. Hunter, it is so hardy that it will withstand the winds of bleak Rannock. *Fagahond.*

SOCIETIES.

ROYAL HORTICULTURAL.

Great Show at the Agricultural Hall, Islington.

AUGUST 29, 30, 31, and SEPTEMBER 1.

Floral Committee.—On this occasion there were present, George Paul, Esq., in the chair; and Messrs. H. B. May, Chas. T. Druery, J. D. Pawle, R. H. Williams, Chas. Pearson, Robert Owen, Chas. Jefferies, W. Bains, Geo. Stevens, T. Godfrey, A. Dean, J. H. Fitt, R. B. Lowe, C. J. Salter, J. Jennings, H. Turner, Frank Ross, Peter Barr, Chas. Noble, and Geo. Gordon.

Messrs. J. Veitch & Sons, Chelsea, were awarded a First-class Certificate for *Cornus brachypoda variegata*, also for *Clerodendron trichotomum*, a hardy shrub, generally known, and of good decorative quality. W. B. Kellock, Esq., showed *Agave Leopold II.* and *A. univittata marginata*, both very pretty and attractive hybrids. In each case a First-class Certificate was awarded.

Mr. Reynolds, gr. to the Messrs. de Rothschild, Gunnersbury Park, Acton, obtained an Award of Merit for *Carnation Mrs. Leopold de Rothschild*, a pink flower, full, and of good size. Sir Trevor Lawrence, Burford Lodge, Dorking, exhibited a plant of *Exacum macranthum*, not often seen, although known some time. Its flowers, of a dark blue, are very showy in a stove (Award of Merit). Also *Pentstemon Clevelandi*, a pretty plant, producing long spikes, bearing slender tubular, scarlet flowers (Award of Merit).

From Mr. Anthony Waterer, Knapp Hill Nursery, near Woking, came *Weigela Eva Rathke*, a variety producing very fine dark red or crimson flowers. If it will bloom at so late a period, it will be valuable (First-class Certificate).

An Award of Merit was given to *Pink, Ernest Ladhams*, shown by Mr. B. Ladhams, apparently a very desirable border variety. Several Lilies were shown by Messrs. Wallace & Co., St. John St., Colchester, and to *Lilium Henryii* was granted an Award of Merit. The same distinction was given to *Helianthus rigidus var.*, Miss Mellish, exhibited by the Rev. W. Wilks, a large flower of bright yellow.

Messrs. Barron & Sons, Elvaaston Nursery, Borrowash, Derby, contributed a rather large collection of foliage picture-trees and shrubs, which included most of the finer species and varieties with variegated or other than green-coloured foliage, of *Acer*, including *A. negundo aurea variegata*, *Fagus*, *Cornus*, *Quercus*, *Symphoricarpos*, *Ulmus*, *Hydrangea*, *Berberis*, and *Sambucus*.

Messrs. J. Peed & Son, nurserymen, Norwood, S., had an excellent small table of *Caladiums*, some *Bertolonias*, and *Strobilanthes Dyerianus*.

Mr. Ant. Waterer, Nurseries, Knapp Hill, Woking, showed a number of perfect specimens averaging four feet in height, of the *Blue Spruce* of Colorado, *Picea pungens glauca*, an admirable Conifer for garden and park planting.

COMPETITIVE EXHIBITS.

Groups.—Groups of Palms and foliage plants, to occupy a space not exceeding 800 sq. feet.—A group of Ferns, Palms, Crotons, &c., the Palms forming the backbone, was staged at the south end of the building by Mr. H. B. May, Dyson's Lane Nursery, Edmonton, and, like the rest, was confined to a straight-lined figure, which, if it was not displeasing, had nothing to recommend this mode of arrangement. With some amount of allowable filling-in with common forms of Ferns, and as forming a groundwork, the best things and finest-grown specimens and rarities were lightly spread about, Ferns alternating with *Dracenas*, *Crotons*, *Palms*, and *Marantas*. Of Ferns shown in this group, we may mention *Platycerium stemmaria*, a fine West African evergreen species, of easy culture and propagation; *P. grande*, a fine piece of a striking Malayan species; *P. alci-corne*; *Adiantum cardiochlaena*; many forms of *Adiantum*, *Pteris*, and *Davallia*; some of the first two crisped and tasselled; *Gymnogramma Mayi*, a beautiful form of silver Fern; *Meniscium oligophyllum*, a broad fronded species that is rendered very effective when the narrow fertile fronds appear covered with black sori; *Aglaomorpha Meyeriana*, is a beautiful Fern of robust habit, the frond simply pinnate, the fertile ones narrow and the sori of a brown colour.

Phrynium variegatum (*Maranta*), with white and green foliage, is a highly decorative subject, and was

observed in some quantity. *Crotons* were rather numerous, the best being *Neumannii*, *Alexandra II.* (a very brightly coloured leaf), *Musaica*, *Fleming*, and *Mortefontaineis*. In Palms were noticed *Kentia Forsteriana*, *K. Belmoreana*, *Sealofthia elegans*, *Cocos Weddelliana*, *Areca crinata*, *Geonoma Schilleriana*. Other plants consisted of variegated *Ananas*, *Ficus elastica variegata*, *Marantas Makoyana*, and others; *Dieffenbachia Regine*, *Pandanus Veitchii*, and *Dracenas* in variety (1st prize).

A group was furnished by Messrs. W. Cutbush & Son, Highgate Hill, N., with Palms as a background, and Lilies, *Bouvardias*, *Pantraciums*, *Dracenas*, &c., as filling material. Like many of the other groups, it had a poor effect.

H. Tate, Esq., Park Hill, Streatham (gr. Mr. Howe), showed a group of twelve stove and greenhouse Ferns, fine well-grown specimens, not too large, but ranging from 3 to 4 ft. in diameter. The finest of them were *Gymnogramma schizophylla gloriosa*, an elegant species; *Goniophlebium sub-auriculatum*, *Adiantum Williamsi*, *A. Wigandii*, a nice Fern with sub-divided pinnæ; *Microlepia hirta cristata*, *Dicksonia antarctica*, and *Nephrolepis exaltata* (1st prize).

Messrs. MacArthur, 4 Maida Vale, W., showed a group of twelve Ferns of medium size, of stove and greenhouse species. We may mention *Adiantum concinnum latum*, *A. decorum*, *Davallia Mooreana*, *D. elegans*, *Gymnogramma schizophylla gloriosa*, *Pteris scaberula*, *Microlepia hirta cristata*, and *Nephrolepis triplinatifida rufescens*. The plants did the exhibitor much credit (2nd prize).

Messrs. B. S. Williams & Sons, Victoria and Paradise Nurseries, Holloway, showed two specimen Palms.

Twelve Palms.—In this class, Messrs. B. S. Williams & Sons showed a group of plants in pots not more than 10 inches in diameter, healthy and vigorous examples of *Rhaphis flabelliformis*, *Saforthia elegans*, *Areca lutescens*, *Cocos Weddelliana*, *Phoenix rupicola*, *P. tenuis*, &c. This firm exhibited a fine large group of foliage plants in considerable variety. Amongst them were *Tillandsia musaica*, a nice plant; *Phyllotaenium Lindeni*, a very fine mass; *Dracena lentiginosa*, *Crotons* in variety as affording the desirable amount of colour foils to the green. Intermixed with the foliage plants were such Orchids as *Cattleya Gaskelliana*, *C. maxima Backhousiana*, *Burlingtonia fragrans*, *Cyclogyne Massangeana*, *Miltonia vexillaria*, *Dendrobium Phalenopsis Schroderiana*, various *Cypripediums*, and some *Nepenthes* in pitcher. The rest of the group consisted of ordinary furnishing materials.

A very pleasing group, rather unusually arranged, was that furnished by Mr. J. Hudson, gr. to Messrs. Rothschild, Acton, on a space of 300 square feet. The plan consisted of a low ground-work of *Maidenhair Fern* and other plants of low stature, dotted about over which, their pots hidden by the greenery, were specimens of *Lilium speciosum album*, and *L. s. roseum*, *Agapanthus umbellatus*, *Campanula pyramidalis*, *Francoa ramosa*, *Bouvardias*, *Rochea falcata*, *Caladiums*, *Ophiopogon spicatus*, *Pandanus Veitchii*, *Ericas*, *Vallota*, &c., and at the back of the group a number of Palms of greater height than the rest of the plants. This was the only one shown in this class, and was awarded 2nd prize, but was well worthy of a 1st.

A group of plants covering 150 square feet, and consisting of flowering and foliage plants, was arranged by Mr. J. Nicholson, gr. to J. W. Melles, Sewardstone Lodge, Chingford. It was a lovely group of what is termed furnishing plants, arranged in close order, with a great many *Crotons* intermixed, simple enough truly, but with a certain kind of effectiveness. Some Palms formed a background to the whole (1st prize).

Mr. J. Hudson, gr., Gunnersbury House, showed an excellent group, covering 150 square feet, of scented-leaved *Pelargoniums*, mostly in bush shape, the only exceptions being two fan-trained examples of *P. fragrans*, 6 feet long by 5 feet high, less than three years old. The plants were strong, healthy, and well furnished with foliage, but sparsely, in all instances, with flowers. As examples of good culture they were unique in their way. Intermixed with these were a few standard plants of *Aloysia citrodora*, which showed the remains of numerous flower trusses (1st prize).

A group of eight *Crotons* was shown by Messrs. B. S. Williams & Sons, plants of 3½ feet high and in diameter, consisting of the finer varieties in good form (2nd prize awarded).

Mr. H. J. Jones, Ryecroft Nursery, Lewisham, had a telling mass, in pyramidal form, of *Pelargoniums Dahlias*, &c. Among the first-named was Mrs. W.,

Wright, a so-called blue-coloured variety, but not considered so good as *Blue Peter*, really a purplish-magenta, it has a fine large truss. The flowering plants were set in a mass of *Maidenhair Fern*.

The end group at the north of the building was contributed by Messrs. E. D. Shuttleworth & Co., Peckham Rye and Fleet, Ilants. It consisted of large Palms, *Aralias*, *Cycads*, *Coleus*, *Ficus elastica variegata*, *Caladiums*, *Crotons*, and *Dracenas*, the whole being effective as a screen or finish at that part of the hall.

Groups of Lilies in pots or as cut spikes on a space of 150 square feet.—This was a group arranged with foliage-plants, the work of Messrs. Bunting & Son, nurserymen, London Road, Colchester. The group consisted of *L. auratum platyphyllum* in excellent bloom, and *L. a. virginalis* at the back part, and in the middle and foreground, *L. longiflorum*, *L. tigrinum fl.-pl.*, *L. speciosum album*, and *L. s. roseum*, *L. Fortunei*, and *L. Batemanii* (1st prize).

Two *Cycads*, viz., *Ecephalartos caffra* and *Cycas circinalis*, were shown by Messrs. B. H. Williams & Son. The former had a stout stem of two feet in height and leaves six feet in length; and the latter was a remarkably fine plant, with a stem one and a half feet high, and numerous leaves.

A novel group was the one set up by Messrs. G. Paul & Son, Old Nurseries, Cheshunt, consisting of Bamboos and tall grasses shown in pots as grown. There were mixed with these some poor specimens of *Tritoma Uvaia*, and new varieties of *Canna* bearing flowers.

Group of *Coleus*, specially well grown, came from J. W. Melles, Esq., These were mostly grown as bushes, and the colours left nothing to be desired. In size the plants ranged from 3 to 4 feet in diameter, and rather less in height (1st prize).

CUT FLOWERS.

This division, which included the whole of the cut flowers, was well-filled, and of itself made an exhibition of high character; the light was good, and the Dahlias especially were seen to great advantage. It is not too much to conclude that at this season of the year there is an abundance of stove and greenhouse flowers, and yet the class for twenty-four bunches, distinct, did not bring a single exhibitor. In the class for twelve bunches, the 1st prize was awarded to Mr. J. Gibson, gr. to T. B. Atkins, Esq., Halstead Place, Sevenoaks, with massive bunches of *Eucharis amazonica*, *Pantracium fragrans*, *Dipladenia Brearleyana*, *D. amabilis*, and *D. bolivien-sis*; *Clerodendron fallax*, *Lapageria rosea* and *alba*, *Anthurium Scherzerianum*, *Ixora Fraseri*, *Allamanda Schottii*, &c. 2nd, Mr. Howe, gr. to H. Tate, Esq., Park Hill, Streatham Common, who had *Gloriosa superba*, *Eucharis amazonica*, *Allamanda Schottii*, *Valotta purpurea*, *Odontoglossum grande*, *Cypripedium barbatum superbum*, *Stephanotis floribunda*, *Gloxinas*, *Bouvardias*, *Streptocarpus*, &c.; 3rd, Miss R. Debenham, St. Albans.

Gladiolus.—The exhibits of these plants were in very fine form, and the spikes grown by Messrs. J. Burrell & Co., Howe End Nurseries, Cambridge, were really superb, and consisted of some 200 spikes of bloom. Among them were some very fine new varieties, viz., *O. Iando*, *Gertrude*, *Cassandra*, *Bernice*, and *Leonora*, *Conquerant*, *Baroness Burdett-Countess*, *Pollux*, *Chameleon*, *Iolanthe*, *Cygnus*, *Flambeau*, *Amitié*, *Carnatio*, *Tour du Monde*, *Matador*, *Rayon d'Or*, *Pyramide*, *Igne*, *Jeanette*, *Enchantress*, *Formosa*, *Belladonna*, *Crepuscule*, *Grande Ronce*, *Sorcerer*, and *Pasteur*—as fine a collection as anyone can well desire to grow; and a collection of hybrids of *G. Lemoinei*. 2nd, Messrs. Kelway & Son, nurserymen, Langport, who also had a very large collection, the leading varieties being *James Kelway*, *Sir F. Bolton*, *Ovid*, *Conquerant*, *Dr. Benson*, *Princess Royal*, *Mr. D. Mainwaring*, *Ormonde*, *Berron*, *Mrs. Gladstone*, *Baroness Burdett-Countess*, *Duchess of Buccleuch*, *Clemence*, *Maid of Orleans*, *Princess Olga*, &c.

Dahlias were numerous, of very good quality, and the collections arranged for effect took up a considerable amount of space, and were highly effective, the blooms generally being clean, fresh, and bright. Messrs. J. Cheal & Sons, nurserymen, Crawley, were 1st with show *Cactus*, *Pompon* and single varieties, arranged in cones and sloping stands, and also in striking bunches and in boxes, hardy flowers, *Palms*, and Ferns being suitably intermingled. 2nd, Messrs. Keynes, Williams & Co., Salisbury, who had in the centre an archway of bark, lined with scarlet Dahlias, also cones and panels of various Dahlias, show, decorative, pompon, and single; also stands and bouquets of the same, finished off in the front

with bark and moss, various foliage being employed for effect. These were the only competitors.

With a collection of sixty show and fancy Dahlias, 1st, Mr. John Walker, nurseryman, Thame, with large, fresh, bright-looking blooms of fine quality. He had Majestic, William Rawlings, Colonist, Burgundy, Henry Walton, Harry Keith, Earl of Ravensworth, Crimson King, John Walker, T. J. Saltmarsh, Prince of Denmark, John Henshaw, Fred. Smith, W. Keith, Mrs. Gladstone, Mrs. D. Saunders, Matthew Campbell (fancy), J. T. West, Harrison Weir, Shirley Hibberd, John Heckling, J. N. Keynes, John Standish, Dr. Moffat, Mrs. Harris, and James Stephens, several being in duplicate. 2nd, Mr. S. Mortimer, Swiss Nursery, Farnham, who had Mrs. J. Downie, Burgundy, Dandy (fancy), John Hickling, John Walker, Rev. J. Godday, Maud Fellowes, Comte de la Saux (fancy), Matthew Campbell (fancy), Willie Garratt, Mr. G. Harris, Mr. Gladstone, Wm. Rawlings, Mrs. D. Saunders, Major Bartelott, Rebecca (fancy), Sunbeam, T. J. Saltmarsh, Nugget, George Rawlings, George Barnes, Gloire de Lyon, Diadem, and Glowworm. 3rd, Mr. C. Turner, Royal Nursery, Slough, Messrs. Keynes & Co., also exhibited.

Cactus Dahlias were shown in superb bunches. The best eighteen came from Messrs. Keynes & Co., who had Lady Penzance, soft yellow; Black Prince, St. Catherine, Baron Schroder, Kaiserin, Apollo, a bright scarlet; Countess of Radnor, Delicata, very beautiful; Dawn, lemon deepening to orange, slightly shaded in the centre; Countess of Pembroke, Lady Skelmersdale, Duke of Clarence, Lady Henry Grosvenor, Sir Roger, Miss Violet Morgan, Chancellor, crimson, suffused with purple; Countess of Gosford, orange-salmon, deep lemon centre; and Bertha Mawley, very rich and bright. 2nd, Messrs. J. Cheal & Son, who had fine and striking bunches of Kaiserin, Bertha Mawley, Countess of Gosford, Delicata, Duke of Clarence, Kynerith, Beauty of Eynsford, Ernest Cheal, fine scarlet; Professor Baldwin, Marchioness of Bute, Robert Cannell, Duchess of York, deep orange; Beauty of Arndel, Black Prince, Countess of Radnor, Lord Rosebery, and Juarez. 3rd, Mr. C. Turner, who had bold bunches of Amphion, Lord Rosebery, Black Prince, Professor Baldwin, Blushing Bride, Beauty of Brentwood, Sir Hugo, Mrs. Hawkins, Kynerith, Delicata, and St. Catherine.

Equally striking were the bunches of Pompon Dahlias. With twelve bunches, Messrs. Keynes & Co. were 1st with Crimson Beauty, Lady Blanche, Little Jack, Little Frank, Midnight, Whisper, Janet, Sovereign, Admiration, White Aster, Isabel, Ceres, Darkness, Lælia, Grace, George Brinkman, Bacchus, and Madge. Messrs. Cheal & Sons were 2nd with Arthur West, George Brinkman, Sunshine, Darkness, Goldfinger, Martial, Phoebe, Lady Blanche, Isabel, Boule d'Or, Marion, E. F. Jungker, Whisper, Grace, Cecil, Eva, Tommy Keith, and Favourite. 3rd, Mr. C. Turner, with Rowena, Fairy Tale, White Aster, Captain Boynton, Irene, Dart, Lady Blanche, Phoebe, Whisper, Eric, and H. E. Searle. Single Dahlias in bunches of ten blooms were highly effective also, and again Messrs. Cheal & Sons were awarded the 1st prize with refined and even bunches of Guilielma, A. Hughes, Bride, James Scobie, Evelyn, Lowfield Beauty, Yellow Satin, Mrs. Glascock, Ruth, Aurora, Amos Perry, W. C. Harvey, Duke of York, Lady Whitehead, Kitty, Formosa, Victoria, and Northern Star. 2nd, Mr. E. F. Such, nurseryman, Maidenhead, with James Scobie, John Cowan, W. C. Harvey, Fashion, Victory, Duchess of Anhalt, Mauve Queen, Lutea grandiflora, Sir G. Wolseley, J. S. Ware, Northern Star, Lady Montefiore, Lowfield Beauty, Mr. Rose, Miss Henshaw, and Eclipse. These were the only exhibitors.

Show and Fancy Dahlias were capitally shown by amateurs in the class for twenty-four blooms. Mr. J. T. West, gr. to W. Keith, Esq., Cornwallis, Brentwood, who had finished blooms of Harry Keith, Alice Emily, J. T. West, Wm. Rawlings, Dorothy, Ethel Britton, Edwd. Sharman, Geo. Rawlings, John Walker, Willie Garratt, Maud Fellowes, Arthur Rawlings, Sunbeam, R. F. Rawlings, Harry Keith, Prince of Denmark, Frank Pearce (fancy), and Mrs. Gladstone. 2nd, Mr. J. Vagg, gr. to J. Theobald, Esq., J.P., Bedford, Havering, Romford, who had George Barnes, Maud Fellowes, Harry Keith, T. J. Saltmarsh, Duchess of Fife, R. T. Rawlings, Prince of Denmark, Mrs. W. Slack, Mr. J. Downie (self, and also in its fancy form), Rev. J. B. M. Camm (fancy), T. W. Gurdlestone, Arthur Ocock, J. T. West, Mrs. Glascock, Mrs. Langtry, and Mr. McIntosh (fancy). 3rd, J. Gurney Fowler, Esq., Woodford, Essex.

Amateurs also exhibited twelve bunches of Cactus and decorative Dahlias, Mr. J. T. West being again 1st, with fine bunches of St. Catherine, Joseph Chamberlain, &c.; 2nd J. G. Fowler, Esq., with King of Cactus, Mrs. Hawkins, Cannell's Favourite, Lady Marsham, Cardinal, Marchioness of Bute, Sir Hugo, Amphion, &c.; 3rd, Mr. Jas. Hudson, gr. to Messrs. De Rothschild, Gunnersbury House, Acton.

Special prizes were offered by Messrs. Keynes, Williams & Co., for twelve bunches of true Cactus Dahlias, the only exhibitor being Mr. R. Maher, gr. to A. Waterhouse, Esq., Yattenden Court, Newbury, who was awarded the 2nd prize. His best were Panthea, R. Maher, Marchioness of Bute, Lady Marsham, Juarez, Mr. Hawkins, and Honoria.

The best twelve bunches of Pompon Dahlias shown by amateurs were Mr. J. T. West's, who had bunches of Eva, Fair Helen, Arthur West, Eurydice, Mary Kirk, Achilles, Little Sweetheart, Fanny Keith, Gipsy, and Winifred; 2nd, Mr. Jas. Hudson, who had Hector, Mabel, Iolanthe, Ariel, Janet, Favourite, &c.

Hardy Perennials.—Very fine and effective were the banks of hardy perennials and bulbous plants. The 1st prize fell to Mr. B. Ladham, Shirley Nursery, Southampton, who had an excellent collection, consisting of *Coreopsis grandiflora*, *Stokesia cyanea*, *Lilium* of various types—*L. auratum*, *L. tigrinum*, *L. speciosum*, &c.; *Malva moschata alba*, *Tropaeolum speciosum*, *Rudbeckia purpurea*, *Scabiosa caucasica*, *Gaillardias*, *Pentstemons*, *Anemone japonica* in variety, *Helianthus*, both double and single-flowered, *Liatriis pycnostachya*, *Matricaria inodora fl.-pl.*, *Hyacinthus candicans*, *Trollias europæus*, *Platycodon autumnale*, *Catananche* (silvery), *Phloxes*, *Delphiniums*, *Clematis erecta*, *Lychnis Haageana*, &c. 2nd, Messrs. Paul & Son, Old Nurseries, Cheshunt, who had massive bunches of *Helianthus* in variety, *Lilium*, *Aconitum autumnale*, *Montbretias* in variety, including *crocosmiflora*, *pyramidalis*, *aurea*, *superba*, &c.; *Chelone barbata*, *Physostegia speciosa*, *Gladiolus* in variety, *Anemone japonica alba*, *Rudbeckia purpurea*, &c. Equal 3rd, Messrs. James Cocker & Sons, Sunny Park Nurseries, Aberdeen, and Mr. E. F. Such, nurseryman, Maidenhead.

In the amateurs' classes for the same, Mr. G. H. Sage, gr. to Earl Dysart, Ham House, Petersham, was 1st, with twenty-four bunches, having excellent examples of *Phlox*, *Solidago altissima*, *Pyrethrums*, *Delphiniums*, *Rudbeckia Newmanni*, *R. purpurea*, *Gaillardias*, *Iris Lord Beaconsfield*, *Malva moschata alba*, *Chrysanthemum latifolium*, *Montbretia crocosmiflora*, *Anemone japonica alba*, *Helenium autumnale*, *Gaura Lindheimeri*, *Aster bessarabicus*, *Statice speciosa*, &c.; 2nd, the Rev. F. Paze Roberts, Scolt Rectory, Norfolk, who had a very fine bunch of *Tropaeolum speciosum*, *Statice latifolia*, *Solidago altissima*, *Lilium* in variety, *Rudbeckia Newmanni*, *Papaver nudicaule*, *Plumbago Larpenæ*, *Colchicum autumnale*, *Gaillardias*, *Dianthus monspessulanus*, *Phlox*, *Clematis coccinea*, &c.; 3rd, Miss R. Debenham, St. Albans.

With twelve bunches, Mr. J. Hudson was placed 1st, showing *Phloxes*, *Delphiniums*, a very fine form of the *Bulrush*, *Helianthus multiflorus*, *Gaillardias*, *Anemone japonica alba*, *Helenium pumilum*, *Nymphæa alba*, *Rudbeckia Newmanni*, &c., he being the only exhibitor.

The class for herbaceous flowers, in which Messrs. Kelway & Son offered special prizes, did not bring a single entry.

Bunches of herbaceous *Phloxes* were finely shown by Messrs. Paul & Son, they being placed 1st with twelve in not less than nine varieties, excellent quality characterising all. Messrs. Paul & Son had a dozen distinct varieties, and a better selection for a collection than the following could scarcely be made:—*viz.*, *Boule de Feu*, *Granville*, *John Forbes*, *Baculo*, *Fiambeau*, *Comtesse de Castree*, *Molière*, *William Muir*, *Amsuzone*, a fine white; *Roxelane*, *Caron de Aske*, and *Eugène Dangaverelles*. 2nd, Messrs. Harkness & Sons, nurserymen, Bedale, who had as their best varieties *Lothair*, *Snowdon*, a fine white, *David Syme*, and *James Grieve*.

Collections of *Sundewers*, annual and perennial, inclusive of *Harbolum*, *Helenium*, and *Heliopsis*, were shown by Messrs. J. Burrell & Co. and G. H. Sage, the leading award going to the former, who had bold and striking bunches of *Helianthus multiflorus maximus*, *plenus*, *doronocoides*, *præcox*, *latiflorus*, *Bouquet d'Or*, *rigidus*, and *grandiflorus*; *Rudbeckias* *Newmanni*, *purpurea*, and *laciniata*; *Heleniums*, *pumilum*, *grandiflorum*, and *grandicephalus striatus*, and *Heliopsis scabra*. Mr. G. H. Sage was 2nd, and he included a number of annual varieties in his collection, in the evident belief they were required by the schedule, and they were present

in both double and single forms; also several perennial *Helianthus*, *Rudbeckia*, and *Helenium*.

Violas in twelve pretty sprays were shown by three exhibitors, the 1st prize falling to the lot of Mr. A. J. Rouberry, The Crescent, South Woodford, who had *Countess of Hopetoun*, *Ardwell Gem*, *Blush Queen*, one of Dr. Stuart's new varieties, and sweetly fragrant; *Lillias Improved*, *Lady Dundonald*, *Duchess of Sutherland*, *Lemon Queen*, *Archie Grant*, *Duchess of Fife*, *Gipsy Queen*, *White Flag* and *Goldfinch*. Messrs. J. Cocker & Sons, Aberdeen, were 2nd, with larger flowers of Mrs. Gray, *Duchess of Fife*, *Archie Grant*, Mrs. H. Bellamy, *Clipper*, *Morningfield Rival*, *Dawn of Day*, *Countess of Kintore*, *Bullion*, *Countess of Hopetoun*, *Robert Pirie*, and *Lucy Ashton*. Mr. J. Nicholson, gr. to J. W. Melles, Esq., Sewardstone, Chingford, was awarded a 3rd prize, with varieties similar to the foregoing.

Four collections of *Roses*, arranged for effect, were staged, the 1st prize going to Messrs. Paul & Son, Old Nurseries, Cheshunt, for an imposing one, arranged on the floor. It did seem astonishing that after such hot weather, and so late in the season, such beautiful blooms should have been forthcoming. Standard *Roses* and baskets of cut blooms were used, with dwarf pot plants, and raised baskets also, and arranged with Ferns. The blooms of hybrid perennials, *Teas*, and garden *Roses* were very fine. Messrs. Jas. Cocker & Sons were 2nd, with flowers of wonderful quality, especially among the H.P.'s; the collection consisted of baskets and boxes of cut blooms, interspersed with bunches of *Teas*, and likewise arranged with Ferns. Mr. Geo. Mount, nurseryman, Canterbury, was 3rd, with a delightful bank of blooms, freely arranged, with Ferns at back and front. This was a welcome representation, as showing how effectively cut blooms can be arranged to secure decorative effect. Mr. W. Rumsey, nurseryman, Waltham Cross, also exhibited a remarkably good collection, which well deserved an Award. There was no competition in the class for *Roses* arranged for effect by amateurs.

Of miscellaneous collections of cut flowers there were several prominent among them being a large and valuable representative collection of *Roses* from Messrs. W. Paul & Son, nurserymen, Waltham Cross. From Messrs. Dobbie & Co., seedmen, Rothesay, Dahlias in great variety of all types, some of the show varieties being arranged in panels of colours; bunches of hardy perennials, early *Chrysanthemums*, *Marigolds*—French and African, *Sweet Peas*, *Asters*, *Violas*, and choice selections of vegetables—an exhibit that was a worthy exhibition in itself. Messrs. Barr & Son, King Street, Covent Garden, had a large collection of cut flowers, including many choice bulbous plants, *Gladiolus*, *Pyrethrums*, &c. From Mr. E. F. Such came eleven stands of show Dahlias, including a number of blooms of the new white self, *John Walker*. Messrs. Cutbush & Sons, nurserymen, Highgate, had a large and interesting collection of hardy flowers, Dahlias, &c.; and a similar collection was arranged by Messrs. E. D. Shuttleworth & Co., nurserymen, Pockham Rye. Messrs. Kelway & Co. had collections of fine quilled *Asters*, *Gaillardias*, &c. Messrs. H. Cannell & Sons, nurserymen, Swanley, had a large group of *Cacti*, *Begonias*, *Cactus Dahlias*, and bunches of *Carnations*; and Mr. R. Rawlings, Old Church, Romford, had several stands of fine show Dahlias.

Awards.—Several Awards of Merit were made to seedling Dahlias; the only show variety to gain this distinction was Mrs. Mortimer, a singularly novel and distinct fancy, having a clear bright golden-ground colour, the petals tipped with white, which is suffused with pink, in some cases deepening to brown; it was exhibited by Mr. Mortimer, Swiss Nursery, Farnham. To the following Cactus Dahlias, shown by Messrs. Keynes, Williams & Co.:—*Gloriosa*, bright scarlet, large, and with a tendency to become coarse in petal and outline; *Lady Penzance*, a lovely variety, of the build of *Delicata*, clear, soft yellow, very distinct—a decided acquisition; and *Chancellor*, claret, suffused with purple, very distinct in build and colour, and very fine; and to Messrs. J. Cheal & Sons, nurserymen, Crawley, for *Ernest Cheal*, deep bright scarlet, rich in colour, and a true Cactus. To Mr. C. Turner, Royal Nursery, Slough, for *Pompon Dahlia Rowena*, golden ground, heavily tipped with deep orange-red—fine shape and distinct. To Messrs. J. Burrell & Co., Cambridge, for the following: *Gladioli*, *Orlando*, rosy-salmon, with slight flakes and featherings of pink—fine form and substance; *Gratitude*, a beautiful light delicate blush variety, feather, with soft pink on the petal edges—very pretty and pleasing; *Cassandra*, cream,

suffused with the most delicate pink, yellow throat—very fine and distinct; and Bernice, having a deep cream ground, with slight flakes of pink, and a deep yellow throat. The same award was made to China Rose Duke of York, a deep-coloured variety, having the build of Tea Homère, very fine and distinct, and apparently a great acquisition as an autumn-flowering variety, from Messrs. William Paul & Son, nurserymen, Waltham Cross. Also to Prok Ernest Ladhams, a strong-growing variety, bearing large delicate-bloss flowers, with dark centre; apparently an almost perpetual-blooming variety, but, alas! with the characteristic of most Pinks—a woeful pod-splitter.

Orchid Committee.

Present: Sir Trevor Lawrence, Bart., in the chair; and Messrs. Jas. O'Brien (Secretary), Dr. M. T. Masters, F.R.S., Harry J. Veitch, Thos. Statter, F. Sander, E. Hill, H. Ballantine, and H. M. Pollett.

The exhibits of Orchids were confined to two groups, together with the various specimens submitted to the Orchid committee; although in other groups, such as that of Messrs. B. S. Williams & Son, Messrs. McArthur of Maida Vale, and others, they were used to lend additional attraction to the miscellaneous arrangements.

Messrs. F. Sander & Co.'s collection, for which a Silver Banksian Medal was awarded, embraced many rare species, the most striking of which was the fine *Habenaria carnea*, with its large wax-like, flesh-coloured flowers and prettily-spotted leaves, and a figure of which was given in the *Gardeners' Chronicle*, Dec. 19, 1891, p. 729. It received a First-class Certificate. Another remarkable plant in Messrs. Sander's group was *Aërides Ballantinei* aureum, white and carmine, with bright yellow lip and spur (Award of Merit); and specially noteworthy were the rich violet and purple *Calanthe Sanderiana*, *Aërides Lawrenceanum*, *Zygopetalum (Pescatorea) Klabochorum*, *Peristeria aspersa*, *Acineta Barkerii*, *Miltonia spectabilis Moreliana*, *Lælia × Oweniana*, *Cypripedium × Maynardii*, *C. × Macfarlanei*, *C. × radiosum*, *C. × picturatum*, *C. × Marshianum*, and the pretty *C. × Thayerianum*.

Messrs. W. L. Lewis & Co., Southgate, N., staged an effective group of showy Orchids, among which were some very peculiar and distinct forms of *Cattleya Leopoldi*, *C. Gaskelliana*, *C. labiata*, *C. bicolor*, a pan of *Cypripedium × polystigmaticum*, various species of *Odontoglossum*, *Lælia pumila Dayana*, *Oncidium Jonesianum*, *O. serratum*, *Dendrobium Phalanopsis Schroderiana*, and various other *Dendrobium* and hybrid *Cypripediums* (Silver Banksian Medal).

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. Murray), showed *Cypripedium × Sanderi-superbiens* (*Sanderianum* ♀, *superbiens* ♂?), a first cross with *C. Sanderianum*. It was raised from seeds produced by Captain Vipan, Stibington Hall, and presented to Mr. Cookson. In foliage the plant somewhat resembles *C. Curtisii*, and the flower, *C. × Morgania*, but it is broader in the petal and exhibits some of the undulation on the upper part of the petal, as in *C. Sanderianum*; but altogether the difference is not so pronounced as might have been expected (Award of Merit).

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed *Cypripedium × Edwardii* (*superbiens* ♀, *Fairrieanum* ♂), with much of the form of *C. × vexillarium*, but with a whiter ground colour, and brighter rose-purple markings (Award of Merit). Mr. Statter also showed flowers of *C. × Chas. Canham*, *Cattleya granulosa superba*, and *C. g. tigrina*, exceptionally good.

Messrs. McArthur, the London Nurseries, Maida Vale, showed a form of *Cypripedium niveum*, with some rayed purple lines, named *C. n. radians*. The Hon. Mrs. Foley, Fordingbridge, Hants (gr., Mr. Moxham), showed *Cattleya Leopoldii*, *Pernambuco* var.; and Major Joicey, Sunningdale Park, Sunningdale (gr., Mr. Fred. J. Thorne), sent a good form of *Cattleya Alexandrae*, and *Cypripedium × barbatum × selligerum*, the latter a very pretty dark hybrid, not very far removed from one of the large forms of *C. barbatum*.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. H. Balderson, P. C. M. Veitch, Geo. Taber, G. W. Cummins, Alex. Dean, Henry J. Pearson, W. H. Divers, John A. Laing, F. Q. Lane, Geo. Wythes, S. T. Wright, Robert Hogg, J. Cheal, Geo. Reynolds, J. Wright, J. W. Bates, Geo. Woodward, William Bennett, and J. Willard.

Miscellaneous.—There were collections from most of the leading nurserymen, and from some amateurs,

several of the groups of orchard-house trees, and fruit from outside and inside being especially good and attractively set-up.

The only Gold Medal was awarded to Messrs. T. F. Rivers & Son, Sawbridgeworth, for a collection of fruit trees in pots, and a few samples of orchard-house fruit. The trees were of the usual form exhibited by the firm, and attracted considerable attention. There were Vines well fruited, including Gros Maroc, Golden Queen, Gros Colmar, and Dr. Hogg, the latter being but poor. A seedling Peach was a splendid crop on one finely-formed tree, and the fruit is exceptionally large and good looking. Another seedling is of a pretty Apricot colour. Amongst the fruits exhibited were excellent Apples, Pears, Plums, and some varieties of Crabs.

Messrs. Jaa. Veitch & Sons, Chelsea, staged a collection of Apples, Pears, and Plums, in 200 dishes, exclusive of a few baskets. Particularly noticeable amongst the Apples, were Frogmore Prolific, Seaton House (a very pretty variety), Lord Suffield, Peasgood's Nonsuch, Alfriston, Cellini Pippin, Lord Derby, Tower of Glamis, American Mother, Ribston Pippin, Benoin, Worcester Pearmain, Scarlet Russet, Scarlet Pearmain, Calville Noopareil, Kerry Pippin, and Devonshire Queen. The Pears are not quite so large this season. A good collection of Plums, including many of the leading kinds, was included, and some nice little Fig trees for forcing (Silver-gilt Knightian Medal).

A very fine collection of fruit, with a row of excellent orchard-house trees down centre of table, was shown by Messrs. Geo. Bunyard & Co., including Apples, Pears, Plums, Peaches, Vines, &c.

Amongst the fruit shown in dishes, such Apples as Duchess of Oldenburg, The Duchess Favourite, Lord Suffield, Lady Sadeley, Yorkshire Beauty, Grenadier, the highly-coloured Duchess of Gloucester, and several others, were noticeable. Of Pears, the best specimens were Grosse Calebasse, Dr. Jules Guyot (a capital Pear), Benrre Clairgean, Madame Treyve, Doyenné Bonsoch; a few Nuts, Damsons, Grapes and Plums were included, also some Fig trees in pots just nice for forcing, and some well rooted runners of Strawberries (Silver-gilt Knightian Medal).

Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, had also a capital collection of fruit, and a few trees in pots. The quality of the Apples and Plums was of equal merit to the other collections, and a Silver-gilt Knightian Medal was awarded here also.

A large collection of fruits, and also a first-rate group of orchard-house trees, were staged by Messrs. Wm. Paul & Son, Waltham Cross, Herts (Silver-gilt Knightian Medal). For a collection of fruit of good quality, Messrs. S. Spooner & Sons, Hounslow, were awarded a Silver Knightian Medal.

A first-rate lot of Apples came from South Wales, shown by Mr. Bytheway, Llanelly, Carmarthenshire. They were of excellent quality, and large size, especially Sandringham, The Queen, Mère de Méuage, Peasgood's Nonsuch, Tom Putt, Tower of Glamis, Cellini, Bramley Seedling, Warner's King, &c. (Silver Knightian Medal).

Collections of fruit also were from Messrs. J. Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E. (Silver Banksian Medal). A collection of Onions from Mr. T. Wilkins, Inwood House, Henatridge (Silver Knightian Medal). A collection of Onions from Messrs. H. Cannell & Son, Swanley (Silver Banksian Medal). A collection of dried fruits and vegetables from W. A. Trotter, Esq., Broomperrow (Silver Knightian Medal); and a collection of Grapes grown without artificial heat, from Mr. J. Clarke, Albion Nursery, Farnham (Silver Banksian Medal).

Miscellaneous Vegetables included a collection of twelve varieties of large Onions, from Mr. Wilkins, which included Ailsa Craig, Wroxton, Sutton's A1, Cocoa Nut, Excelsior, Rousham Park Hero, and Royal Jubilee. Messrs. H. Cannell & Sons had also a collection in considerable heaps of Improved Wroxton, Ailsa Craig, Cannell's Globe, Somerset Hero, &c., also Shalots and other bulbs. Mr. Young showed a handsome white seedling Kidney Potato, Barton Court Perfection; and Messrs. Dobbie & Sons set up a handsome collection of vegetables including Champion Leeks, very fine selected red and white Celeries, Golden Ball Turnips, a beautiful sample of fine Parsnips, Beet, and other roots, and some admirable garnishing Parsley in pots.

Messrs. Alex. Cross & Sons, 19, Hope Street, Glasgow, had a collection of fruits, showing the effect of using their "Cross's Garden Fertiliser."

Mr. Jos. Fitt, Panshanger Park Gardens, had two bunches of Bananas, which were Culturally Com-

mended. Seedling Melons were shown by Mr. Owen Thomas, of the Royal Gardens, Windsor. E. Hart, Esq., Fairlawn, Totteridge, Herts (gr., Mr. J. Smith), and the Earl of Shrewsbury, Ingeatree Hall (gr., Mr. Gilman). Tomatoes were sent by Messrs. Carter & Co., Holborn, and by Mr. Jno. Ailsop, The Gardens, Dalton Hall; and Messrs. Hazel Bros., 35, The Broadway, Crouch End, London. Mr. W. H. Divers, Ketton Hall, Stamford, sent a seedling Peach; and several exhibits of Apples from growers within the 4 miles circle, were Culturally Commended.

Mr. J. Miller, gr. to Lord Foley, Ruxley Lodge, Esher, had two good dishes of Peaches; and there were several seedling Peaches from Messrs. Robert Veitch & Son, Exeter.

COMPETITIVE CLASSES.

The fruit competition was well sustained generally, and an immense amount of produce was of first-rate quality. The weakest in this division were the Grapes and Pears, the latter being a little small.

In the first-class, that for a collection of twelve kinds of fruits, there was but one exhibitor, Sir J. W. Pease, Bt., Hutton Hall, Guisborough, Yorks (gr., Mr. J. McIndoe). The collection contained good Peaches, excellent Apples, a fair Melon, and average quality Grapes. The exhibit generally, though, was not quite up to Mr. McIndoe's usual standard, and a 2nd prize only was awarded. The same exhibitor, however, was 1st in the collection of six kinds, and in sharp competition. He had, of Grapes, Black Alicante (very fine), and Muscat of Alexandria; also Peaches, Nectarines, a Melon, and Williams' Bon Chrétien Pears. The 2nd place was taken by the Countess of Camperdown, Weston House, Shipston-on-Stour (gr., Mr. J. Masterson); his Muscat of Alexandria Grapes were good, and the collection was a good one. Ralph Saeyd, Esq., Keele Hall, Newcastle, Staffs. (gr., Mr. J. Wallis), was 3rd, and there were two other entries.

Messrs. De Rothschild, Gunnersbury Park, Acton (gr., Mr. G. Reynolds), were 1st for three bunches of Muscat of Alexandria Grapes, open only to amateurs, and obtained a Silver Cup, value £5, presented by the Turner Memorial Trustees. Mr. J. Masterson was 2nd; and Mr. Lewis Jordan, Holndenby House Gardens, Northampton, was 3rd. The Muscats, though good, were not exceptional.

For three bunches of Black Grapes (amateurs), a similar Silver Cup to that awarded in the preceding class was obtained by E. Miller Mundy, Esq., Shipley Hall, Derby (gr., Mr. W. Elphinstone), large in berry and bunch, and of good colour; Messrs. Rothschild were 2nd; and Mr. W. Messenger, Woolverstone Park Gardens, Ipswich, 3rd.

Messrs. Rothschild were 1st for three bunches of any white Grape other than Muscat, with Buckland Sweetwater; and L. J. Baker, Esq., Otterabaw Park, Chertsey (gr., Mr. T. Osman), was 2nd with Mrs. Pearson.

In the same class for black, other than Hamburgs (amateurs), C. Lee Campbell, Esq., Glewston Court, Ross, Herefordshire (gr., Mr. S. T. Wright), was 1st, with excellent Alicante; H. Tate, Esq., Park Hill, Streatham Common (gr., Mr. W. Howe), 2nd, also with Alicante; and Messrs. de Rothschild, 3rd, with Gros Maroc.

The next class was an open one for four dishes of Peaches, distinct, six fruits to a dish, and the 1st prize was obtained by J. T. Hopwood, Esq., Ketton Hall, Stamford (gr., Mr. W. H. Divers), who had Princess of Wales, Barrington, Sea Eagle, and Prince of Wales. They were very fine well-coloured fruits. Roger Leigh, Esq., Barham Court, Maidstone (gr., Mr. Geo. Woodward), was 2nd; and Sir Mark Collet, Bart., St. Clare, Kensing, Sevenoaks (gr., Mr. R. Potter), 3rd, who showed a very fine dish of Exquisite. W. K. D'Arcy, Esq., Stanmore Hall, Great Stanmore (gr., Mr. Wm. Tidy), had the best two dishes in the amateur class, with Late Admiral and Sea Eagle; Mr. McIndoe was 2nd, and Mr. Elphinstone, 3rd.

Messrs. de Rothschild had the best eight varieties of Grapes, two bunches of each (open), consisting of Chasselas Napoleon, Madresfield Court, Muscat of Alexandria, Black Hamburg, Trebbiano, Gros Maroc, Alicante, and Mrs. Pearson; C. Bayer, Esq., Tewkesbury Lodge, Forest Hill (gr., Mr. Bury), was 2nd; Mr. J. Wallis, 3rd.

The premier position for four dishes of Nectarines distinct, six fruits to a dish (open), was taken by Mr. J. McIndoe, who showed Byron, Pineapple, Spencer, and Humboldt; but in our opinion, they were inferior to the collection for which Mr. Geo. Woodward was awarded 2nd, these fruits being considerably larger and better coloured. They were

Stanswick Elruge, Rivers' Orange, Pitmaston Pine-apple, and Humboldt. Sir Mark Collet was 3rd.

In the class for two dishes (amateurs), Mr. W. H. Divers was 1st, with Spenser and Pine-apple, and Mr. J. Wallis 2nd. The two best Melons (amateurs), were staged by Mrs. McIntosh, Havering Park, Romford, Essex (gr., Mr. A. Ocock), who had one fruit of Countess, and a seedling. Mr. W. Messenger was 2nd, and Mr. J. Masterson, 3rd.

Mr. J. McIndoe had the best four dishes of Plums (amateurs), nine fruits to a dish, showing excellent Washington, Prince Englebert, Jeffersons, and Magnum Bonum; and Jno. Hargreaves, Esq., Maiden Erlegh, near Reading (gr., Mr. Thos. Turton), was 2nd. In the latter exhibit, Pond's Seedling was very fine. The only competitor in the class for a collection of Plums (open), was Mr. J. McIndoe, who staged a very fine lot, including a good number of varieties, and was awarded 1st prize.

For six dishes of Apples, distinct, six fruits to a dish (open), the best lot was from Mr. Geo. Woodward, who had fruits of excellent size and quality. They were Peasgood's Nonsuch, Emperor Alexander, Warner's King, New Hawthornden, Washington, and Lord Suffield. The 2nd place was well taken by Mr. Geo. Chambers, Beech Farm, Mereworth, Maidstone; and Viscountess Portman, Buxted Park, Uckfield, Sussex (gr., Mr. H. C. Prinsep), was 3rd.

Pears were shown in a class for three dishes, and the 1st prize was taken by the Earl of Cowley, Draycott House, Chippenham, Wilts (gr., Mr. J. Gibson), who had very large but green fruits of Pitmaston Duchess, Duchess of Angoulême and Beurré Clairgeau. Mr. Geo. Woodward was 2nd, his fruits were smaller but ripe, the varieties being Dr. Jules Guyot, Durondeau, and Williams' Bon Chrétien. Mr. J. Masterson was 3rd.

For a collection of hardy fruits (amateur), the best lot were sent by Mr. Geo. Woodward, who showed of Apples, Peasgood's Nonsuch, Northern Dumpling, Yorkshire Beauty, Stone's, Ribston Pippin; Pears, Triomphe de Vienne, Dr. Jules Guyot, and Pitmaston Duchess; also five dishes of Peaches, three dishes of Nectarines, and two dishes of Plums—a first-rate collection. Mr. McIndoe was 2nd, and he included other than those represented in the 1st prize collection, Apricots, Gooseberries, Red Currants, Cherries and Nuts; Mr. S. T. Wright was 3rd.

In the open class for a collection of Apples, Messrs. Geo. Bunyard & Co., Maidstone, took leading position, staging 120 varieties. The general quality was good, some varieties below average, and others very much beyond. Warner's King was a very strong dish, but Peasgood's Nonsuch was small, whilst Pott's Seedling is not quite up to first-class form this season. Golden Spire, Okera (a new Russian variety), and Ribston Pippin, were especially noticeable. The exhibit created an immense display, and the same firm took leading honours in a similar class at Birmingham on the same day, also staging 120 varieties there; the 2nd prize was obtained worthily by the English Fruit & Rose Co. (Cranston's Ltd.), King's Acre, Hereford, who had one hundred varieties and in good quality, and the 3rd position fell to Messrs. Paul & Son, Cheshunt.

The best three dishes of dessert Apples (to include Lady Sudeley) amateurs, came from Mr. Geo. Woodward, who had Washington, Lady Sudeley, and Ribston Pippin; and the same exhibitor was also 1st in a similar class for kitchen Apples, with large fruits of Peasgood's Nonsuch, Stone's, and Warner's King. Mr. Geo. Chambers was 2nd, and Mr. Thos. Turton 3rd.

Messrs. Bunyard & Co. were the only exhibitors in the class for nine orchard-house trees in fruit, distinct varieties (open), but the plants were of good quality and well fruited.

The last competitive class was for a collection of orchard-house fruit (amateurs), Peaches and Nectarines excluded. The 1st prize lot shown by Mr. J. McIndoe, was of exceptional quality, and well deserved the premier position; the competition being rather keen. He had very fine Oranges, Lemons, also Apples, especially Gascoigne's Seedling, Figs, Plums, and Pears, also a dish of the edible Passiflora, and one of Guava. Mr. R. Potter was 2nd, and his collection was a good one, a dish of Beurré Baltet Pear was exceptionally strong; J. W. Mellea, Esq., Sewardstone Lodge, Chingford, Essex (gr., Mr. J. Nicholson), was 3rd.

VEGETABLES.

The exhibits in this section were limited in number, but the quality was generally excellent, some indeed being first-class. In the competition for twelve distinct kinds, three competitors

showed in round baskets, and seriously injured what is usually regarded as effect in staging. Mr. Waite, gr. to the Hon. Colonel Talbot, Glenhurst, Esher, was placed 1st, his collection being in one large flat. It comprised very fine Early Rose Celery, Ailsa Craig Onions, Autumn Mammoth Cauliflowers, very handsome Student Parsnips, Intermediate Carrots, Snowball Turnips, Globe Artichokes, Glenhurst Favourite Tomatos, Pragnell's Beet, Satisfaction Potatos, Ne Plus Ultra Runner Beans, and Champion Leeks, altogether a capital lot. Mr. Wilkins, another champion grower, gr. to Lady Theodora Guest, Inwood House, Henstridge, had his exhibits in two smaller baskets, and included huge Ailsa Craig Onions, Giant White Celery, huge Satisfaction Potatos, Lyon Leeks, Ne Plus Ultra Peas, Perfection Beet; and Mr. Robert Watson, Lanark, N.B., whose collection was laid on the table, was placed 3rd. Only one exhibitor, Mr. C. Payne, gr. to W. A. South, Esq., Neasden, competed in the class for six kinds, his quality being moderate. Mr. Waite was again 1st in the class for six kinds, prizes given by Messrs. Jas. Carter & Co., all good things. Mr. Payne was the only other exhibitor. Mr. Waite was the only competitor with a collection of salads, having a big flat basket handsomely filled, and dressed with Celery, Cucumbers, Tomatos in variety, Radishes, Lettuces, various Beet, Mustard and Cress, Shalots, &c.

There were five competitors in the class for twelve dishes of Potatos, the 1st prize going to a well-known Kentish grower—Mr. Chopping, of Sittingbourne, who had beautiful samples of Satisfaction, Sutton's Seedling, Fidler's Monarch, Prime Minister, and Epicures' Delight, white; and Lord Raglan, and Mottled Beauty, purple blotched; Edgote Purple, and Herde Laddie, purple; Lillie Laugtry, and Reading Russett, red. Mr. Waite was a very good 2nd, having clean samples of Reading Giant, Snowdrop, Sutton's Supreme, Cole's Favourite; Vicar of Laleham, Mr. Breese, and others. Mr. W. Young, The Gardens, Barton Court, Berks, was 3rd. Mr. Chopping was again 1st, and Mr. Waite 2nd, for six dishes, the same kinds as mentioned being employed. This competition was for Messrs. Jas. Carter & Co.'s prizes. Five lots of three dishes of Tomatos were staged, all good, and all so greatly alike. The finest came from Mr. W. Howe, gr. to H. Tate, Esq., Streatham Common, who had Ladybird, Sutton's Perfection, and Silver's Invincible; Mr. Ryder, Northumberland Nursery, Orpington, was 2nd, with Hamgreen Favourite, Perfection, and Trophy; Mr. Tidy, gr. to W. R. D'Arcy, Esq., Great Stanmore, was 3rd with six of the largest and handsomest Onions of Deverill's strains. Prizes presented by H. Deverill, Banbury, Mr. Wilkins 1st with huge Lord Keeper, Mr. Waite coming 2nd, with smaller but very handsome Ailsa Craig, the requirements of the schedule evidently being found hard to fulfil. For Dobbie's Champion Leek, very liberal prizes being offered by Messrs. Dobbie & Sons, Rothsay, N.B., six fine lots were staged, Mr. D. Gibson, gr. to C. M. Dubs, Esq., Lymington, Ayrshire, was 1st, having splendid examples, blanched pure white, 12 inches long, and of good size; Mr. Findlay, Beaulieu, Hants, was 2nd; Mr. R. Watson, 3rd.

HORTICULTURAL APPLIANCES, BOILERS, GREEN-HOUSES, &c.

The exhibits under this head were arranged around the Hall, under the galleries, and considering that this is the first exhibition of just this character which has been held in this place, it must be pronounced that the various trades connected with horticulture, have supported the Royal Horticultural Society very well indeed. There was, it is true, space for many more exhibits, and had the exhibits been grouped *en masse*, a far more imposing display would have been made, but this was impracticable, and as it was, plenty of space was afforded for inspecting each stand.

Horticultural Erections and Heating Apparatus.—Amongst the more practical exhibits were those of Messrs. Foster & Pearson, Beeston, Notts, who are well-known for the good quality of their work. They exhibit specimens of houses, well-constructed and arranged as regards the heating apparatus and ventilation. The Beeston "amateur's" house is rather excessive in width, making it awkward to reach the plants against the front lights from the central pathway, but this is a detail which might easily be remedied. The exhibit of a fruit-case is an excellent design for the purpose of protecting tender wall-fruits. Their cold-frames are, as regards arrange-

ment and structure, all that one can desire. Various patterns of boilers are shown both for large and small houses. One of the latter is in work, and shows effectiveness with economy in the use of fuel. The firm also exhibit their pattern of valves, which are great improvements as regards the ease with which the cleaning can be done, and in durability. An award of a Silver-gilt Flora Medal for general excellence was made, the house was Commended, and the frames Highly Commended.

Messrs. Messenger & Co., Loughborough, also exhibited well and extensively in this section. They had an erection wherein are shown different systems of ventilation and other interior arrangements. The side-ventilation, by means of a revolving screw, is one of the best systems of gearing yet brought out; it is self-locking in its working, it being impossible to shift the lights, yet the screw works with the greatest ease. The same adaptation is shown for top-ventilating gear. Another method of side-gearing is taken from the usual form of switch-handles of the points on railways, that is, with a spring; this is also a good plan. The wiring and arrangements for in-straining, as well as for tightening the roof, in place of the old tie-roads, are very light and effective. A slate-bed for houses is exhibited also; far more of this material should be used, being much cheaper in the end than wood. Award for this house and its arrangements, including heating arrangement, Silver-gilt Flora Medal.

Messrs. Sam Deards & Co., Harlow, exhibited their system of dry-glazing in operation, with water running down the roof, the house being at the same time light inside. They also showed their large coil boilers, which are powerful and effective. Another very useful arrangement was an adaptation of a self-feeding arrangement and coil to the interior of the "Prince" boiler, very serviceable for small cultivators and amateurs generally, economising fuel with the least amount of attention. This last-named boiler is an improvement upon Walker's slow combustion-stove, and a Silver Banksian Medal was awarded to it.

Heating by gas was shown in operation, and for small houses will, no doubt, be useful. Messrs. C. Toope & Son, Stepney Square, E., showed in this section several of their designs, which are of excellent make and finish; these received a Silver Banksian Medal for their practical utility. Messrs. Feulon & Son exhibited their patent gas-boiler, in which rapidity of action and economy of gas are conspicuous, the arrangements for the former being excellent (awarded Silver Banksian Medal).

New Automatic Damper.—This exhibit, by Mr. C. Lascelles, 97, Fleet Street, E.C., was the only one of its kind; it is simple, ingenious in construction, and efficient in working. The expansion of the water in the feed-cistern, as it gradually increases in heat, causes the damper to close in a corresponding degree by means of a float on its surface, the temperature being furthermore regulated by a screw arrangement to adjust the damper. A Silver Banksian Medal was awarded to this novel exhibit.

Summer-houses, and seats of rustic make, were shown by Mr. G. W. Riley, Herne Hill, S.E. These are of first-rate make, strong, durable, and useful, and far better than formal buildings for the purpose. Awarded a Silver Banksian Medal.

In gardening implements, the "Standard" Manufacturing Company, Derby, received a Silver Flora Medal for further improvements in their tree pruners, which are both powerful and labour-saving, and for other exhibits of a similar kind, all of good workmanship.

Messrs. Clark & Co., Park Street, Islington, showed gas and oil heating stoves, useful in small plant-houses, but more so in seed shops and warehouses, or in offices and entrance halls; these are of upright construction, and occupy but little room. The judges Commended this exhibit.

Other exhibits in the foregoing sections comprised a number of small greenhouse erections in various patterns, with heating apparatus and frames as well, by Mr. W. Cooper, Old Kent Road; those for small growers and beginners are all one could desire. The Stott Patents (Barton House, Deansfall, Manchester, John J. Scott, Secretary) are shown; these are so well known, being largely used in many gardens and nurseries, as to need no further recommendation. These implements bear on the face of them the stamp of first-class workmanship. Messrs. Newton & Co., Horticultural Builders, Hitchin, show their improvements in the erection of houses with steel roof-bars, blinds and shadings, the glazing of the roofs being without putty, the various arrangements being all of sound and durable make. A

section of a roof is shown, constructed of partly-bent sheets of glass, the top of the house consisting of ordinary flat panes, whilst the angle is got rid of by the use of bent-steel T sash-bars, and plates bent to fit them. It is light and strong, and elegant in design.

Miscellaneous exhibits of horticultural sundries were extensive and comprehensive. Messrs. Osman & Co. received a Silver Flora Medal for all sorts of accessories for the garden, chief amongst which were well-made implements of different kinds, light and strong boxes for parcel-post, improved iron stakes, as well as boxes for carrying cut blooms to exhibitions, and boards to arrange them on; a trap for catching wire-worms is of simple but sensible make; smaller enndries are also included, amongst which were a capital sample of Raffia, garden knives, &c. Messrs. H. & E. Albert, Gracechurch Street, E.C., showed their chemical manures, and results therefrom. Mr. J. T. Anderson, Commercial Street, E.C., had an extensive stand of sundries of all kinds, but more particularly samples of shadings of the best patterns, garden mats, which are an important part of the business, Bamboo stakes, garden netting, sacks, and bags, with implements.

Insecticides and Manures, Twines, and Cords.—Messrs. Coates & Everett, Tanners Hill, S.E., had an exhibit of their Fur-line Anti-incrustator, which should prove most valuable in the case of furring in pipes where the water is hard. Mr. W. Colchester, Ipswich, had samples of Ichthemic guano, an excellent fertiliser, in which the high percentage of nitrogen is the chief constituent. Messrs. Cooper, Dennison, & Walkden, St. Bride Street, E.C., showed "Improved Paper, Fruit, and Flower Baskets" in variety; useful and light articles as well as strong. Messrs. Corry & Co., Finsbury St., E.C., had a large number of horticultural exhibits of all kinds in which garden tools, insecticides, manures, and stakes are the chief features, making in all an excellent display. Messrs. A. Cross & Son, Glasgow and Mark Lane, showed their fertilisers, which are proving to be amongst the best (J. 11) in present use. They also show their insecticides, that for mealy-bug being most effectual.

Another exhibit here was composed of spray syringes, which effect a great saving in the liquid when using various compositions. Mr. W. G. Davis, 104, High Holborn, W.C., showed chemical and other manures, which as regards their efficacy, were exemplified by specimens of growth shown side by side.

Mr. J. George, horticultural sundriesman, Putney, had a large stand, on which were shown excellent examples of his Mushroom spawn, of Orchid and other roots of the best qualities; Thomson's Vine Manure, for which he is the London agent, and fumigating with other well-tried insecticides, also everyday garden requisites. Messrs. Sly, Dibble & Co., Colonial Avenue, Minories, E.C., had a large stand of sundries in variety, amongst which are artificial wreaths; these do not encourage floriculture, unless it be to create a desire for real flowers in their stead. Messrs. W. Wood & Son, Wood Green, N., had a large and showy stand, over which was erected a light framework of Bamboos, to show their utility other than as flower-stakes, of which also large quantities in different sizes are shown; wood-wool for packing purposes was to be seen here in the best quality; the firm also staged their manures, which are so well-known in gardens; peat of the very best quality and variety, and insecticides also were included, the whole an excellent exhibit. Mr. W. Cooper had also an exhibit of sundries, comprising useful requisites for the garden. All important for the garden was the disinfecting Compound Liquid of Messrs. B. Lawes & Co.

ROYAL SCOTTISH ARBORICULTURAL.

(Continued from p. 245.)

The New Forest.—Early on Thursday morning the steam-ferry conveyed us over Southampton Water to Hythe, where carriages were in waiting to take us over the wide open moor of Beaulieu Heath to the pretty village of Beaulieu, and on to the New Forest. Here the long lamentations of the proverbially thrifty began, the contemplation of the vast area of waste land, all of which might at least bear Scots or Douglas Fir, being provocative of much strong language. The quaint village of Beaulieu, at the head of the estuary of the Exe, which has a course of 9½ miles to the Solent, with the picturesque ruins of the Cistercian Abbey, temporarily changed the current of our thoughts. Round the green turf of the cloister garth, the ruined walls presented a charming aspect. Clematis, Myrtle, and Magnolia,

all in full flower, clustered over crumbling white Binstead stone from the Isle of Wight, and slender shafts from that of Purbeck. The huge rough timbers of the open roof of the great dormitory, supposed to be Chestnut, revived a controversy broached on the previous day at Windsor; and, after inspecting the site of the great Minster Church, in a visit to the museum in the ambulatory, sharp eyes detected some of the original resin adhering to the Purbeck marble matrix of a monumental brass. The refectory, now the parish-church, is noteworthy from the fine stone-pulpit with a groined arcaded approach, with Purbeck shafts, and from its gracefully-proportioned lancet windows.

Re-joining our carriages, and regaled by Apples kindly given us by Mr. Phillips, of Penlee, we then entered the New Forest, driving due northward to Lyndhurst. Each member of the party had been previously provided with a copy of W. H. Rogers' excellent Guide, and with a paper entitled "A Brief History of the Arboriculture of the New Forest," by the deputy-surveyor, the hon. Gerald Lascelles, from which we take the liberty to make somewhat copious extracts.

The Forest covers 92,345 acres, but this includes 27,658 acres of private property, leaving 64,737 acres, or over one hundred square miles of Crown land. Of this, 40,478 acres, nearly two-thirds of the whole, is open heath and pasture, and of this Mr. Lascelles writes: "About 30,000 acres were described in 1819, by one of the most eminent firms of land agents in this country, as being 'unfit for either agriculture, growth of timber, or pasturage.' If this description was applicable at that date, it is infinitely more so now, when prices for all kinds of farm and forest produce are at their lowest ebb." If at their lowest ebb, it may be urged that prices must rise; but if not, prices do not affect the actual fertility of the land (apart from the question of immediate monetary return); whilst it is noteworthy that as to the worthlessness of these 30,000 acres, Mr. Rogers adds the saving clause "except for the growth of Scotch Fir." Mr. Rogers speaks of "the ancient natural woods;" but, though no one seeing the barren sands and gravels can believe the legend that the Conqueror laid waste a fertile agricultural district to make a woodland, it may well be doubted whether any "natural woods" now remain in Hampshire. Mr. Lascelles attributes all the old woods to early enclosure, which (without stating his authorities) he states was known as "encoppicing." The deer and cattle were, he says, excluded by a fence, natural regeneration relied on, and the right of cutting the underwood leased for a term of years. All timber was taken for the navy, and no "shrouding" (or lopping) or cutting "by the ground" (or coppicing) was allowed to be done by the tenant. James I., our first Scottish king, ordered a survey of the Forest in 1608, when 123,927 trees fit for naval purposes were found, containing 197,405 loads of timber. In 1707, after a century of neglect and waste, only 12,476 such trees remained, containing 19,873 loads. In 1698, the first Enclosure Act was passed, apparently an excellent measure, by which it was provided that 200 acres should be enclosed annually for twenty years, and that as soon as any of the land thus enclosed was safe from damage by cattle, it should be thrown open, and the like area enclosed in its stead. Pollarding was then abolished. Between 1761 and 1787 nearly £88,000 worth of timber was cut in the Forest; and in 1776, though only tentatively at first, the Scots Fir was introduced, Ocknell clump being planted on the worst soil and with the worst exposure in the Forest.

Under the influence of the great wave of utilitarian enclosures of waste land then prevailing, the Act known as the Deer Removal Act was passed in 1851, by which some 32,000 acres in all were to be enclosed for timber, in exchange for the cessation of the exhaustion of the commoners' pasturage by the protected deer. "The manner in which these enclosures were carried out gave," we are informed by Mr. Rogers, "great dissatisfaction. It was the custom when a tract was selected for enclosure to first clear it 'snack smooth' of every tree of whatever kind that might be upon it, and then to plant it, either with Firs, or with Oaks and Firs in alternate rows. The commoners complained that they were unfairly (!) deprived of the best grazing ground for their cattle, and every lover of the picturesque, and student of nature, shuddered with horror at learning that so quickly were the most beautiful old woods disappearing, that in twenty-five years nearly half of them had been cut down, and that so extensive had the votes of enclosure become, that any day, at one vote, all the rest might be con-

demned to the axe." To this Mr. Lascelles replies that the felling was in part due to no timber having been supplied to the navy since 1833; that the plantations then felled had been made in William III.'s time, expressly to be cut when mature for the navy; that every wood felled "was replaced by a young plantation, which is in most cases now producing a crop of Oak that, at an equal age, will vie with, or surpass, the older wood which it has replaced;" and that the commissioners were bound to grow wood for naval purposes, and therefore to select the best soil for that purpose.

These arguments seem to us unanswerable. The picturesque character of regular plantations with coniferous nurses is only temporary; and, if there is not an unbroken succession of Oak and Beech plantations, in the full beauty of approaching maturity, it is owing to past neglect or irregularity of management, the only sound method of remedying which was that then adopted.

The disuse of Oak in naval architecture, and the increased æsthetic value of open spaces and picturesque woodlands, did undoubtedly to some extent justify the reaction which culminated in the formation of the New Forest Association in 1867, the Select Committee of 1875, and the New Forest Act of 1877; but this Act, under which the Forest now suffers, was based on hopelessly false principles, and is utterly unworkable. It requires "that the ancient ornamental woods and trees of the Forest shall be preserved, and * * shall remain open and unenclosed," and at the same time "that no fresh land shall be taken for enclosure." This is to require an impossibility. Planting and clearing being alike practically put an end to, the beautiful old woodlands, which are certainly artificial in origin, and not primeval or natural forest, are in the course of nature falling into decrepitude and decay, whilst no provision is allowed for their renewal. "Arboriculture is," as Mr. Lascelles says, "for the present dead, in the chief national forest."

While we were arriving at these somewhat depressing conclusions our vehicles were slowly traversing the rough road past the barrows that mark the prehistoric occupants of Beaulieu Heath, and past the lawn-bordered woodland, known as the Bishop of Winchester's purlieu, which tradition relates to have been the guerdon of a crawl round the estate performed by an ancient holder of the see in a single night, on to the central village of Lyndhurst. Here we were met by Mr. Lascelles, and sat down to lunch in the New Forest Picture Gallery, under the chairmanship of Colonel Bailey, the ancient Verderer's Hall not being large enough to accommodate us.

The hall was, however, visited after luncheon, and the ancient axe-hewn prisoners'-dock, and the celebrated "Rufus's stirrup" were duly inspected. The latter is a large and somewhat singularly shaped stirrup, probably in reality of Tudor date, which was long used as a gauge for small dogs which might be kept in the Forest, as not harmful to the deer. Any dog unable to pass through the stirrup was "expedited," i.e., had the hall of the foot cut off, to prevent its doing any mischief. The Hall is part of the Queen's House, the official residence of Mr. Lascelles as deputy-surveyor.

Having rejoined our carriages, we soon dismounted again for a rapid walk across Cuffnells, the estate of Reginald Hargreaves, Esq. Here the first tree of interest was a fine specimen of the Luccombe Oak. A well-grown Redwood (*Sequoia sempervirens*) and a Wellingtonia, over 60 feet in height, and stripped artificially of its lower branches, as is done by Nature in the closer quarters of the Yosemite Valley, next attracted attention. Crossing the terrace, where the house-front was adorned with fine Myrtles, Lemon Verbena (*Aloysia citriodora*), and the less common *Edwardia grandiflora* of New Zealand, a magnificent Douglas Fir was the next stopping-place. It proved to be 10½ feet round and 80 feet in height. Noting that here the Cherry Laurels were as much laden with ripening fruit as are almost every species of tree during the present season, we drove on, passing Bank, the residence of the novelist universally known as Miss Braddon, and Alum Green, to the old toll-gate at the lovely stream known as Highland Water. Soon after crossing this we again had a short walk into the enclosure in which stands the celebrated Knightwood Oak. This magnificent tree, still in vigorous growth, girths 19 feet 8 inches, at 5 feet from the ground, and besides several gigantic erect limbs, for it is a pollard, sends out one horizontally to a distance of about 24 yards. Crossing the high road, we then drove through the interesting enclosures known as Rhinefield, where the Forest nurseries were situated, and

where many fine ornamental Conifers, such as Silver Fir, Pinesapo, Douglas Fir, and others have been planted experimentally. These fine trees amidst the Rhododendrons and Barberry bushes, bright with fruit, were interesting as trees; but had an essentially exotic and garden aspect, rather than that of a forest plantation.

Retracing our steps through a part of Knightwood enclosure (successfully planted with Pinus Laricio, and passing some newly-planted Scots Firs, notched in on the site of a recent fire, which in this dry season had largely fallen victims to the Pine-weevil), we reached the two fine Beeches of Mark Ash. One of these giants is quite dead, and the other seems very nearly so; and some conversation arose as to how far this was merely the effect of old age, and how far it was that of starvation in the poor soil, intensified (as this evil influence is) by a carriage-track beneath the tree. The appearance and slaughter of one of the adds which abound in the forest created a diversion, and shortly afterwards we reached the yet more interesting district of Bolderwood. Here there was a rush to the woodman's cottage for some water, the heat being very trying, and, though all the party saw the well-known "King" and "Queen" Oaks, the fine Yews, and some of the other Conifers, some of them got separated, and lost the sight of some specimens of Cupressus Lawsoniana, really worthy of consideration as timber-trees. The King and Queen Oaks are merely wrecks, though once grand trees; one of the Yews is 16 feet in girth; the lofty Silver Fir form one of the landmarks of the Forest, and there are also some shapely specimens of Abies nobilis.

This concluded the work of the day, as the party had a long return-drive to accomplish, through Emery Down and Lyndhurst, back to their headquarters at Southampton.

(To be continued.)

SHROPSHIRE HORTICULTURAL.

AUGUST 23, 24.—Cut Flower Section.—The cut-flower classes formed a very attractive and important feature at the above, and of which a report of the principal plant, fruit, and vegetable classes was given in our last issue.

Roses.—Messrs. Jas. Cocker & Sons, Aberdeen, were 1st for a collection of Roses, staging a good all-round lot of blooms for the season; Messrs. Croll, Dundee, were 2nd. Only two lots were shown in this class. The same firms occupied the like position in the class for twenty-four single blooms.

Dahlias made a grand show in themselves, especially in the classes confined to nurserymen. Prizes were offered for collections of all sections of the Dahlia to cover a space of 15 feet by 6 feet, and several good lots were staged. Messrs. Keynes, Williams & Co., were well ahead, both in quality of blooms staged and the artistic style in which they were set up. In the back-ground were five pyramids, with the blooms stuck thinly into moss with intervening upright pieces of cork, in two or three heights, draped with Ampelopsis, and having a few blooms of the single Dahlias stuck therein, with stands of show, fancy, Cactus, &c., in the front, edged with cork. The Society's Silver Medal was awarded to the 1st prize collection. Mr. George Humphries Chippenham (who was 2nd in the preceding class), was 1st for twenty-four Dahlias in variety; Messrs. Harkness, Bedale, being 2nd.

Gladiolus.—Several good collections in variety were staged, each collection covering a length of staging 24 feet by 6 feet.

Messrs. Harkness & Sons were a good 1st, their spikes of blooms being very fine indeed; Messrs. Jones and Sons, Shrewsbury, were 2nd. Messrs. Harkness were also to the front for eighteen spikes. Collections of Hardy Border Flowers made a grand display.

Messrs. Cocker & Sons were a good 1st, staging grand exhibits, the flowers being fresh and well-developed, and the colours and sizes well arranged, Liliun longifolium, L. giganteum, Achillea ptarmica plena, and the heath-like flowers of Veronica longifolia rosea showed to advantage. Messrs. Harkness & Sons, Laxton Brothers, Bedford, Dicksons of Chester, Biddle & Co., Loughborough, following in that order, a couple of extra prizes having been awarded.

Carnations.—Collections of Carnations were shown under the same conditions as indicated in preceding classes, by Mr. M. Campbell, High Blantyre, N.B., Messrs. Laing & Mather, Kelso, and Mr. John Forbes, Hawick, N.B., who took the prizes in that order.

Bouquets.—Prizes (and Silver Medal) were

offered for ball and bridal bouquets, one of each. 1st, Messrs. Jenkinson & Son, Newcastle Staffordshire. The exhibits were shown in vases about 2 feet high, with fine spikes of Odontoglossum crispum hanging over down to the staging, the composition of the arrangements consisting of Phalenopsis amabilis grandiflora, Epidendrum fragrans, &c. Messrs. Perkins (Coventry) were a capital 2nd.

In the class for a special floral display, some grand arrangements were made, long spikes of Odontoglossum crispum being freely employed, and with excellent effect. In this class a Gold Medal went with the 1st prize.

Messrs. Perkins' 1st prize arrangement (collection of a series of floral devices, it might be called) was a most artistic piece of floral workmanship; Messrs. Jenkinson & Son were 2nd, and Messrs. Jones & Sons, and Messrs. Phelps & Co., Cardiff, were placed equal 3rd in this fine class.

The exhibitors in most of the above-mentioned classes were also successful in several other classes of less importance.

GARDENING AND FORESTRY EXHIBITION.

Gladiolus and Dahlia Show.

AUGUST 23, 24.—The large marquee was well filled on this occasion with exhibits of unusual excellence. As at previous shows, the miscellaneous productions formed a large feature in the show.

Gladiolus.—In the large class for 100 spikes of Gladiolus, Messrs. J. Burrell & Co., Cambridge, were the only competitors, but their exhibit could hardly have been beaten for general excellence. The spikes were of extra vigour and length, and the varieties quite up to date, many of their own seedlings being very prominent. The best of the named kinds were Castilda, pale sulphur with maroon feathering; Tessa, bright salmon-pink; Muriel, dark red with white centre; and Fiametta, soft pink—a lovely shade. Other good ones were Baroness Burdett Coutts, Atlas, Iolanthe, Conquerant, and Pasteru.

Mr. D. Whitlan, Brechin, Scotland, was first for twelve spikes in the amateurs' class, the finest being Pyramid, Soleil Couchant, and Enchantress, the whole being a capital exhibit.

Dahlias.—For twenty-four show and fancy Dahlias, Mr. Mortimer, nurseryman, Rowledge, Farnham, was placed 1st; his finest flowers were Mrs. Saunders, John Walker, Muriel, Major Bartlett, Buttercup, David Saunders, Nugget, and Maud Fellowes; Mr. Chas. Turner, Slough, was a very close 2nd, his best blooms being Colonist, J. Bennett, Mrs. Slack, Prince Bismarck, and Primrose Dame. These two exhibits were remarkably even and close.

Mr. Vagg, gr. to J. T. Theobald, Esq., M.P., Bedford, Havering, Essex, was 1st for twelve varieties in the amateurs' class with compact blooms, the best being Prince of Denmark, James Cocker, and Rev. J. B. McCamm; Mr. Ocock, gr. to Mrs. McIntosh, Havering Park, Romford, being an excellent 2nd, a fine bloom of Harry Keith being of deep colour.

The best lot of Cactus and decorative varieties (nine varieties) in a strong class, was that shown by Messrs. J. Cheal & Son, Crawley; these were of first-class quality, the finest being Countess of Gosford, Kaiserin, Bertha Mawley, and Duke of Clarence, all new kinds. Mr. W. Seale, Vine Nursery, Sevenoaks, was a good 2nd; the finest here were Kaiserin and St. Catherine.

Mr. Seale was 1st with an excellent exhibit of Pompons, in twelve varieties, the flowers of medium size but of capital quality; the finest of these were Hilda, Whiper, Leda, Red Indian, Lillian, and Eva. Mr. Charles Turner was 2nd, but almost equal to the winner; the finest here were Fairy Tale, Eric, Irene, Ariel, Darkness, and Rowena; also a rich orange, paler at base of petals. This forms a dozen of the best Pompon or garden Dahlias.

Messrs. J. Cheal & Son were 1st for twenty-four single kinds, with a superior exhibit, the best being Aurora (new, orange-scarlet and buff), The Bride, Eclipse, W. C. Harvey, Miss Linnaker, and Lowfield Beauty; Mr. Seale was 2nd.

Asters were poor, and need no further comment, the season being against them.

Fruits.—In the class for hardy fruits, Mr. McIndoe, gr. to Sir J. Pease, Bart., Hutton Hall, Yorks, was 1st, with very fine produce, the dishes of Souvenir du Congrès and Pitmaston Duchess Pears being extra good; Cox's Pomona Apples, Elruge Nectarines, good Peaches, Apricots, and Plums, all of

the best quality. Mr. Wythes, gr. to the Duke of Northumberland, Syon House, was an excellent 2nd, the finest dishes being those of Morello Cherries, Peaches, Nectarines, Pears and Apples, with good Plums. (This latter exhibit was strictly within the wording of the schedule, as intended by the committee, outdoor fruits being intended, whereas in the 1st prize lot were some probably from orchard-house trees, the Pears in particular).

Miscellaneous exhibits came from various sources. Messrs. W. Paul & Son, Waltham Cross, were awarded the Gold Medal for a fine group of fruit trees in pots bearing well, also of dishes of Apples, &c., in good variety, and a fine lot of autumnal Roses. Messrs. Kelway & Son, Langport, staged a large assortment of Gladioli, in excellent style and variety of colour; also of Gaillardias, Asters, Canoas, and hardy herbaceous flowers. Mr. Wythes had well-grown healthy plants of Nepenthes, including N. Mastersiana x, N. Dicksoniana x, N. Curtian, and other rare kinds; good Crotons, well coloured, were included. Mr. Hudson, Gunnersbury House, showed fine specimens of scented-leaved Pelargoniums.

A large collection of Melons came from Mr. T. J. Stacey, Caversham, Reading; of Apples and Pears from Messrs. Spooner & Sons, Hounslow; and Peaches and Nectarines from Mr. Rickwood, gr. to Lady Freake, Twickenham; whilst Messrs. Barr & Son had a large assortment of hardy flowers; and Mr. Salmon, West Norwood (an amateur grower), an excellent exhibit of garden flowers. Several other smaller exhibits were staged.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—

- 0, Scotland. N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending August 26, is furnished from the Meteorological Office:—

"The weather during the earlier part of this period was very unsettled in the western and northern parts of the kingdom, and rain fell daily; in the more

southern and eastern districts the conditions were generally fair and dry, although slight rain was experienced during the earlier part of the time.

"The temperature continued to decrease, and was much lower than that of the preceding week, but was still above the mean, the excess ranging from 1° in Ireland and the east of Scotland, to 3° in 'England, N.E.' and the Channel Islands. The highest of the maxima were recorded on the 20th, when they ranged from 79° in 'England, E.' and 78° in 'England, S.', to 69° in 'Scotland, N.' and 'Ireland, S., and to 68° in 'Scotland, W.' The lowest of the maxima were registered during the middle part of the week in Scotland, but at the end of the week in most parts of England and Ireland; they were much lower than any recorded of late, ranging from 40° to 41° in Ireland, from 42° to 49° in Scotland, and from 41° to 49° in England. In the Channel Islands, however, the thermometer did not fall below 56°.

"The rainfall exceeded the mean in Ireland and Scotland, and just equalled it in 'England, N.W.,' in all other districts the fall was slightly less than the normal.

"The bright sunshine again exceeded the mean, the percentage of the possible duration ranging from 61 in 'England, S.W.' 57 in the 'Midland Counties,' and 56 in the 'Channel Islands,' to 41 in 'Scotland, E.,' and to 28 in 'Scotland, N.'"

ENQUIRIES.

"He that questioneth much shall learn much."—Bacon.

CONFIRER QUERIES—What was the tree called the 'China Fir' in Miller's Dictionary, ed. 8?

"GARDENERS' CHRONICLE," June 23, 1883.—Can some reader oblige a fellow-reader with a copy of the 'Gardeners' Chronicle' for the above date, and which is now out of print? Address the Editor.

ERGOT OF WHEAT, BARLEY, OR RYE.—Mr. F. W. Burbidge, 91, Haddington Road, Dublin, would be grateful for fresh specimens of ergot for botanical and museum purposes, as growing on the inflorescence of any species of Grass or corn.

MARKETS.

COVENT GARDEN, August 31.

LARGE quantities of Apples and Plums have reached our Market during the week; many of the former being drops, and the latter coming very ripe after the scorching heat of the previous fortnight. Prices for which, although very low, have been made with difficulty. James Webber, Wholesale Apple Market.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns for flower types (Arum, Asten, Aster, Bouvardia, etc.) and prices in s. d. s. d. format.

ORCHID-BLOOM in variety.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns for plant types (Adiantum, Aspidistra, Asters, Balsams, Campanula, etc.) and prices in s. d. s. d. format.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with columns for fruit types (Apples, Cobs, Grapes, Lemons, Oranges) and prices in s. d. s. d. format.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with columns for vegetable types (Beans, Beet, Carrots, Cauliflowers, Cucumbers, Endive, Herbs, Lettuces) and prices in s. d. s. d. format.

POTATOES.

Arrivals are still very heavy and demand limited, except for finest samples, which realise 4s. 6d. to 5s. Ordinary samples hard to clear, except at very low prices. J. B. Thomas.

SEEDS.

LONDON: August 30.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report an improving demand for seeds required for present sowing. Trifolium, both English and foreign, is getting into comparatively narrow compass; fine samples are now obtainable at tempting rates. Winter Tares are hard to buy, and hard to sell; the inquiry for them is for the moment small. Low prices prevail for the new Essex Giant Seed Rye. As regards Mustard seed, the tendency continued downwards. Rapeseed keeps exceedingly reasonable. The market for Canary-seed is steadier. There is no change in Hemp-seed. Blue Peas go cheaper. Choice Haricot Beans are now obtainable for very little money. Linseed is unaltered.

FRUITS AND VEGETABLES.

BOROUGH: August 29.—Quotations:—Cabbages, 5s. to 8s. per tally; Parsley, 1s. 6d.; Carrots, 3s. to 4s.; Turnips, 4s. to 5s. per dozen bunches; Onions, 5s. to 5s. 6d. per cwt.; Plums, 1s. 6d. to 2s. 6d. per half-sieve; Apples, 6s.; Pears, 2s. 6d. to 5s. per bushel.

ITALYFIELDS: August 29.—Quotations:—Cabbages, 5s. to 5s. per tally; Turnips, 4s. to 5s.; Carrots, 3s. to 4s. per dozen bunches; Onions, 5s. to 5s. 6d. per cwt.; Apples, 2s. 6d. to 6s.; Pears, 2s. 6d. to 3s. per bushel; Plums, 1s. 6d. to 3s. 6d.; Damsons, 1s. to 1s. 9d. per half-sieve.

STRATFORD: Aug. 29.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned quotations:—Cabbages, 4s. to 6s. per tally; Collards, 3s. to 5s. do.; Cauliflowers, 1s. to 1s. 6d. per dozen; do., 4s. to 7s. 6d. per tally; Turnips, 3s. to 4s. per dozen bunches; Carrots, household, 50s. to 80s. per ton; Mangels, 32s. to 34s. do.; Onions, Dutch, 4s. 6d. to 5s. per bag; do., Port, 7s. to 8s. per case; Apples, English, 1s. 6d. to 4s. per bushel; Pears, English, 2s. 6d. to 5s. do.; Plums, 2s. 6d. to 4s. do.; do., 1s. 9d. to 2s. 3d. per half-sieve; Tomatos, English, 3d. to 4d. per lb.; Grapes, 6d. to 8s. per lb.

FARRINGTON: August 30.—Quotations:—Cabbages, 5s. to 8s. per tally; Carrots, 3s. to 4s.; Parsleys, 6d.; Turnips, 4s. to 5s., per dozen bunches; Onions, 5s. to 5s. 6d. per cwt.; Beans, 2s. 3d. to 2s. 6d. per half sieve; Marrows, 1s. 6d. per dozen.

FARRINGTON: Aug. 31.—Quotations:—Apples, 3s. per bushel; Pears, Hazel, 4s. do.; Williams, 6s. do.; Tomatos, 4d. per pound; Melons, 5s. 6d. per case; Walnuts, 4s. per pot; Grapes, Lisbon, 11s. per box.

ACACIAS: F. & Co. How could you mistake the Acacias of Australia and the Riviera for the Robinias or false Acacias of the U.S.? Clethra tomentosa is C. alnifolia.

EXHIBITING BEANS: M. H. It is not usual to pit kidney or French Beans against Runner Beans. These are shown in separate classes.

EXHIBITING FRUIT: A., Devon. If the schedule says nine varieties, but not more than two distinct varieties of any one kind of fruit, it would be allowable to show two dishes of Peaches or two of anything else, provided these were different varieties. We should suppose that the exhibitor who showed nine kinds of fruits would, other points being equal, beat the exhibitor who showed fewer kinds.

FUNGI ON MUSHROOM BED: F. B. The specimens are fragile, and so broken up in transmission, that they cannot be identified. Seem to be a species of Hlypholoma, not edible, but probably not poisonous. Not developed from the Mushroom spawn, but independent. Other species sometimes take possession of Mushroom beds, because the conditions are favourable. The information given is so meagre that we cannot advise what to do.

If only a few clusters appear, they are better removed at once; but, if the whole bed is appropriated by the strangers, then the bed will have to be sacrificed, and entirely cleared away, or they will establish themselves permanently. M. C. C.

LAPAGENIA: Faversham. A matter of taste. Some people would admire it, and for variety's sake, it is certainly worth propagating.

MELON ROOTS: A. D. A bad case of eel-worms, so often described and figured. There is no cure, but burn all the plants, turn out the soil, and start afresh.

MUSHROOMS: J. H. The specimen had decayed quite beyond recognition. Anything of this nature should be packed when quite dry, and it is always best to send them in the middle of the week. These had been delayed owing to Sunday intervening.

NAMES OF FRUITS: J. E. 1, Not recognised; 2, Calville St. Sauvour; 3, Lord Derby; 4, Pear Williams' Bon Chrétien; 5, Decayed.—R. M. W. 1, Hawthornden; 2, Scarlet Nonpareil; 3, Claygate Pearmain; 4, Cellini; 5, Cat's-head; 6, Golden Noble.—Webb & Brand, 1, Alfriston; 2, Gloria Mundi.—W. P. 2, Peach Barrington; 1, Was crushed, but probably same as No. 2; Pear Monsallard.—W. A. 1, Lord Derby; 2, Hawthornden; 3, New Hawthornden; 4 and 5, Kerry Pippin; 6, Braddick's Nonpareil. [A number are unavoidably held over until next week. ED.]

NAMES OF PLANTS: H. S. Miltonia Clowesii.—J. D. Saccobolium Blumei, now placed under Rhyncosytis.—W. A. C. Conoclinium ianthium.—T. M. 1, Chimonanthus fragrans; 2, Berberis vulgaris; 3, Peraxilla Plumbago rosea, specimen insufficient.—Maxwell. Cotoneaster frigida.—J. S. Apparently Basella sp.—G. H. S. 1, Picea excelsa Clanbrasiliana; 2, Aralia japonica; 3, Ginkgo biloba; 4, Cupressus thuyoides; 5, Picea excelsa; 6, Cephalotaxus drupacea; 7, Cupressus Lawsoniana; 8, Bocconia cordata.—D. R. Berteroa incana, an introduced weed.

RESTING OF CYMBIDIUM GIGANTEUM: J. R. Cymbidiums do best in the Cattleya-house, and as C. giganteum blooms in the winter, it should not be removed to a cooler house at that period. The resting of the plant may be attained by placing it in a cool part of the house, and affording only a moderate quantity of moisture at the roots.

SUBSTANCE IN POND: Correspondent. The specimen is a fresh-water Bryozoon, and is commonly known in England under the name of Alcyonella fungosa, Pallas; but more recent authorities regard this species as a mere variation in mode of growth of Plumatella repens, Linnaeus. The best figures and descriptions are in Allman's Monograph of Fresh-water Polyzoa (Ray Society), 1856, p. 93, pl. V.; and Van Benedin, Mem. Acad. Roy. Belg., 1848, vol. xxi., p. 18. [This reply has been delayed, owing to the absence of the referee. ED.]

TIME OF FLOWERING OF CYRTOPODIUM PONCTATUM: J. R. The flowers appear with the young growth in the spring. The plant requires much heat generally, but no harm will ensue if it be placed in a cooler house when the inflorescence is out.

VINES: E. B. The canes may be planted as soon as the foliage begins to turn of a yellow colour. Spread out the roots at various levels, between 4 and 8 inches from the surface. Water after planting, and afford a light mulch, a heavier one being put on at the beginning of winter. Remove the unripe tips of canes in December, and disbud after growth has begun. The canes may carry 8 to 10 lb. of fruit.

VINE DISEASE: B. R. J. Undoubtedly another case of browning (Plasmiodiophora vitis), although the decay of the Grapes may possibly be not directly due to this, as they are filled with the mycelium and fruit of Cladosporium viticolum. These, along with the insects, make the plants in a deplorable condition. G. Massee.

Prices from £25, including Pump and Timber Supports.

May 27, 1893, The Dell, Englefield Green, Surrey.
ROBERT WARNER & CO. Engineers, 27, Jewin Crescent, E.C.
Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schroder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,
H. BALLANTINE, Head Gardener to Baron Schroder.

We have a similar Mill and set of Pumps in hand for Lord Northbourne.

NUMEROUS OTHER TESTIMONIALS ON APPLICATION TO
27, JEWIN CRESCENT, CRIPPLEGATE, LONDON, E.C.
Engineering Works, WALTON-ON-THE-NAZE, ESSEX.

FIELD'S WALL-NAIL

(PATENTED).

NO CLOTH NEEDED.

These are now made with longer shanks, for insertion into mortar-joints. They are much neater than cloth shreds. Trailing done in half usual time, and carried on without stoppages. Made in four sizes.

Price 4/6, per lb. Wholesale price on application.

Nail-Bags specially designed for these Nails.

S. G. FIELD, 54, Wilson Street, Finsbury, E.C.

These Nails can also be obtained of Mr. PARTON, Queen Street, Chesham, E.C.; Messrs. BARK AND SON, King Street, Covent Garden, W.C.; Mr. T. RILEY, Ironmonger, Fleetwood; Mr. F. PLACE, Seedsman, Hitley, near Crew.

FIXED.

THE IMPROVED GARDEN GULLY

(VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8-in., 2s.; 10-in., 3s.; 12-in., 6s. 6d.

(The larger sizes are very strong for carriage drives.)

Full Particulars and Testimonials on application.

FLORIST.—Thoroughly understands the Making-up of all Floral Designs for Funerals, also Bouquets and Button-holes.—W. WINSTANLEY, Florist, 43, Market Hall, Southampton.

WE ARE NEVER TOO OLD TO LEARN, is a sentence fruitful of practical sense, and the truth of it is demonstrated every day. It is only a fool who will say it is impossible to learn, and his words convict him of dense ignorance. The most eminent men are always anxious to improve themselves. When past fifty years of age (ably, the celebrated translator of Homer and Virgil, commenced to learn Latin and Greek. Socrates evidenced his declining years by learning to play various musical instruments. Many instances come to hand also of men living to the age of seventy without knowing the value of Holloway's Pills and Ointment. At last they learn their value, and have gained fresh vigour and renewed health.

"GARDENERS' CHRONICLE."

Continued Increase in the Circulation.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper,

Increased to the extent of 75 per Cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

H. CANNELL AND SONS wish to inform all friends and customers that their ROMAN HYACINTHS and other BULBS have arrived in the finest condition and size. Our large quantity, and experience in importing direct from the most energetic growers, offer great advantages, and we should feel a real pleasure in receiving orders, knowing, as we do, they will be sure to give more than satisfaction throughout the season. Send for a Catalogue, Swanley, Kent.

SUTTONS' EARLY HYACINTHS and NARCISSI. For flowering at Christmas.

SUTTONS' EARLY ROMAN HYACINTHS. Single White, from 1s. 9d. per dozen. Single Blue, 1s. 6d. per dozen.

The consignment comprises 239 Cases, and they will be offered one case in a lot, as received, the contents varying from 50 to 500 in each case, according to size. The quantities are as follows:—

- 1,070 extra large, 11 to 15 inches and upwards. 7,160 nine to eleven inches. 30,720 seven to nine inches. 10,000 five to seven inches.

MESSRS. PROTHEROE AND MORRIS will SELL the above extensive consignment in their BULB SALE, at the Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on THURSDAY NEXT, September 14 (being the Thursday in the Great Trade Sale Week). The Sale commences at 12 o'clock, but the LILIUM HARRISI will be offered at 2 o'clock, and sold without the slightest reserve.

Croydon Lodge, Croydon.

About ten minutes' walk from West Croydon and Addiscombe, and twenty minutes from East Croydon Railway Stations.

Highly important THREE DAYS' UNRESERVED SALE of the valuable Collection of ESTABLISHED ORCHIDS, STOVE and GREENHOUSE PLANTS, and GARDEN EFFECTS, by order of the Executors of the late Stephenson Clarke, Esq.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, Croydon Lodge, Croydon, on TUESDAY, September 25, and TWO FOLLOWING DAYS, at half-past 12 o'clock punctually each day, absolutely without reserve, the whole of the extensive, valuable, and well-grown COLLECTION of ESTABLISHED ORCHIDS, comprising about 1500 plants, and including Cymbidium Mastersii, C. eburneum, C. Downianum, Phalenopsis Schilleriana, Cypripedium Elliottianum, C. Chamberlainianum, Cattleya Trianae bella, 3 plants of C. T. Clarkiana, five plants of C. Mossiae and C. Trianae, C. gigas, Maxillaria, Sanderiana, Peristeria elata, Sobralia macrantha, S. xantholeuca, Lycaste Skinneri alba, Odontoglossum Alexandrie in variety, O. hebraticum, Dendrobium, Calanthes, Vandas, Arides, Masdevallias, and others. An unusually fine collection of

STOVE AND GREENHOUSE PLANTS.

Many of them choice specimens, which have been successfully exhibited at various shows, including Anthurium Scherzerianum, A. Andreanum, A. magnificum, Cycas revoluta, Alocasia, 9 Eucharis amazonica, 9 Pancratium fragrans, a grand plant of Lantana borbonica (13 feet through), Scaevola elegans, Kentias, Clerodendrons, Lapageria alba, Rondeletia speciosa major, Allamandas, a good batch of well-cultured Dracaenas and Crotons, well-grown plants of Calladiums, Dipladenias, Pandanus, and Gardenias.

FERNS IN VARIETY.

Amongst them being Adiantum conense, A. Mooreanum, A. trapeziforme, Dicksonia auctoretica, Microlepia hirta cristata, Nephrolepis Davaloides furcans, Sclaginellas in tons, and numerous others. Fuchsias and Agapanthus umbellatus.

EIGHT SPLENDID SPECIMEN AZALEAS.

And 70 smaller plants, large Camellias, a superb strain of Double and Single Begonias, Amaryllis, Tea Roses, Azalea mollis, Ghent Azaleas, Hardy Ferns, and large numbers of other plants. Also

15 FRAMES, various sizes, and a Quantity of FLOWER-POTS.

At the HEATH NURSERY, HOUNSLOW, by order of Messrs. C. Lee & Son (1 day).

Other Sales are being arranged, and the dates will be notified in future announcements.

The Auctioneers desire to call the special attention of those who may be planting during the season to these important Sales. They are now revising their Permanent Lists, and will be pleased to add the names of intending purchasers who may wish to have Catalogues forwarded of the above, or any particular auction.

Auction Rooms and Estate Offices, 67 and 68, Cheapside, London, E.C.

Friday next.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, Sept. 15, by order of F. Sander & Co., St. Albans, ESTABLISHED and IMPORTED ORCHIDS, among which will be found the following:—

CATTELEYA AUREA AND VARS..

Established but unflowered Plants. This is the section of C. aurea that has been so productive of the many gorgeous forms of Cattleya Hardyana and kindred varieties, which have appeared in various collections. Among them may be enumerated the white-sepalled and petalled C. Hardyana, C. aurea marmorata, C. Oweniana, C. Hardyana var. Massiana, the grand form known as Statters Variety, the splendid variety in the renowned Measureura collection and many others of equal beauty and merit, to which must be added the latest arrival in Mr. W. C. Clark's possession. Mr. Clark writes us under date of August 29, 1893: "I sent to Mr. O'Brien a spike (three flowers) of one of the finest C. Hardyana I ever saw. It flowered from a lot sent me by you as C. aurea. It may be at the Royal Horticultural Society's Show. You should see it; the petals and sepals are very dark, and the lip superb."

CYPRIPEDIUM MACROCHILUM.

C. longifolium. Royal Hort. Londonii, First-class certificate, Royal Hort. cultural Society, August 11, 1891. The Gardeners' Chronicle says: "It is one of the most extraordinary productions of the hybridist skill."

ONCIDIUM VARICOSUM ROGERSII.

The gigantic, brilliant, Buttercup-coloured form, the grandiflora type of this superb Oncidium. Flowers are 3 1/2 inches across in many cases, and are suspended in the air like huge butterflies with expanded wings; frequently 200 and upwards of lovely Buttercup-yellow flowers are carried on a single inflorescence. The flower-spikes are much branched, and in bloom present a mass of glowing colour quite unequalled by any other Oncid. The true Rogersii form exists only in solitary places, and has not been imported for many years, owing to the difficulty of finding it in its native home, where it seems to have been nearly extirpated.

It is the most brilliant and attractive of all Oncids.

CYPRIPEDIUM SANDERIANUM.

The most remarkable and long-st-petalled of all the known species of Cypripedes. Its ribbon-like petals frequently attain a length of 2 to 3 feet, and are richly coloured with purple and yellow, the lower part being spotted and barred; as many as five and six blossoms are borne on one stem, and several are expanded at the same time. It is the most distinct and remarkable of all the Eastern Cypripedes, and is well worthy a place in the most select collections.

DENDROBIUM LOWII.

This very beautiful Dendrobium is now extremely rare, and very few are at present in cultivation. The flowers, which are borne in clusters of five or six, are bright buff-yellow, 2 to 3 inches across, the lip being stained with crimson at the apex, and traversed by lines of long red hairs springing from a crimson base.

DENDROBIUM MIRBELIANUM.

Extremely rare, very quaint and beautiful, carrying thyrses of delicate creamy-yellow flowers.

EULOPHIELLA ELISARETHE.

The new and beautiful Orchid from Madagascar, discovered by M. Hamelin.

Flowers white, with the outer surface purplish-red, callus of the lip orange-yellow; in shape they resemble Phalenopsis blooms, and as many as fifty flowers were seen on a single inflorescence on plants in a wild state by M. Hamelin.

The plants are in grand order, and are breaking freely.

HABENARIA GIGANTEA VAR. SUMATRANA.

syn. H. Susanua var. Sumatrana. Flowers white, very large, somewhat resembling in its heavily-fringed libellum, Brasavola Digbyana, but having larger blossoms than the latter. The flowers are borne on upright stems, after the manner of Disa grandiflora.

CYPRIPEDIUM NICHOLSONIANUM.

(Provisionally named.) A distinct Cypripedium from the Island of Palawan.

EPIDENDRUM FORGETIANUM. (New)

The habit and form of the pseudobulbs are similar to those of E. villosum, E. vitellinum, and others; but the colour of the flowers is different. The sepals are spatulate, concave near the lip, and of a dusky yellow, netted with deep brown; the petals are roundish and clawed. The three-lobed lip has a creamy ridged middle lobe, and the lateral ones are rosy, with deeper lines, and folded over the purple column.

Awarded Botanical Certificate, June 21, 1893.

ONCIDIUM SANDERIANUM.

(Provisionally named.) A new and superb Oncidium from Venezuela.

Flowers rosy red, borne in hundreds on dwarfish many-branched spikes, forming a perfect bouquet when in bloom.

ODONTOGLOSSUM LONDSBOROUGHIANUM.

CYPRIPEDIUM GODEFROYE LEUCOCHEILUM.

Table with 2 columns listing plant names and their characteristics.

On view morning of Sale, and Catalogues had.

Bickley.

Ten minutes' walk from the Bickley Railway Station.

CLEARANCE SALE OF STOVE and GREENHOUSE PLANTS, ORCHIDS, GLASS ERECTIONS, PIPING, surplus FURNITURE and EFFECTS, by order of F. A. Philbrick, Esq., Q.C., whose lease of the property has expired.

MESSRS. PROTHEROE AND MORRIS will SELL by AUCTION, on the Premises, "Oldfield," Oldfield Road, Bickley, Kent, on THURSDAY, September 21, at 1 o'clock, the remaining STOVE and GREENHOUSE PLANTS, consisting of Palms, Fuchsias, Geraniums, Camellias, Azaleas, Callas, 150 Ferns in variety, Anthuriums, choice Tea Roses in pots, and a few Orchids; the erections of 6 Greenhouses, 2 Sheds, 1300 feet 4-inch Piping, Boilers, Brickwork, and Sundry. Also the remaining HOUSEHOLD FURNITURE, comprising Bed-room appointments, Book-cases, Couches, oak Chairs, Axminster Carpets, and other effects.

May be viewed day prior and morning of Sale. Catalogues had on the Premises; of Messrs. HANCOCK, MARRABLE AND TERRELL, Solicitors, 8A, New Inn, W.C.; and of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Every Day.

EXHIBITION.

BRISTOL CHRYSANTHEMUM SOCIETY. SPECIAL PRIZES and CLASSES for AMATEURS. The next ANNUAL SHOW will be held in the COLSTON HALL, on WEDNESDAY and THURSDAY, November 15 and 16 next. Schedules are now ready, and may be had free of EDWIN G. COOPER, Secretary, 2, Mervyn Road, Bishopston, Bristol.

Borough of West Ham.—To Nurserymen, &c. THE COUNCIL hereby invite TENDERS for the supply and delivery of about 900 TREES, 11,000 SHRUBS, and 600 CREEPERS.

Further particulars may be obtained at the Office of Mr. Lewis Angell, Borough Engineer, Town Hall, Stratford, E. Tenders endorsed "Tender for Trees, &c.," to be sent to my Office not later than Saturday, September 16th, 1893.

The Council do not bind themselves to accept the lowest or any Tender. The Contractor will be required to enter into a bond, with one surety, for the due performance of the Contract, and no work will be ordered under the Contract until such bond has been duly executed.

The Contractor whose Tender is accepted, and with whom a Contract is entered into, will be required to pay to the whole of his workmen such rate of wages, and observe such hours of labour, as are recognised by the Workmen's Trades Unions and in force at the time of signing the Contract. In the event of any breach of such agreement the Council will enforce the penalty clause in its entirety.

By order of the Council, FRED. E. HILLEARY, Town Clerk. Town Hall, West Ham, E. 29th August, 1893.

MELTON MOWBRAY LOCAL BOARD PLANTING OF CEMETERY.

The above Local Board INVITE TENDERS for PLANTING the CEMETERY, situate on the Thorpe Road, Melton Mowbray, according to Plans and Specifications, which may be seen at my Office.

Sealed Tenders endorsed "Cemetery," must reach me not later than 12 o'Clock noon, on Tuesday, September 19, 1893. The Board do not bind themselves to accept the lowest or any Tender. By Order, RICHARD BARKER, Clerk.

Local Board Offices, 5, Sherard Street, Melton Mowbray, August 31, 1893.

ORCHIDS.—Many rare and choice Cattleyas, Cypripediums, Dendrobiums, Odontoglossums, &c., always in stock. Inspection invited. Please write for LIST. W. L. LEWIS AND CO., F.R.H.S., Chase Side, Southgate, London, N.

THE
Gardeners' Chronicle.

SATURDAY, SEPTEMBER 9, 1893.

CARDIFF CASTLE.

EXCEPT by those who have visited the town during the last few years, Cardiff is thought to be a small place, black and repulsive, through the presence of mines and ironworks immediately surrounding it. It is, therefore necessary briefly to state that Cardiff has so extended itself during the last quarter of a century that her population is now about 130,000, and that in cleanliness, brightness and in her health-statistics, the Welsh metropolis may claim as high distinction as almost any town of equal size, and certainly of any port doing a trade such as is done here.

The collieries are at some distance from Cardiff, and although an immense quantity of coal is shipped from her docks, none of this is from parts within a mile or two of Cardiff.

The famous Castle, therefore, though it adjoins two of the main streets, is not in such a disagreeable position as would be supposed had the above explanation been omitted. Then, again, although the Castle itself is so near the main thoroughfare, the grounds extend right away to Llandaff; and then, on the north-west side of it, is a walk of about 2 miles through private ground, and an open, pretty country. The antiquity of the place itself as a castle is great, for there are many authorities for stating that it was a stronghold of the British princes long before the Norman Conquest, and in the eleventh and twelfth centuries it was the residence of the Lords of Glamorgan, and of Robert Fitzhamon. It passed into the Marquis of Bute's family through a marriage with an heiress of the Windsors, who inherited it from the second Earl of Pembroke, to whom it was granted by Henry VII. after the Battle of Bosworth Field. Cromwell succeeded in partially destroying it, and the old keep (see fig. 52, p. 305), which stands on a lofty artificial mound, is still in ruin, exceedingly picturesque, clad more or less with Ivy, and save what has been necessary in order to preserve it at all, nothing has been done thereto since.

From the top is obtained a lovely view in each direction; on the one side of the town of Cardiff itself, down to the docks, and across the Channel, and on the other an extensive view of the country district, commencing with the scenery along the banks of the Taff through Llandaff, where one of the most ancient of our cathedrals may be seen, and across between the Caerphilly Hills and Castle Coch.

Neither is the Castle itself fully renovated, although a vast amount of money has been expended in that direction by the present Marquis. It is difficult to tell exactly of what age the different parts are, for no doubt there have been partial restorations at many different times; and the whole of the work that has been done by

the present Marquis is on a grand scale, and the aim has been to reproduce all the characteristics of a feudal fortress.

Our illustration (fig. 50, p. 297) shows the gate-house on the right, from which entrance is gained from the street; and the Black Tower, which if not the identical one in which Robert, Duke of Normandy, was incarcerated for twenty-six years, is at least on the same site. From this point westward stretches a high wall, which has been repaired, and the path along the top which forms a corridor is covered in, whilst the apertures between the battlements are furnished with shutters. This wall (fig. 50), which has a south aspect, is covered with Vines, as will be seen from the figure. They are about 40 feet high, and in favourable seasons yield a good crop of Grapes, which are used, together with those from the vineyards—of which more anon—to make the wines for which the Cardiff district is fast becoming famous. The crop on this wall during the present season will be something more than half a ton, and many of the bunches will weigh 2 lb. These are unique, for at no other place in Britain can a similar Vine-covered wall be seen.

At the extreme left of the illustration, and at the south-west angle of the enclosure, rises a clock-tower, with pointed roof, 140 feet high. It is quite new, and contains a number of apartments on its seven floors.

The residential portion of the Castle (fig. 52) runs north from this tower. It is a handsome building, with early English turrets; but we must refrain from speaking of the Castle further, except to say that, in the joiner's shop attached thereto, is a model in wood of the Castle as it is to be when the scheme for its restoration has been fully accomplished; and if ever this is done, it will form one of the most remarkable buildings in the country, but it will require a prodigious expenditure of money.

THE PLEASURE GROUNDS

extend from the north-west side of the Castle, in the direction of the village of Llandaff, and the greater part has been laid out by the present gardener upon ground that in former days was known as "Cooper's Fields." From the Castle they are reached by several ways, one of these by means of a pretty Japanese-bridge across a large moat on this side of the Castle, being especially picturesque; whilst from the west front of the Castle, a wide drive runs through the whole length. Mr. Andrew Pettigrew, who has had charge of the gardens for the last twenty years, has a considerable reputation for landscape-work, and many gardens in South Wales have been laid out from his plans, as well as those attached to the Castle. Proceeding from the Castle we pass over a large expanse of well-kept lawn, which, even during the present season, has suffered but little, probably because the grounds, which are rather narrow, are bounded on the one side by the river Taff, and on the other by "the feeder." The feeder is a large body of water, diverted from the river about one mile and a half from the Castle by means of a weir, and passes by means of a canal to the docks at the other end of the town, a distance of about three miles. Near the Castle there is no flower-garden after the usual style; but here and there throughout the grounds, there are long herbaceous borders and isolated beds, often exceptionally large, and some filled with Pelargoniums. Four of these large beds are immediately under the Castle wall, three of them on the slope which intervenes between the Vine-wall, seen on fig. 50, and the public street. In the summer they are usually filled with tricolor Pelargoniums. On the west side, and immediately under a high old wall, along the top of which is a walk known as "The Lady's," are a number of small beds of different shape, also on a steep slope, and filled with the

usual summer bedding-plants. Plantations of Conifers, and choice shrubs, as they become older and larger, will add very considerably to the appearance of the grounds, by preventing too great a part being exposed to the view from any one point, although in this respect they are not greatly deficient even now. The area thus laid out is about 35 acres; and, at the end of this, is a wild, yet picturesque waste, which it is expected will also be reclaimed and kept in trim order.

The Marquis of Bute is an enthusiastic antiquarian, and a few years since a great amount of excavation was effected, with a view to find the foundations of an old monastery which it was thought stood but a short distance from the Castle on the south-west. This work proved quite successful, and the whole plan of the buildings is now to be seen, for the foundations have been repaired and built up about 3 feet above the ground. It is now intended to place a fountain in the largest room—the chapel; and the tops of the walls are so made as to hold a good quantity of soil, in which flowers will be planted, and the whole made to look as much in keeping with the grounds as is possible. Nor was the Marquis content upon finding and restoring so much, for, at the present time, he is searching for similar foundations in another part of the grounds, separated from these by a public road; and it appears that equal success will be achieved here.

THE FRUIT, FORCING AND PLANT HOUSES

are in good condition, and several of them are tolerably new, the work of Messrs. Boyd & Sons. The principal vinery is a good span-roofed house in two divisions, one of these being almost entirely devoted to Foster's Seedling, a Grape of which Mr. Pettigrew thinks highly, raising it from the position it holds in the opinion of most gardeners to that of the first-class, and as grown here it is undoubtedly superior to the variety as it is generally met with.

Black Alicante, Black Hamburgh, Alwick Seedling, Muscats, and Gros Colmar are also present, and invariably give a good crop. As in the pleasure-grounds and every other part of the garden, neatness is noticeable. The houses are kept scrupulously clean, and are well attended to in every particular. There is only one Peach-house, a lean-to, covered with large trees, which but seldom fail in carrying a heavy crop, though they are very susceptible to red-spider.

This together with an old Vinery are the only lean-to houses on the place; the others are all span-roofed. There are two stoves, one of which is always gay in the summer time, from the presence of an old Allamanda which run along the roof from one end to the other. It is filled with general stove subjects, including some well-grown Crotons, and two exceptionally large pots of Eucharis, which produce an abundance of bloom throughout the year. Two good and large Cycads, and some fine Dracenas are also noticeable. But few Orchids are grown, and these are chiefly Dendrobiums and Cypripediums; and some plants of Peristeria elata are very fine, producing stout, long spikes of bloom each year.

The other stove is about the same size, and contains another good lot of Crotons and Dracenas. A large house is devoted to the accommodation of Palms, which are extensively used in the furnishing of the Castle, and for church decoration. There are some good examples, but the continual moving to which they are subjected is greatly prejudicial, and most of the decorative plants here have to be grown with a view to using them for this purpose.

The greenhouses are kept gay with old-fashioned flowers, that are not met with so often as they might be, and in the spring a batch of Hydrangeas, struck in the previous autumn, always creates a remarkable display.

Pine-apples and Melons are grown well and largely, the former in a first-class range of pits, where some very heavy fruits are produced; Melons at the front of several of the warm houses, and in one long, low, span-roofed house, where Cucumbers and Tomatos do equally well. Those who have seen

the Melons grown at this place are not likely soon to forget them, for we have never seen Melons so large nor so abundant. One of the best varieties grown is one raised here and called Cardiff Castle, a now generally well-known and appreciated variety.

The culture Melons receive here differs materially from that generally practised, and principally in two particulars. They are watered up to and during the time the fruits are ripening, and sometimes the plants are started again for a succession crop. Cardiff Castle Cucumber is also worthy of mention here; it is not a large fruit, but a medium and pretty one, and a good cropper.

THE FRUIT AND VEGETABLE GARDEN

consists of about 6 acres, 2 of which surround the houses, and the other 4 have been made in a corner of the park, about a quarter of a mile distant. Whether in the smaller garden or the one in the park, and known as "the top" garden, the fruit trees are extraordinary; the walls are covered with fine healthy trees, principally Pears, trained with great care, and presenting perfect pictures of fertility.

In a town garden such as this, the results achieved are surprising, for it would be difficult to find a place where Pears grow and fruit better. Take, for instance, those splendid pyramidal trees, more especially those in the top garden, of Pitmaaston Duchess, which have reached a height of 30 feet, and which bear abundance of fine fruits each year. The crop this season is large, though the fruit is rather smaller than usual. Fruits of Pitmaaston Duchess and General Todtleben have weighed as much as 20 czs. each, and this without thinning, for we believe this is not generally practised. Any fruit-grower travelling this way should call and see the pyramidal and bush trees of Pears and Apples. Mr. Pettigrew prefers the bush form, and most of the Apples, as well as many of the Pear trees, are so trained. All were planted as maidens, and the foundation of the future trees laid by himself. But few, if any, of the newer varieties of Pears and Apples are unrepresented, but this year, among the Apples, two varieties that struck us most by the heavy crops they were carrying were Blenheim Orange and Cox's Orange Pippin. Lord Suffield is one of the best croppers in the garden as a rule, and is not so liable to canker as in most places; the fruits often weigh as much as one pound each. Beurrié Diel is a Pear that, in the top garden on large pyramidal trees, does not give such good returns as many of the others, but is good this year. In some seasons the fruits crack badly, apparently the effect of cold winds [Fungus, probably, Eo.] for on the walls Pears are far less subject to this disfigurement.

All the trees are well syringed with paraffin and soapy-water in the winter-time, and if any of them are covered with lichen, they are well scrubbed. Root-pruning is seldom necessary, indeed the gardener has only root-pruned one tree in eighteen years, and in this case alterations made its removal imperative before sufficient time had elapsed to show whether its effect would be beneficial or not. Close pruning is avoided, and a free growth encouraged. Plums do well on walls and on standards. It is a very remarkable circumstance, that not a Gooseberry bush exists in the whole garden. Currants, Raspberries, and Strawberries succeed well. The fruit-room, which for such a place should be a large, well-appointed room, is quite inadequate for the produce. The kitchen garden is arranged in suitable plots, and is well cropped with all the usual kinds of vegetables.

THE VINEYARDS.

The most interesting vineyard of the place at the present time are the vineyards—the one at Castle Coch, and the other at Swanbridge. The cultivation of the Vine in South Wales for the making of wine originated from an idea of the Marquis, which was the outcome of his study of ancient Wales. There is clear proof that in "times long ago" the monks made wine from Grapes grown in the district. The Marquis was anxious to revive the industry if possible, and with that object Mr. Pettigrew was sent to France to acquire a knowledge of

the methods of culture pursued in that country, with the result that those Vines now cultivated in vineyards near Cardiff are planted and attended to on French methods. Briefly stated, it is as follows. The Vines are all propagated from cuttings, which are struck in the Castle gardens, as they do very much better the first year sheltered thus, than in the open field. When transplanted to the vineyards at three years old, they are put out in rows about one yard and a half distant, and one yard between each plant. A stout stake is driven down near each plant, and left from 3 to 4 feet high. To this the plant is tied during the summer. Each year the canes are cut-back to two eyes, and so for a good number of years the fruit will be annually produced not far from the ground. On some of the older ones there are five, six, or more canes, allowed to go to the top of the stake, where they are stopped in July and tied, and this is all the attention they require, except the stopping of laterals. The variety chiefly grown is the French Gammy Noir, but two years ago some cuttings of an American variety were received from Florida.

subsequent one. However, the crop of this year is greatly superior even to that, the hot dry summer that was so prejudicial to most crops having produced the exact conditions required. Not a trace of red-spider could be seen, and the leaves are thick and the stems strong. Many of the Vines are carrying as many as fifteen good-sized bunches of fruit, and when these lines appear in print, they will be nearly ripe enough for cutting. As nearly as the crop can be estimated, it is thought that it will be something like 20 or 30 tons.

Mr. Pettigrew thinks that with a season like the present every few years, Vine-growing in South Wales would form a paying industry, for the crops this year will cover the rent of the land ever since they were planted, and the cost of all labour yet expended upon them. Of the quality and value of the wines made from these vineyards, some idea may be gained from the fact that a few months ago a quantity was sold at 115s. per dozen bottles. This wine was eleven years old. [Some that we had the opportunity of tasting through the kindness of Mr. Pettigrew, reminded us strongly of Barsac or Haut Sauterne. Ed.]

halves being strangely mottled with purple on a light greenish-yellow ground. The labellum is formed, as in *C. villosum* Boxalli (*C. Boxalli*, Rehb. f.), creamy-white, with the upper portion of the face rosy-purple. The lower sepals, which are longer than usual in the species, are very pale green, with four or five rows of purple blotches in lines from the base. It is a richly-coloured and bold-looking flower, which is much to the florist; but to the botanist it is of greater interest, as it is an unmistakable connecting link between *C. villosum* and *C. Boxalli*, distinctly proving the two to be one and the same species. It was imported by Messrs. F. Sander & Co., I am told, with plants of true *C. villosum*, and was selected to prove on account of a something in its appearance by which an expert may, as it were, instinctively select a new variety, although he may never be able to explain what influenced him in the selection. It is named in honour of R. H. Measures, Esq., The Woodlands, Streatham, one of the first and most constant lovers of the favourite genus *Cypripedium*. James O'Brien.

FIG. 50.—THE VINE CLAD WALL, CARDIFF CASTLE. (SEE P. 296.)

At present the latter are not bearing so freely as the others, but the bunches and berries are much larger, and they will be given more time to show their characteristics, as they may bear freely enough when a little older. At Castle Coch, which is 5 miles from Cardiff, there are 4 acres planted, and most of them have been out about seven years. The vineyard is situated on a steep slope facing south, and a dense wood behind completely shelters it from the north. The soil is a red loam, and stones are very abundant in it. Swanbridge is about 7 miles from Cardiff, and lies close to the sea-beach. The slope is not nearly so steep here, but the soil is very stony, and in places not more than 1 foot deep before the hard rock is reached. The Vines are younger here, and planting is continued each year, and this vineyard will most likely be the better of the two. We have seen the Vines during two or three seasons, but they did not present the appearance that they do now. The best season experienced prior to this was 1887, and the wine made from that vintage was better in quality than any

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM VILLOSUM VAR. MEASURESIANUM, *new var.*

In this extraordinary plant it is to be seen that which I have expected for a long time past, but it was none the less surprising when I came upon it in the private Orchid-houses of Messrs. F. Sander & Co., at St. Albans. It will simplify matters if I at once state that the variety under notice is in every respect a very fine form of the typical *C. villosum*, with, as it were, the colouring of *C. Boxalli atratum*, showing through it as one sees a design on a lighter ground in a stained-glass window. In every respect, so far as form goes, except in the narrower and more angular labellum, it is a true *C. villosum*. The upper sepal has a white ciliate margin, below that the colour is purple on a greenish-yellow ground, the base having black blotches on a glossy purple body colour. The petals have the dark shining Indian-yellow on their upper halves, as in ordinary *C. villosum*; the lower

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT BELVEDERE, BRIGHTON.

JAMES ASHDOWN, Esq., has long been known for the interest which he takes in the horticulture of the locality in which he resides, and the pride he takes in the small garden surrounding his house in the Ditchling Road. Of late he has turned his attention to Orchids, beginning cautiously, and buying only odd lots and small plants on which to experiment. Often has a smile passed over the features of the frequenters of Messrs. Protheroe & Morris' Rooms as a box of specially dried-up scraps has, on the fall of the hammer, been declared for "Ashdown;" but if they who then saw the plants at their worst were to observe them in the Orchid-house existing at Belvedere, in company of their enthusiastic owner, and his no less interested wife, they would be astonished at the wonders worked on plants which many persons have doubtless thought fit only for the rubbish-heap, and the singular, though evidently appropriate means, by which their resuscitation has been accomplished. Mr. Ashdown was good enough to give us his experience of a few important details which he had always found essential in establishing imported Orchids, good or bad, his own plants serving admirably to illustrate the lesson.

First, then, he never pots, blocks, or places any moss or any other material to any imported Orchid until it has shown by producing roots, and exhibiting a tendency to make growth, that it is in a position to imbibe a greater amount of moisture than is contained in the somewhat humid atmospheres in which he always suspends them at first.

The second stage of treatment is arrived at when roots are actually pushing, and growth appearing, when the plants are removed from their head-downward position on the irregular wire screen which runs down the middle of the house; a small quantity of sphagnum moss is lightly bound among the roots, and they are again suspended from the screen, but this time root downward.

When the final stage has arrived, and the plants by their abundant roots and more active growth tell him that they may now be placed as they are to grow henceforth, Mr. Ashdown, for the first time, varies the treatment, in order to suit the different genera, and various and singular are some of the expedients adopted; but all are alike successful, for that they are the invention of one who seems intuitively to understand the requirements of the plants.

In the final arrangement, the *Odontoglossums*, &c., are potted up; but many species which are supposed to thrive only in pots, such as *Zygotum*, *Masdevallias*, and similar Orchids, are grown on cones of sphagnum and peat, supported on discs of zinc, and suspended by wires, in the same manner as the plants in baskets are. A great number of the plants, however, are grown suspended,

and without basket or block, but simply with a ball of sphagnum for them to root in, and this is added to as may be required. Among the specimens, many curious things may be found, such as *Pleurothallis*, *Polystachyas*, *Hartwegia purpurea*, *Stanhopeas*, &c., while among the showy ones we noted *Vanda teresa*, growing grandly in cylinders; *Lælia tenebrosa*, different forms of *Lælia anceps*, and other showy *Lælias*, numbers of *Cattleyas*, among which the *C. labiata vera* predominate, numbers of *Dendrobiums*, and, indeed, of most other things of recent importation, and out of which some new varieties will doubtless flower. One thing that proves the correctness of Mr. Ashdown's treatment is the profusion of foreign plants, seeds of which have come on the roots of the Orchids, which come up with them, *Tillandsias*, *Solanums*, *Gesneriads*, and *Melastomads*, &c.; on one plant alone we noted three distinct species.

The greatest triumph of cultural skill, perhaps, is a giant *Sobralia*, which bears hundreds of flowers in the season, each flower 8 inches across—probably *S. Warszewiczii*, and yet it and a plant of *Aerides Fieldingii* were bought at auction years ago for less than a crown; that may be called growing an Orchid. The house has a pretty rustic arch at one end, clad with *Iloya carnosus*, *Asparagus plumosus*, *Epiphyllums*, *Ferns*, and foliage plants. Around the sides run staging where Orchids are grown mixed with *Gloxinias*, *Begonias*, *Veltheimia glauca*, and other curious bulbs, *Anthuriums*, and many odd and rare plants; and at one end a small collection of *Stapeliads*, *Opuntias*, *Cereus*, &c. Up the middle of the house many wires are strained, in some places several deep, and these are added to as required for the treatment of freshly arrived Orchids, and which form, as it were, a partition down the middle of the house, but which does not obstruct the view from side to side. Here hundreds of little Orchids are doing marvellously, and their culture might well convey lessons to many who already think they know all about it. But let no visitor think we are noticing a fine collection of Orchids, for the *Sobralia* already mentioned is the only large plant in the house; what we are glad to point out is, that much pleasure can be got out of Orchids for a very moderate cost, and Mr. Ashdown's garden affords the best example we have seen.

CATLEYA × HARDYANA.

A three-flowered inflorescence of a superb form of this fine natural hybrid *Cattleya* comes from the collection of Walter C. Clark, Esq., Orleans House, Sefton Park, Liverpool. The flowers are large, of fine substance, and of glowing colour. It differs from other forms of *C. Hardyana* in having darker-coloured sepals and petals, which have all the veining shown up by being of a darker hue than the ground-colour, which in places is nearly white. The front of the lip is broad and circular in outline, and finely crimped, of an intense crimson-purple, the centre rich orange colour. The variety is very fragrant, which still adds to its great attractions. It was an imported plant, bought as *C. aurea*, but unflowered, from Messrs. F. Sander & Co., St. Albans.

FORESTRY.

THE EFFECT OF DROUGHT ON THE GROWTH OF TREES.

This extremely dry season has been very unfavourable to the growth of freshly-planted trees, and many of them have suffered considerably. The easterly winds which prevailed in the early spring are also responsible for the destruction of many trees, especially Conifers, planted on shingly or gravelly soils. Only on low-lying, peaty, or clayey soils, have any new plantations retained their green appearance; nothing but great patches of brown dead leaves meet the eye elsewhere, and in great areas planted last year much will have to be re-planted.

A great obstacle to raising plantations of trees on Heath-land are the constantly-recurring fires, which break out, and extend with amazing rapidity, before

they can be extinguished. These fires usually kill the young trees, and, in some cases, large ones.

It is advisable to keep strict watch night and day during dry weather, so that the fire can be dealt with quickly. It is a good plan to break up the ground for a width of at least 50 feet around any plantations, so as to form a barrier against fire extending from unplanted to planted land. *John Garbett, Canford Woods.*

A TRAVELLER'S NOTES.

(Continued from p. 180.)

TOKYO.—I have obtained sixty specimens of Japanese woods, varying in weight, grain, colour, and other details, noticeable on close observation; and also a representative lot of Bamboos, Cereals and silks I have in hand.

Chamærops excelsa grows with great freedom in Japan, and is now flowering freely. The stipulate fibre at the base of the leaves, as well as the strong base itself, is of economic value; therefrom are manufactured brooms, brushes, twine, strong rope, most serviceable door-mats, &c. I recently bought all the products of this fibre I could hear of; it will make a most interesting exhibit. [Many of these were shown at the Temple Show]. The most famous place in Japan for *Wisterias* is the Temple of Temmanju at Kameido, a suburb of this vast city.

Round a pond (bridged by a characteristic semi-circular Japanese stone bridge) in front of the temple are numerous plants, both of the white and blue *Wisteria*, trained on a flat Bamboo support about 6 feet from the ground. These trees, of great age, produce many hundreds of racemes each, from 15 to 18 inches in length; they hang down through their trellised roof in the most glorious profusion, and present certainly one of the most beautiful floral sights of Japan. The white variety, known as *W. brachybotrys*, seems to flower a week later, but the plants are equally old and equally profuse with their magnificent racemes. Beneath these *Wisterias* are many low, broad benches, on which the Japanese sit, sipping their tea and smoking. Round the pond play many children, feeding the carp and gold fish; whilst through the centre of the grounds, over the semi-circular stone bridge wends the ever-constant stream of Thintoists going to worship Sugawara-no-Michizane in the Temple known as Temman Daijizai, "The Perfectly Free and Heaven-filling Heavenly Divinity." [See fig. in *Gardeners' Chronicle*, Feb. 25, 1893, p. 233.]

One of the most curious sights of Tokyo is the *Oji-zo-sama*, a fair held nightly in various parts of the city, at which are sold toys, plants, &c. The flower and plant stalls are most numerous. The fair, if it may so be called, is held in this quarter, not a stone's throw from the outer moat of the Imperial Palace, and along the "Giuzo," the great main artery of Tokyo, on the 7th, 18th, and 29th of each month, always at night. That held on the 18th inst. I visited, and rarely saw a more striking spectacle.

Along each side of many streets were arranged booths, in front of each flaring lamps, giving a strange colour to the Pines, the Pinks, the *Ardisia* berries, and the delicate Tea Roses. On a low seat sat the owner, a peasant, the poorest of the poor, selling at absurdly low prices, the productions of his bit of ground, situated somewhere on the outskirts of the city. Ever to and fro wandered a thick crowd of the poorest classes, clean in person, for no Jap is anything else, but wearing clothes old and worn, betokening their lowly state. Often one saw people carrying away their purchases, an old woman, bent with age, carefully bearing off an old Pine, as bent, crooked and old as herself; or a young girl with a child strapped on her back, carrying in her hands a porcelain tray, in which would be a piece of stone, resembling a rock; on its sides a stone lantern or two, at its base a small house; round it, pebbles, to be subsequently covered with water to make a lake; on its summit a clump of fresh, green, growing *Acorus gramineus*, a toy and a plant, nature and art in one, a lake, rock, house, lantern and forest reduced to the space of a dozen square inches.

The Pinks were lovely—splendidly cultivated. The *Ardisia crista* was well berried. *Potentilla fruticosa* was amongst the flowering plants, though the most numerous of all were Roses. Pines, *Retinosporas* and *Cycas* were the favourites amongst the non-flowering plants.

A curious sight, watching all this—the glare of the lamps, the stalls, the thick crowd, sometimes impassable, the noise of the vendors praising their plants, the purchasers quarrelling over the price, the ceaseless clack-clack of the wooden shoes, the con-

stant laughter on all sides; now varied by a sabred policeman, scarcely over 5 feet, removing firmly some unfortunate who had partaken too freely of saké; now by a band of socialists pushing and elbowing their way through the harmless throng, a proceeding which made the second secretary to the American Legation say, "Keep together—that's a bad lot." *Osunda regalis* is now commencing to flower, noteworthy as its young flowering shoots, warmed through and eaten with sauce, form a most palatable dish. The scales of young Lily bulbs with melted butter, a dish I have only seen at Kyoto, is also not at all unpleasant. The shoots of a small-growing Bamboo, when plucked young and treated in the Japanese fashion, are firm and crisp, forming an excellent vegetable.

The Botanic Gardens.—The herbaceous grounds and shrubbery are very full of labels, but of little else. Amongst the trees now flowering, a foremost place must be given to *Cornus macrophylla*, the whole extent of its long spreading branches is covered with flat heads of white flowers; it is a striking tree. *Styrax Obassia* is commencing to push. I note that it flowers here far more freely than with us; it is no exaggeration to say almost as freely as *S. japonica* does at Coombe Wood. *S. japonica* is later, from seven to ten days, and, as you can imagine, marvellously free.

Pinus koraiensis is very handsome. I have, so far, seen none but small specimens, but in this condition I prefer it to any of the four Pines found in Japan. Many of the quarters in which the trees are planted in straight rows are edged with *Bletia hyacinthina*, both red and white, now freely flowering. Tea is also used. It bears clipping, and forms a continuous, close, strong edging some 8 inches high. Amongst other flowering trees now to be noticed is *Robinia Pseud-acacia*, used for avenues; in this respect often alternated with Weeping Willows. Both are most cruelly pruned, the heads being cut till they are flat. *Halesia corymbosa* and *Gleditschia japonica* are full of bud, and promise to be fine shortly. *Spiræa Thunbergia* and *S. prunifolia* were over; but *S. cantoniensis* (our *Reevesiana*) and *S. betulifolia* were in full glory—truly handsome shrubs. *Menziesia pentandra* (a red *Enkianthus japonicus*, as far as I could see) was exceedingly pretty, as free and not unlike *Pieris japonica*, with flowers of a pleasing dull red colour, the stalks of the young shoots being also quite red.

Certainly the most striking thing in the Botanic Gardens is the landscape garden, in pure Japanese style, situated on the side of a low hill, with a most picturesque lake at the bottom; it is most favourably placed, and one of the best pieces of work I have seen. The hill, backed by Oaks, *Abies firma*, and other large trees, is covered with many hundred perfectly-clipped thick bushes of *Enkianthus japonicus*, now a lively green with their young shoots; amongst these are young Pines and Maples. Over the lake hang flat trained and twisted Pines; where it narrows are stone bridges, or large flat stones in the water for one to walk over, whilst on the bank facing the hill is a tea-house, where the Japs sit and moon away their idle hours.

A Rose Nursery.—It being now the season for Roses, with an introductory card I called on the man bearing the reputation of being the leading grower in Tokyo.

His nursery is situated in a district apart from all others I had as yet been in, but as full of nurseries as any other. The number of such establishments round Tokyo is very great. It is difficult to form even an approximate estimate of the number, but that it exceeds that of the growers at Boskoop, Ghent, the Balb grounds of Holland, and the seed-growers round Erfurt or Quedlinburg, is, I think, clear.

It is easy to wander for a day from nursery to nursery in one district alone, return the next day and continue one's walk, and yet never enter a previously-visited establishment. Most are neat and clean, and contain a stock, the striking similarity of which I have already referred to.

In all the districts, Pines and *Retinosporas* in pots, form by far the largest percentage of cultivated plants. In some, much care is devoted to Plums and Cherries, in others Oranges are a leading feature; whilst in those establishments above the ordinary, young plants of nearly all those our leading men in England are acquainted with, may be generally noticed in an afternoon's stroll.

The Roses are chiefly Teas, and certainly not the latest European varieties. As might be expected, they grow with great freedom, often make large bushes, and flower in profusion. They are pruned long, as in India, in my opinion too long to make

smart plants, but so well is the wood ripened that the plants do not suffer. Japan is not 20° nearer the equator than our country for nothing.

Variiegated plants are much cultivated. Podocarpus, Ophiopogon, Cleyera, Quercus cuspidata, Daphniphyllum, Pittosporum Tobira, Ilex latifolia, Eriobotrya japonica, are amongst those most frequently seen, many producing both silver and golden variegated forms. *James H. Veitch.*

(To be continued.)

NOTES FROM KEW.

NYPHÆA LAYDEKERI VAR. *ROSEA*.—This beautiful Water Lily is a worthy addition. It is in bloom in the Water Lily-house at Kew, and is one of the more interesting kinds in flower in that fine collection. The flowers are not large, but of pretty shape, and when first expanded they are of a pink colour, which deepens with age to crimson. Japan has given us few more interesting plants, and we hope that it will succeed in a lower temperature than the house at Kew, so that it may be grown by those who have not such convenience. *T.*

NOTES FROM ANTIBES.

OUR old and valued *confrère* and contributor, Mr. Naudin, sends us from Antibes notes of two plants, his success with which he ascribes to the favourable climate of Provence. He says:—"The first is *Beschorneria Parmentieri*, which, according to M. Ed. André, should be called *Agave Roezlii*, or *Fourcroya Roezlii*, after having been already successively named *Roetzlia regia*, *R. bulbifera*, *Yucca Parmentieri*, *Y. Toneliana*, *Y. argyrophylla*, and then *Beschorneria Parmentieri*! The plant is from thirty-two to thirty-three years old. It has a single stem 8 feet high, crowned with a dense tuft of long, glaucous, entire leaves. In May, from the summit of this stem there arose a pyramidal panicle with long branches covered with white flowers, to which succeeded hundreds of ovoid fruits, which hung down like large Plums from all the secondary ramifications of the branches. This wonderful panicle, such as I have never before seen, grew in a few days to a height of 23 feet; this measurement, joined to the 8 feet of stem, gives us a total of more than 30 feet as the height of the entire plant. At the time of flowering it was truly splendid. The white flowers opened widely, and so differed much from those of *Agaves*, suggesting a little the blossoms of a *Tubercse*. A not less curious fact is, that besides the fruits this inflorescence produces thousands of bulbils, which present the appearance of a large green and leafy panicle; these bulbils falling to the ground take root there, and thus the plant has therefore a two-fold method of reproduction. [Is this not *Fourcroya Bedinghausii* Koch, Baker, *Amaryllids*, 203; *Gard. Chron.*, April 18, 1891, fig. 99?]

A NEW DATE PALM.

"The other plant of which I wish to tell you is more important to us. It is a Phoenix, found in a garden at Nice, and bearing splendid clusters of Dates, black as ink, of the size of ordinary African Dates, fleshy, soft, and luscious, some containing stones, others with none, and all eatable. I look upon this new Date as a valuable acquisition for Provence, which will thus find, I hope, a fruit for future exportation. But, botanically speaking, what is this Date? No one knows. I have some reason for believing that it is a large-fruited variety of *Phoenix senegalensis*, characterised by the black colour of the fruits, which are the size of Olives; but it is also quite as likely that this is a hybrid of *senegalensis* and *dactylifera*. The chief thing is to multiply this variety, either by the seeds in the stones (whereby a doubtful result would ensue), or more surely by planting suckers or slips from the roots of the tree, if these are produced. All the Phoenix, cultivated or wild, hybridise one with another with the greatest ease, so that we can never be certain whether we have before us specific types or hybrids. I have given to our new Date the name of *Phoenix melanocarpa*. *Charles Naudin.*"

SAXIFRAGA MACNABIANA ×.

It is somewhat astonishing to find that this handsome Saxifrage is not very well known at present especially as it seems to possess all the qualities desirable to render it popular in the rocky or herbaceous border. On looking up its history, I find it mentioned by Mr. R. Lindsay in the *Gardeners' Chronicle*, June 13, 1885, p. 770, where it is stated that *S. Macnabiana* is a garden hybrid, raised in the Botanic Gardens, Edinburgh, in 1875, from seeds produced on *S. pyramidalis*—or as it was misleadingly called *S. nepalensis*. The pollen parent is supposed to be *S. lingulata* by some, and *S. Hostii* by others; but it would be difficult to decide this point unless by means of experiment, as has been done in the case of some Orchids the parentage of which was at one time doubtful. In all probability, the plant

FIG. 51.—SAXIFRAGA MACNABIANA ×.

was brought under notice on the above occasion owing to the fact that a plant was submitted to the Floral Committee of the Royal Horticultural Society in May, 1885, when it received a First-class Certificate. Since then very little or nothing at all appears to have been said in the horticultural press about it, nor is it mentioned in Mr. Nicholson's *Dictionary*, and this leads me to the conclusion that it has not yet been propagated sufficiently to become common. In June last year at one of the Royal Horticultural Society's meetings in the Drill Hall, Westminster, among a group of hardy plants contributed by Messrs. Paul & Son of Cheshunt, I espied *S. Macnabiana*, and, considering it a remarkably pretty little plant, hastened to portray it as well as I could in my sketch-book, from which the accompanying illustration has now been prepared. At the same time I noted the following points:—*S. Macnabiana* is dwarf and caespitose in habit; it has lanceolate leaves, with whitish serrated

margins, and a somewhat furfuraceous or powdery surface. The peduncle is stout and strong, erect, but not tall, and is clothed with hairs, each of which has a globular gland at the tip. The flowers are borne freely, and look strikingly pretty, owing to the fact that their pure whiteness is relieved by numerous specks of rose or crimson on the lower half of the petals.

It may be mentioned that *S. Macnabiana* is not the only hybrid Saxifrage known. Mr. J. G. Baker of Kew, who contributed a valuable paper on "Saxifrages" to vol. xi. of the Royal Horticultural Society's *Journal*, gives a list of fourteen hybrid Saxifrages, with their parentage. In the same volume Mr. George Paul dilates on the culture of this useful genus; and, by the way, he just mentions the subject of this article. In addition to this, Mr. G. Renthe contributes a very interesting paper on the same subject; and the whole being in a handy and concise form, should prove most valuable to those who take a keen interest in Saxifrages. *John Weathers.*

FUNGI ON MUSHROOM-BEDS.

GARDENERS are sometimes puzzled to account for the appearance on their Mushroom-beds of certain forms of fungi which are not Mushrooms, but which occupy the place and effectually diminish, if not entirely supersede, the crop for which they had carefully provided. We have heard strong invectives applied to those who have supplied the "bricks," to the effect that they have substituted an inferior article, and hence that their consignments are untrustworthy. In this connection, it is only fair to remember that one or two instances of failures of this kind are by no means evidence that the spawn was intrinsically bad or mixed. It must be demonstrated that the majority of the consignments of any given salesman have failed, in order to fix any blame upon the vendors, and yet this is not done before the blame is settled upon the "spawn" and its providers. Suppose a firm to distribute "bricks" to a hundred purchasers, and only three are known to have failed, whilst the residue may be assumed to have succeeded, it would undoubtedly be unjust to shift the mishap upon the vendors. Moreover, it is not the kind of mishap which can be attributed to bad spawn, that it should produce fungi of another kind, but rather that it should fail to produce fungi at all. It is just one of those problems which requires to be solved, whether any other species of *Agaric* can be cultivated artificially by means of prepared "bricks." Hitherto the possibility has not been demonstrated. How then, it will be asked, are we to account for the occasional appearance, in considerable numbers, of totally different species of *Agaric* upon Mushroom-beds, properly constructed? We should reply that, in such cases, the cause is a local one, and must be sought within the confines of the Mushroom-house, and not attributed to mixed spawn. No one would desire to dogmatise on a subject which is involved in so much mystery, but the comparative rareness of such phenomena point to local causes.

One of the most common species which has been known to invade Mushroom-beds, is a small and rather slender white *Agaric*, with white gills and white spores, which usually grows in dense tufts, sometimes on old Mushroom-beds which have already furnished a good crop of the true cultivated Mushroom, and sometimes on beds which have not produced a Mushroom at all. This particular species is *Agaricus (Clitocybe) dealbatus* (figured in the *Gardeners' Chronicle*, 1861, p. 312), a fungus which, in its normal condition, is to be found in woods, Fir plantations, and on dead leaves. The cap is of an average diameter of 2 inches, flattened, and then depressed, with a waved and irregular margin; the gills are thin and crowded, attached to, and running a little down the thin stem. The odour is rather faint and mealy, and the taste pleasant. It is not only perfectly harmless, but is decidedly edible, and furnishes a very delicate dish of a much milder and less pronounced flavour than the cultivated Mush-

room, although not possessing any marketable value. By what means does this species, which is a lover of woods, become introduced into Mushroom-houses? We can only suggest, as a possibility, that dead leaves, containing spawm, or spores, may have been used in the construction of the beds, for there can be no suspicion that the mycelium, or the germs, were concealed in the artificial Mushroom-spawm, as, in its natural state, it is never found growing upon dung.

A few years since, Mr. Worthington Smith announced the discovery of a larger Agaric, and one of a dangerous character, which invaded a Mushroom bed. The gills are at first whitish, becoming dingy with age, and the spores of a pale dingy clay-colour. In external appearance this *Agaricus fastibilia** somewhat resembles a Mushroom, but the gills are never so dark, and there is not such a distinct ring around the stem, only a circlet of delicate threads. The cap is 2 inches or more in diameter, of a pale yellowish or tan colour, and rather thick and fleshy, but quite smooth and even, and seldom depressed in the centre. The stem will reach 2 or 3 inches in length, and about half-an-inch in thickness, rather thicker at the base, solid within, and externally whitish, clad with white scales at the apex. Usually, two or three specimens grow together in a tuft, but sometimes they are solitary. The odour and taste is something like that of Radishes, but the odour becomes stronger with age, when it is distinctly heavy and unpleasant. This is one of the species of which the universal impression is that it is dangerous to be eaten, and when the full odour is taken into account, few would be induced to test it. Dr. Lambotte writes, that in Belgium it is regarded as poisonous, and Curdier that in France it is suspected, whilst Gilet stigmatises it as poisonous. In its natural state this species grows on the ground in woods, but is not particularly common, or not so much so as another species, *A. crustuliniformis*, which it much resembles. As it does not grow on dead leaves, its occurrence on Mushroom-beds cannot be included in the same hypothesis as the preceding species.

Quite recently, a tufted Agaric, which was too dilapidated when it reached us to determine the species, came up plentifully on a Mushroom-bed, in consort with the Mushroom. It certainly was new to us in such a locality, and had the appearance of belonging to the sub-genus *Hypoholoma*. Dense clusters of six or eight stems, of about the thickness of wheat-straw, and 3 inches in length, supported convex caps of not more than an inch in diameter, smooth, and of a tan-colour, turning black with age. The gills were broad, and nearly black, and the spores dark brown, under the microscope (about 8 by 5 μ); the stems thickest at the base, and clothed half-way up with a dense, closely-addressed white down, at the top yellowish-brown, and longitudinally striate. No trace of veil could be seen, either on the stem, or the margin of the pileus, otherwise it seemed to be closely related to *A. leucotephrus*. Of course, it is vain to speculate on the manner in which this little species found its way to such a habitat, which would scarcely be its natural one, but it is quite certain that it could not be a degraded form of the ordinary Mushroom. We have been asked to account for the presence of these extraneous fungi, and to furnish instructions for getting rid of them, but we are not in possession of sufficient positive information for either. We are equally unable to account for the advent, for three successive years, of excellent examples of the true Mushroom in a London coal-cellar, growing out of the mortar of the brickwork, 4 feet above the ground, and attaining in this unfavourable locality a diameter of 6 inches, with no evidence that a Mushroom-bed had ever been laid in that cellar within the memory of the present inhabitant.

Incidentally, other Agarics may have established themselves on Mushroom-beds, but a more annoying visitor is a black nodulose *Sclerotium*, which is immersed in the soil, and takes effective possession. It

was first seen more than a quarter of a century ago, and many times since, so that its appearance is now by no means uncommon. Mostly, it never advances beyond the sterile *Sclerotium* stage, but in its perfect state it develops a black, irregularly, club-shaped head, or cluster of heads, and is known as *Xylaria vaporaria*.* It is closely related to the very common "candle-snuff" fungus, which appears on nearly every old stump, and, like that, contains dark elliptical sporidia, which are enclosed in narrow membranous sacs, or asci, and these again are developed in globose cavities, immersed in the substance of the clubs. By keeping the *Sclerotia* immersed in damp sand, Mr. Currey succeeded in obtaining the perfect fruit, but the *Sclerotium* is in itself a hibernating condition, or a sort of perennial compact mycelium, which has no proper fructification of its own. How they originate in the beds, and what is the stimulating cause, has not yet been ascertained, or any other method of clearing the pest discovered, except by demolishing the bed, or such portion of it as may be affected by the *Sclerotium*.

There is still another enemy which the cultivator of Mushrooms has to contend with, and that is the agent which produces distortion, coalition, and absorption of the gills, so as to bring about a state so much resembling the early stages of *Hypomyces* as to leave no doubt of its affinity. This genus of parasites, when mature, belongs to the *Sphaeriaceae* fungi, allied to *Hypocrea*, and forms a stroma upon Agarics and other fleshy fungi, in which the perithecia are immersed,† containing the sporidia. In the early stage of this disease conidia are produced, under the form of some mould, which varies according to the species. Subsequently the stroma and ascerous fructification are developed. The latter stage has not been met with on Mushroom beds, but a very early condition is by no means uncommon, in which the gills are traversed by mycelium, and distorted, the hymenium remaining barren and pale, and the entire Mushroom giving evidence of disease. We have never been able to obtain examples in a sufficiently advanced condition to show the conidia, and hence the evidence is so far faulty, but the peculiar appearance of the affected gills leads to the conclusion that this disease is caused by some mould, which is the forerunner, and constitutes the conidia of some *Hypomyces*. It need scarcely be added that such affected Mushrooms should not be eaten, but should be removed from the beds and destroyed as soon as the disease is detected. *M. C. Cooke*.

COLONIAL NOTES.

Will you pardon me for asking for a little space in your old and valuable journal, to ask your readers if they know of a winter Melon, that is to say, a Melon the fruit of which, when it comes to maturity, may be stored away like a number of Pears, Apples, &c. I have in my mind in writing a beautiful Melon, which my father brought out to South Australia in the early part of 1839. The seed was received from Malta. The fruit was of an oblong form, from 6 to 12 inches long and 4 to 6 inches in diameter, smooth, and almost ivory-white; the flesh was also white, and when fully matured, of a delicious flavour. After a few years in South Australia, the fruit lost its character, from the flowers being fertilised by the pollen of other varieties of the Melon family. This plant is of further interest, as probably its fruit was the first Australian fruit exported to England. It arose thus: My father, having a friend returning to England, packed up for him a few of these Melons for use on the voyage, at the same time asking him to return word as to whether any reached England in a sound condition. The answer received was that several of the fruit had reached England in excellent order. This must have been 1845 or 1846, but as I am writing from memory, I cannot be positive. Should any of your numerous readers know anything of the Melon in

question, and would forward me a few seeds, I should feel extremely obliged; or should seeds be purchasable of the seedsmen, I should be glad to know where through the medium of your paper, if you will allow it. *F. M. Bailey, Colonial Botanist of Queensland, Brisbane.*

ANGRÆCUM O'BRIENIANUM.

Page 8 of January 7 number of your paper contains a reference to *Angræcum O'Brienianum*. Some three or four years since, I purchased what I supposed to be this Orchid, from Messrs. Graham & Co., florists, under the name of *A. gladiifolium*. I could find no description of this Orchid in any work, including Williams' book. I am not able to give a technical description of it, the more so that it is not in flower at present, though it is likely to be so in about a month. The following description, however, will be pretty near the mark, as far as the plant is concerned, of which I enclose a photo. Raceme, five flowers, white, about the size of a white Azalea, scented, long-spurred; leaves stiff, 9 inches long, 1½ inch broad, ¼ inch thick, not veined, alternate; leaf when fully grown, slightly split at the base on the upper side, from which the new leaf shoots. It is fair to myself to say, that until the last year I had not been growing this plant in heat; consequently the growth was slow. Since growing it in heat, it has thrown up the three last leaves. I mention this as reasonably accounting for the smallness of the plant, considering the length of time that I have had it. If it would be likely to interest you, I would be pleased to send you a photograph of my garden. *Hugh Dixon, Sydney, July 24.* [Kindly do so. Ed.]

HARDY CYCLAMENS.

WORTHY of the choicest spots in the garden is the autumnal hardy Cyclamen, whose flowers in thousands are now peering out from many a corner in my garden, both in sun and shade, though they seem to prefer shade. I mean the Cyclamen which claims to be a native of England, and which seems to make itself at home in gardens more readily than any other. Fifteen years ago the late Mr. Tyerman sent me a large supply of these from Cornwall; I think he called them *Cyclamen europæum*. This species was figured in the first edition of *Sowerby* as *C. europæum*, and Bentham in his *British Flora*, calls it *C. europæum* (Linnaeus). I never questioned the correctness of this name until a few days ago, when a box of Cyclamens in flower, recently collected, was sent me from Switzerland; these had spherical bulbs, round leaves with even margins, and very sweet purple flowers, much smaller than those in my garden. These collected plants the *Gardeners' Chronicle* helped me to identify as the true *C. europæum* of Linnaeus. The authentic name of the other species, claimed as native, is *C. neapolitanum* (Tenore). It is also called in the second edition of *Sowerby's British Plants*, *C. hederæfolium*. The last name would be appropriate enough, if Tenore's name had not held the field before it; for the leaves are angular, and prettily marbled with grey, as we often see in Ivy when it creeps on a bank. As for the cultivation of *C. neapolitanum*, I find it will do well anywhere, provided a substantial layer of broken stone is put for it to grow upon. The tubers should rest on the stones, which should be covered with 3 inches of leaf-mould. If they work up to the surface they should be again covered with leaf-mould. They begin to flower early in August, and last for about two months; the colours are various shades of pink, a few being pure white. The leaves come out about three weeks after the first flowers, and last till the seeds are ripe, in the following June. I generally collect the seeds and sow them in boxes, to save them from birds and mice. The seedlings are ready to plant out in two years, and no one can grudge the little trouble they give, with the prospect of gradually filling every dark corner of his garden with so charming a flower. I find that hardy Cyclamens do particularly well under Spruce Firs, the decayed needles

* *Gardeners' Chronicle*, Vol. XII., 3rd Series, p. 801.

† Plowright, on "British Hypomyces," *Grevillea*, for 1882.

* See *Gardeners' Chronicle*, October 27, 1877, p. 520.

of which seem to contain all they require for their welfare. What I have said refers especially to *C. neapolitanum*, which is, I believe, the commonest hardy Cyclamen in English gardens; but I have also grown for many years, treating it in the same way, *C. Coum*, the flowers of which are smaller, and vary in colour in the same way. They begin about Christmas and continue till the end of March, defying frost and storm. The leaves are produced before the flowers, and resemble those of *C. europæum*, for which the plant might be mistaken but for the shape of the tuber, which is not round but flattened. There are two or three other European species of Cyclamen, but I have no experience of them as hardy garden plants. *C. Wolley Dod*, *Edge Hall*.

PEDIGREE OR GRADE RACES IN HORTICULTURE.*

By HENRY L. DE VILMOSIN, PARIS.

IT is a well-established fact that the life-work of plants is to make the mineral wealth of the earth fitted for the use of animals and of man. Now it is clear that the plant's work can be done well or ill according to its more or less perfect fitness to its functions. It is, moreover, within the power of man to consider, and to some extent control, the efficiency of plants in regard to their work, to select, and to increase the best only, and by continued selection to develop more and more the good qualities of each kind. In this way man raises races and varieties of plants which do their work best and quickest. Heredity is the lever by which the results of the study and care and perseverance of the raiser are fixed, so to say, into the most valuable of the plants grown for man's use or delight. We have no more powerful means of improvement of vegetable forms. All the care, food, and protection given to plants may make them larger and finer, but only selection among many of the same kind with the help of heredity can fashion an enduring race of plants with special good qualities for our farms, gardens, or orchards. Chance seeding may yield some very good finds, as sometimes a good hit is made by shooting at random. But no good marksman will, even after the luckiest of chance shots, dispense with the use of his eyes and judgment for the rest of the day. In the same way no experienced raiser will trust to chance in the choice of the seed from which he expects some precious results. He will gather it from one plant seen among many, and will have good reasons to show for his choice.

It is plain that selection was not at all times done with such thought and skill as it is now; but ever since plants have been cultivated an evident improvement has been going on for our benefit, and fixed and valuable races of field plants, vegetables, flowers, and fruits, were known to the oldest nations, and are mentioned by the oldest writers. Since the settlement of America, a new field was opened for good work, which yielded a splendid crop of honour and profit to American as well as to European cultivators, and through them to their respective countries.

Let anyone who doubts the high value of selection, look at our fine races of Cabbages, Kalea, Cauliflowers, Kohl Rabi, and Rutabaga, and compare them with the wild Cabbage of our western shores of Europe; let him compare our fine garden Beets and our Mangels to the wild Beet of the Mediterranean shores; let him compare the Tomatoes and Potatoes of to-day with the wild South American plants, and he will see proof that only human thought and skill have brought about such wonderful changes—many of them in our own day, many, on the other hand, have been hundreds of years in existence. In the Tomato and Potato we have two distinct examples of garden races, viz., (1) those which are increased from seeds, as the Tomato, and (2) those which are increased by division of a plant, as the Potato.

Even where we divide the plant itself, heredity is of some importance, as new varieties can be raised from seed only, and it is by no means indifferent to gather seeds meant for the purpose from one variety of Potato or from another. Distinct groups of races are seen in the Potato, as the Rose tribe, to which the early Rose, late Rose, and many more can be referred. Just in the same way, a nurseryman who sows Pear pips in search of new varieties will take good care to take them from some old sort, the

parentage of which gives good hopes of success. It follows, then, that even where increase by division is the rule, the knowledge of the quality and history of a plant may be of essential importance.

WHAT HEREDITY IS.

Where selection is done with skill and care, the improvement of many kinds of cultivated plants effected by its means is invaluable. The large Pansies, the huge hybrid Gladioli, the large-flowered Cannas, were all brought from the state of small flowers to their present excellence in our own day by careful observers, who, watching every variation, and keeping an exact record of the descent of all their plants, turned to the best account the wonderful action of heredity.

That plants are endowed with the power of changing to some extent under altered and varying conditions no one will deny who knows even a little natural history. Such changes occur in wild nature as well as under cultivation, and by the action of heredity may be transmitted more or less faithfully to the next generation.

But an all-important fact must be recognised and remembered. It is, that in the wild state only such variations have a chance of enduring as give the plant in which they occur some advantage in its life. Many variations appear every year which soon disappear, because they are a loss, not a gain to the plant. Suppose, in the wild state, a Potato plant with short stems, and late sprouting tubers in a mass at the base of the stem. Such a plant would not have any chance against rank-growing and early-shooting varieties, and it would soon perish. Still, some such characters belong to some of our best Potatoes. This is owing to the action of man, who throws his power into the balance when cultivating plants which are useful or pleasant to him, and who gives the weakest plant, if it is for some reason a favourite with him, all the advantage he can to make it thrive and answer his purpose. Most of the variations induced in our garden plants are not in favour of the plant if in a "free fight" with its kind in Nature. All our improved roots, as Carrots, Turnips, Beets, make an early and succulent growth for our own benefit, but not at all for their own good. If left to their fate to struggle with their own wild forms, they would soon have to take a "back seat," and very likely soon perish. It follows, then, that varieties improved from man's point of view must receive kind treatment and richer food than wild forms of the same plant. The cultivated plant, like the domesticated animal, yields in a measure its powers of self defence to adapt itself to our service. Man must in return provide for its safety and nourishment. In the improvement of plants the action of man, much like influences which act on plants in the wild state, only brings about slow and gradual changes, often scarcely noticeable at first. But if the efforts towards the desired end be kept on steadily, the changes will soon become greater and greater, and the last stages of the improvement will become much more rapid than the first ones.

I may relate here in a few words an unpublished experiment which I have been conducting for more than twenty years, from 1872 to the present year. It has consisted in cultivating one of our Parsley Worts (*Anthriscus sylvestris*), a European weed, in order to change its slender and much-forked roots into fleshy, straight, and clean roots, say like those of the Parsnip. Among the first batch of roots raised from wild seeds a dozen were selected with a tendency in their roots to larger and straighter bodies. Each root was planted separately, and its seed harvested separately. Of the dozen lots obtained, eight or nine were discarded at once, and roots were selected only in such lots as exhibited some trace of variation. Again a dozen roots or so were chosen, a drawing made of each root, which was afterwards planted separately. I have sketches of all the roots selected, so that it is possible to follow all the stages of variation of each plant living at this day. For the first ten years the changes were slight, but now they are more and more marked with every generation, and in some of the lots the straight and smooth roots are the most numerous.

My object was not to create a new vegetable, as the roots of *Anthriscus sylvestris* have such a strong taste of camphor as to be quite uneatable, but simply to show that careful and continuous selection could transform a wild plant in years that do not equal a quarter of the span of many human lives. Like results were obtained by my grandfather with the wild Carrot, only its results were open to controversy as to possible crosses between garden

varieties and the wild strain. No such objection can be raised in the case of my weed Parsley Wort.

(To be continued.)

PLANT NOTE.

CELSIA CRETICA.

SEEING a reference to this plant on p. 218, I am induced to say that of all the plants grown of what are termed a common character, this is the most free-flowered. Half-a-dozen plants raised from seed will flower continuously and have a good effect in the greenhouse all the year round. Directly a flowering shoot is removed another pushes from the base, thus the display is kept up. The colour of the flowers is pale yellow with a brown or chocolate eye, and they are pleasantly perfumed. *E. M.*

WATER LILIES AT BARODA HOUSE, KENSINGTON.

HORTICULTURE is carried on with difficulty in London, and the reasons are obvious. It is surprising that such good results should be obtained under adverse circumstances, and in many places within the metropolitan area great success is achieved in the culture of various kinds of plants. The Water Lilies in the garden of Sir E. Harland, Baroda House, Kensington Palace Gardens, are an illustration of successful plant culture in London. This class is rarely seen well done in private gardens, and although the collection is not large, it is interesting, far more so than the typical conservatory filled with Palms and foliage plants.

The Water Lily-house, for such it may be truthfully called, is of large size, and divided into two compartments. This fine structure is lighted by electricity, is connected with the house by a covered way, embellished with flowering plants, and is in every respect suitable for the chief things cultivated. In one compartment or division the cooler species are placed, British kinds and others, which need different treatment to those from the tropics. The partition between is of glass, but hard lines are toned down as far as possible by an imitation rustic bridge of Portland-cement, which, especially by electric light, has a quaint and picturesque effect. The Lilies in each case are grown in basins of Portland-cement, and the structure is about 2 feet 6 inches in height, so as to bring the Lilies closer to the eye. There is no occasion to stoop down to see them, and the formal appearance of the cement is hidden by the growth of Ferns, *Ficus repens*, and similar things, which in time will quite hide its bareness. If the basins are not very large, they still contain many species and forms of *Nymphæa* in good health, and there is a ready way of obtaining a fresh supply of water.

The chief *Nymphæas* in the collection are the following beautiful kinds. It would be well if this class were more grown in gardens, and a collection of Lilies in a large conservatory is not difficult to manage. *N. cœrulea* is one of the more interesting species. *N. stellata* is similar, and there are many varieties requiring the warmest house, as may be supposed from its habitat, tropical Africa, from whence the species was introduced in 1812, and figured in the *Botanical Magazine*, t. 552. A form of *N. stellata* in the collection is *N. a. cyanea*, which was introduced from India in 1869, and recorded in *Botanical Magazine*, t. 2058. The flowers are blue, and very pretty. One of the finest of all is *N. dentata*, which is a form of *N. lotus*. This is a very handsome kind, the flowers broad, white, and the leaves large. It was introduced from Sierra Leone in 1845, and is figured in *Botanical Magazine*, t. 4257. Without this fine Water Lily, no collection is at all representative. A cool-house species is *N. pygmaea*, and was introduced early in the present century from Northern Asia. The hybrid *N. devoniana* is also represented.

Although *Nymphæas* are the leading plants in this

* Read before the Seedsmen's session of the World's Fair Horticultural Congress, Chicago.

large conservatory, many other plants are cultivated. Orchids are grown in considerable numbers, *Odontoglossums*, *Calanthes*, *Cattleyas*, and other types being well represented; and such water-plants as *Aponogeton distachyon*, *Vallisneria spiralis*, and *Villarsia nymphæoides* are in the collection. Of Palms, we saw one of the finest specimens in the country of *Areca lutescens*, and such flowering plants as *Gloxinias* and tuberous *Begonias* were in full bloom. *Caladiums* are of interest, especially the dwarf *Le Nain Rouge*, which is a good companion to the well-known *C. argyritea*. The former has reddish leaves, and is very dwarf and compact in habit, a most useful decorative plant.

The house is adorned with a variety of climbers, including the *Lapageria alba*, *Aristolochia elegans*, and the old but beautiful *Gloriosa superba*. The two latter are not often seen in gardens, but there is no reason why they should be neglected. *A. elegans* is one of the best of the genus, the flowers beautifully marked, and borne in quantity. A variety of *Petunia* grown very largely is *Bull's Snowball*. The flowers are pure white, and the plants quite specimen size. It is one of the finest kinds we have seen, being free and distinct.

We understand that Sir E. Harland intends to get as complete a collection of Water Lilies as possible, and in time this garden will prove one of the most interesting in the vicinity of the metropolis. *Visitor*.

TREES AND SHRUBS.

SPIRÆA LINDLEYANA.

REVERTING to the notice of this shrub by "R. D." at p. 210, I can testify to its usefulness as a showy plant. It is easy of propagation, by taking the suckers which spring up from the roots in autumn, and grow into large bushes in a short space of time. In South Hampshire, *Spiræa Lindleyana* does not die down in the winter. The finest plants that I ever saw of this *Spiræa* were in the grounds of the late Dowager Marchioness of Huntly at Orton Hall, Peterborough. These were planted at the back of a large rocky, and the effect was really grand when the long panicles of bloom drooped at least 2 feet deep. *E. M.*

ROBINIA, CLETHRA, &c.

From Messrs. Vertegans, of Chad Valley Nurseries, Birmingham, we have received specimens of the following trees and shrubs. They are mostly old friends, but far less commonly met with than their merits deserve. Some are fit for the plantation, some for the shrubbery, and others as isolated specimens on lawns or for effective beds:—

Robinia hispida.—A species destitute of spines, with large elliptic leaflets, and racemes of rosy-lilac flowers. The herbaceous shoots are covered with fine setæ, from amid which project long, purplish, glandular hairs. The peduncles and the calyx are studded with similar hairs. What the object of this investiture may be, we do not know; it may be for the purpose of deterring unwelcome visitors. The tree is a native of the Southern Atlantic States of North America.

Robinia pseudacacia semperflorens is a form of the common False Acacia, which blooms on the wood of the year. Its peduncles and calyx are entirely glabrous. More than thirty varieties are known and catalogued, but we do not see many of them in gardens.

Clethra tomentosa seems hardly different from the old *C. alnifolia*. It is a hardy shrub, with shortly-stalked obovate, oblong leaves, wedge-shaped at the base, glabrous above, very downy on the lower surface, finely saw-toothed at the margins; the long clusters of white flowers are placed at the ends of the shoots. The five separate petals puzzle a young botanist, so that he does not recognise that he has a Heath-wort to deal with. The porous anthers, however, should give him the clue. The shrub is a native of the Atlantic States of America.

Rhus Osbeckii.—A bold, massive-looking shrub,

with dark brown bark, stalked leaves, the stalks long, and widened at the base; the blades unequally pinnate, with two side pairs of pinnæ, and one terminal all oblong acute. The midrib between the pairs of pinnæ has a narrow wing of leafy substance on each side. The flowers are very numerous, greenish-white, and borne in terminal, much-branched pyramidal panicles. It is a native of Japan.

Aralia canescens.—A shrub with very large spreading loosely bipinnate foliage, the ultimate lobes ovate, broadly acute, dark green, and rough on the upper surface, greyish beneath. The numerous small whitish flowers are borne in much and loosely-branched panicles. Whether this is the true *A. canescens* of Siebold & Zuccarini, or the *Aralia chinensis* var. *canescens* of gardens, we are not sure, not having been able to compare it with native specimens.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

GENERAL WORK.—Much work will now have to be done if the garden is to be kept tidy, as weeds now grow apace, and with the falling leaves, the clearing away of crops, together with other work, there will be sufficient to keep all hands busy. Do not allow any weeds to grow, or decaying vegetables to remain on the ground. All such should be collected into the rubbish-heap and covered with soil, or if an offensive smell is feared, burned.

POTATOS.—Many varieties will be ready for lifting. Choose for the first digging those whose skins are not easily rubbed off. Having dug the tubers on a dry day, allow them to remain on the ground for a few hours before storing. Look over Potatoes in store, removing diseased tubers. The seed tubers should also be occasionally examined.

CELERY.—Mid-season and late successions will now require moulding-up, and before setting to work thoroughly moisten the soil in which the plants are growing, as it is not easily done after moulding. Remove damaged outside leaves and offsets before watering the rows. This done, tie the stalks together loosely with a piece of soft bast. In earthing-up always break the soil finely with the spade, and press some firmly round the stalks with the hands, then add more with the spade, and leave a line of spits on the shoulder of the ridge for the next earthing-up. Late Celery needs thicker ridges than that which will be consumed early in the winter. If slugs or snails are numerous, dust some soot on the soil along the rows after earthing-up.

PARSLEY.—The latest sowings will need thinning, the plants drawn out being transplanted to a sheltered situation to be protected during winter. Those left in the drills should have a space of 6 inches between the plants.

AUTUMN ONIONS.—When the plants are forward enough transplant them without delay, for unless the roots take hold of the soil before frost sets in, they will be lifted out of the ground by frost. Autumn transplanted Onions have an advantage over those put out in spring, especially if the season should be a dry one. The ground on which Onions are grown cannot be too rich. Select the strongest plants for transplanting, and leave the others in the seed-bed till the spring, when they may be thinned out to 3 or 4 inches apart, according to the size to which the varieties grow. In lifting them, take up all the roots possible, which is best accomplished in showery weather. Planting in drills or little trenches cut with a spade, is preferable to using a dibber, the roots being easily spread out without injury. The bulb should not go far below the ground-level, and the soil should be made firm about them. Any of the Spanish type will stand ordinary winters well in this country, and as they will keep longer than the Tripoli, they are preferable, excepting it may be the Queen, which turns in earlier than any other kind.

FRENCH BEANS.—This crop must now receive attention, for the nights are getting colder, and we may soon expect frost, and protecting material should be handy. The late sowings should have the lights put on the frames at night, but these should be taken off by day. All pods of Kidney Beans should be gathered as soon as large enough for use; if not

wanted, preserve them in brine for the winter. Gather plants with ripe seed, and store them away in a dry place, till thoroughly hard, when the Beans may be shelled.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

APPLE AND PEAR TREES.—*Bushea* and pyramids which have made insufficient growth to warrant the pruning of them early in the month of July, as was recommended for trees carrying light crops of fruit, but were making strong growth, may now have all secondary growths pruned back to two or three leaves at the base, but leaving unpruned the extremities of branches till the crop is gathered. This present pruning, whilst effecting good by exposing the fruit to sunlight, admits light and air more fully to the inner parts of the plant, and assists thereby to mature the wood. Trees on walls and espaliers may have all the side-shoots cut back in the same manner; and where small shoots are in great numbers, many of these may be entirely removed, which will have the effect of reducing the number of fruit-bearing spurs, the crowding of these being also an evil.

PREPARING NEW STATIONS FOR WALL TREES.

—The preparation of borders, if time will permit, may be taken in hand, an operation always called for if the border is an old one, trees never growing satisfactorily in practically worn-out soil. Doing this kind of work in these long days, whilst the weather is dry, lessens the labour of getting-in materials, and expedites the work. In most gardens, a variety of soils is kept in stock, so that the work need not wait for turf to be cut, carted, &c. For stone fruits, it is advisable in land not resting on chalk or green sand, to put old mortar-rubble, plaster, or chalk in considerable quantities with the soil used; and likewise to form the drainage for the various tree-stations, if the land requires artificial drainage. With naturally light or gravelly soils, mix retentive loam, or some clayey kind of soil, or even marl, with the staple; but if the land is the reverse of light, more chalk may be used. For Pears, chalk or old mortar are not really so essential. Stiff and retentive, i.e., cold soils, are improved by using chalk or mortar-rubble in the bottom of the border, as in such soils the more thorough the drainage, the warmer is the border. Charred garden-refuse should not fail to be freely used in the compost, especially in heavy soils, as this substance keeps them porous and sweet. If the staple is considered to be good enough, simply take some top spit soil from another part of the garden, and away from fruit-trees, and mix this with burnt-refuse, &c., for planting in. If a few isolated trees are to be planted, the prepared sites may be 8 feet long by 4 feet wide, and 2 feet deep.

GATHERING PEARS.—The bulk of Louise Bonne of Jersey Pears on wall-trees should now be gathered; and to prolong the season of this fine Pear, a portion of the crop should be placed in shallow boxes, and kept in a cold place—the ice-house, for instance, or an underground cellar; but putting fruits into warmth for a day or two before consuming them. *Fondante d'Automne*, and *Beurré Hardy*, the latter an excellent variety, will require to be gathered not all at once, but from time to time. These varieties, if properly stored, can be made to last till *Marie Louise* and *Doyenné du Comice* come in.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

POTTING AND SURFACE-DRESSING VANDAS.—Having finished the potting and surface-dressing of the *Odontoglossums*, *Masdevallias*, &c., of the cool house, and the cleaning of the house itself, the plants should be neatly arranged for the winter. This work ended, I usually take the *Vandas* in hand, and repot or surface-dress them. The *Vandas* chiefly grown at this place belong to the tricolor section, and when I speak of potting, I mean plants which have lost a number of their leaves during the summer, causing the plants to have a lanky appearance. If the stems of such plants have been carefully syringed, fresh roots will have been emitted, and the stems may be lowered in the pots with safety in September, there being no strong sunshine. The cause to which I attribute the loss of leaves on *Vandas* is too much sunlight. Some of our plants lost many pairs of leaves at the flowering time, and doubtless permitting the flower-spikes to remain on the plants for long

periods of time, is not good for the plants, and certainly it causes the leaves to shrivel to a greater extent than when the spikes are removed early. Twisting the leaves by an unpractised hand when sponging them, as a novice is apt to do, causes them to split down the middle, a fact that he may not notice, and these leaves are the first to turn yellow and fall off. In potting, remove the old living sphagnum first, and wash it, ready for mixing with the new material; then remove the rest carefully, lift the plant out of its pot, and, having clean pots and crocks ready for use, transfer it to the fresh pot without delay, putting it as low down as possible, filling in with clean crocks and charcoal in about equal parts, and finishing the surface off with a layer about 3 inches, of sphagnum moss, small lumps of good peat, and a good sprinkling of finely-broken crocks and charcoal, the whole forming a neat round mound a little higher than the rim of the pot. The plants must be shaded from the sun at all times until rooting recommences, and watering must be done with care. The water afforded after the re-potting, if it be thorough, will be quite enough, as the necessary syringing that the lower parts of the stems get will keep the materials moist. Damp well between the pots. Our *Vandas* grow at the cool end of the stove, where at present the temperature is 70°, but during the winter months 60° or less. The bottom ventilators of this house are at present open day and night.

THE FLOWER GARDEN.

By T. H. CRASP.

THE PROPAGATION OF BEDDING PLANTS.—Every effort should be made to raise the required number of bedding plants of all kinds that are struck at this season in view of next year's requirements. Before doing so, notes should be made of intended alterations in the filling of the beds, and plants raised accordingly. Zonal Pelargoniums have done remarkably well this year, at the same time shoots fit for making cuttings will not be over plentiful, but if they are fewer in number they will be firmer than in usual years, and therefore more certain to make plenty of roots. No time should be lost in obtaining cuttings, or the plants will not be established before the winter arrives. The same remarks will apply to all such plants as *Verbena*, *Ageratum*, *Heliotrope*, *Coleus*, *Alternanthera*, *Iresine*, and the like.

SUCCULENT PLANTS.—If the tips of the branches of *Mesembryanthemum cordifolium variegatum* are taken off and dibbled into well-drained pans or pots of sandy soil, and placed under glass in the full sunshine, they will readily root, the stock so raised affording a large number of cuttings in the spring, which may be struck in a little warmth; also the trailing or branching succulents, including several of the *Sempervivum*. *Kleinia repens* is also best when struck at this season, preference being given to short sturdy tips of shoots, and after they are trimmed they should be allowed to dry at the cut end before they are dibbled rather thickly into well-drained pans or pots, and placed in a sunny dry frame or brick pit. Cuttings of succulents require but little water during the winter.

TUBEROUS-ROOTED BEGONIAS are a valuable class of bedding plants, and with a mulching of manure and an occasional watering they have done well in spite of the drought. If it be thought desirable to increase the stock of any special variety of *Begonia*, it may now be done by striking cuttings after the usual mode pursued with zonal Pelargoniums. *Begonia* cuttings root very freely in the open ground at an earlier part of the season, but it is now too late to expect success. Dibble the cuttings into pots of sandy soil, and place them in a cold frame, affording just sufficient water to prevent shrivelling; no more, or they will decay. Any flowering shoot may be made into a cutting, and this will not decay till a bulb has formed at its base. The cuttings should remain in the cutting-pots till the spring, wintering them in a frame or greenhouse, from which frost is excluded; taking care that the soil does not get too dry.

ROSES.—Attend to the budded stocks, and loosen the ligatures round the buds that have started. Though it is best for Rose-buds to remain dormant till the spring, they will sometimes start into growth about this time. These young shoots should be encouraged to grow by cutting back all the side shoots of the stock, and by this means the shoot from the

bud will attain some consistency before the winter. Failing this, they are liable to be killed by frost.

PAMPAS GRASS.—If liquid manure be copiously applied to strong clumps of the above when the inflorescence is developing, great benefit is afforded. This season the Pampas Grass is sure to be very fine.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

PELARGONIUMS.—The double and single varieties of zonals for winter flowering which are growing in pots, plunged in coal-ashes, &c., out-of-doors, should be placed under glass without delay, cleaning the plants and pots, and ascertaining that the drainage of the pots is perfect. The house in which these plants stand should be fully ventilated night and day for at least a fortnight. Watering will be much needed, and should receive close attention; and if clear soot-water be afforded once a week for a time, it will drive out any worms that may have got into the mould, besides improving the appearance of the plants. Avoid crowding, and let each plant have space, so that there is a free circulation of air round about it. A temperature of 50° to 60° by night and 60° to 75° by day will suffice at this season. The three most useful scarlet zonals are *Madame Raspail*, *John Gibbons*, *Henri Jacoby*; and for a white, *Improved Queen of the Belgians*.

PLANTS OF THE CONSERVATORY AND GREENHOUSE.

—Advantage should be taken at the present time, when many of the inmates of these houses growing in pots are standing out-of-doors, to prune, train, and clean the climbers in the houses. *Tacsonias* and *Passifloras* may now be pruned. These plants have grown vigorously, and the shoots should be thinned, so that plants standing beneath may get sufficient light during autumn and winter; but the short flowering shoots should be left, so as not to spoil the appearance of the plants for the present. *Jasminum grandiflorum*, *J. gracillimum*, and *J. pubescens* are climbers that are nearly past flowering, and these should be cleaned and the shoots left thinly. *Clianthus magnificus*, *Tecomas*, *Bignonias*, *Stauntonias*, *Cobaeas*, and *Clematides* should also have the shoots thinned and cut away from the glass, so as not to darken the houses. *Lapagerias*, *Plumbagos*, and *Bougainvillea glabra* are now at their best, and should not be much interfered with. When the plants are cleaned overhead, the borders should be slightly stirred with a steel fork, and top-dressed with fresh soil. *Camellias* and *Nerium Oleander* should also be put in order, and cleared of scale. To prevent the spread of the injurious and troublesome white and brown scale, afford weekly syringings of an insecticide.

ROSES.—Teas and climbing Roses, such as *Reve d'Or*, *William A. Richardson*, *Celine Forestier*, and *Cheahunt Hybrid*, which are all strong growers, may be well thinned out, leaving the leading shoots intact, but take away the weak flowerless wood; and thoroughly clean the plants. The Rose borders should be afforded a top-dressing of rich loam and fresh horse-droppings. The glass, staging, tables, floors, and walls should be made clean, and everything got in readiness for bringing in the plants shortly; the middle of the month is quite late enough, especially in the northern counties, to leave out-of-doors the more tender plants.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

VINES.—Grapes which will have to be kept in good condition till the month of April or later, should by this date, or soon afterwards, be well-coloured, and by the end of the present month afforded a cool, dry, atmosphere. The varieties *Lady Downe's Seedling* and *Black Alicante* require to finish them the use of fireheat and free ventilation for a long time after the fruit has taken on its proper colour, so as to prepare it for better keeping in bottles of water. Grapes ripened late are liable to shrivel, and all Grapes should be quite ripe by the end of this month. Unmatured canes should be kept entirely free from lateral growths, and strong warmth used in the pipes, with a free circulation both front and top of the vinery. If the summer mulching has not been removed from Vine borders, no delay should occur in removing it, so that the sun's heat may have full access to the soil, and if the surface-soil be close and wet, a portion of it

should be removed and replaced with fresh soil, but take care to expose no roots to the air in doing this. The surface of all borders should be kept loose, with a fine crumb to prevent fissuring. In deep borders, or those which are flatish, drills should be drawn from the vinery wall to the front of the border to carry off heavy rain. Such borders require careful management as compared with borders that are high and dry.

FIGS.—Late crops are forwarder than usual this season, and liberal waterings, where the roots are in well-drained soil, should be afforded. The present time is very suitable to root-prune unfruitful trees, going underneath the stems of the trees from both sides, and cutting off the tap roots. This done, ram some lime-rubbish firmly underneath the newly-cut roots, which, if it be used with crushed bones, will keep the new roots in their places, and afford nourishment. If it is seen that this is not a sufficient check, some of the main roots should be searched for, and carefully lifted, cutting-back those which are fibreless, and replanting them firmly into chalky loam or soil, mixed with lime-rubbish, and this should be firmly rammed round about the ball or mass. When they are embedded in this, they will take liquid manure, without stint, at the growing season, and not become gross-growing; but short-jointed shoots will form, which are always fruitful, and the fruit grown under such conditions is large and good. Figs growing in pots or tubs require more skill in fruiting them than trees in the open ground, and it should be remembered that a free drainage and healthy foliage up to the end of the season are points which conduce to fruitfulness. Dwarf standarda grown in confined space, with their roots surrounded by walls, are very manageable for early forcing, but pot-culture, where the roots can be allowed to ramify into rich soil, and be liberally treated, is the more popular method for early forcing of the Fig, and purchasers may find *St. John's*, *Brown Turkey*, and *White Marseilles*, varieties of the finest flavour, and very productive, and if space is limited, they are invaluable.

THE APIARY.

By EXPERT.

AUTUMN-FEEDING OF BEES.—All stocks which do not possess stores of from 20 to 25 lb. should be fed with thick syrup to make them up to that weight, for as the day and night temperatures get lower, it makes the task of storing and sealing syrup more difficult for the bees to accomplish. In calculating the amount of food in a hive, it is well to bear in mind that a standard frame will contain about 5 lb., so that at least four frames full of stores will be necessary to carry a stock safely through the winter and spring till honey-collecting begins again. Better than feeding up in autumn is the plan of leaving the honey in the brood-chamber intact, and it will generally be found that the bees will have stored enough below the supers to take them through the winter. If this plan is carried out, it will be found that the bees will come out much stronger the following spring through the saving of labour required to store syrup in place of the honey taken away from the hives. Syrup for autumn-feeding is generally made by adding 5 lb. of loaf or granulated sugar to 1 quart of water which has been brought to the boil. Keep stirring, to prevent it getting burnt, and by the time it has come to the boil again it will be done; a couple of tablespoonfuls of vinegar may be added to prevent crystallisation. Where a good many hives have to be fed up, the boiling of syrup is rather a troublesome undertaking, and bee-keepers in a large way make their syrup by simply dissolving the sugar in boiling water. For this purpose, the cylinder of a honey-extractor or a honey-ripener will be found very useful to make the syrup in, and it can be afterwards drawn off through the valve at the bottom, and taken round to the hives without spilling any about. Great care should be taken while making the syrup not to attract any bees, for if they once detect the smell they will at this time of year come after it by thousands, and besides causing a great nuisance by their persistent efforts to get it, many of them will be lost or killed. The food required for each stock should be given in one dose, and for this purpose a feeder that will hold 20 lb. of syrup should be used. The proper time to put the feeder on is in the evening, as it causes great excitement, which will have subsided by the following morning, and robbing not so likely to be started.

EDITORIAL NOTICES.

ILLUSTRATIONS.—Photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c., are particularly solicited; but the Editor cannot be responsible for loss or injury.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, SEPT. 12 Royal Horticultural Society: Floral and Fruit Committees, at the Drill Hall, James Street, Westminster; a Lecture will be given by Mr. J. Douglas on "Garden Varieties of Penstemon and Phloxes."

WEDNESDAY, SEPT. 13—Fast Anglian Horticultural Club.

SHOWS.

TUESDAY, SEPT. 12 Show of Phloxes and Penstemons, at the Drill Hall, James Street, Westminster.

WEDNESDAY, SEPT. 13 Show of Dahlias and Autumn Flowers, at the Gardening and Forestry Exhibition, Earl's Court (two days).
Royal Caledonian Horticultural Society (two days).

SALES.

MONDAY, SEPT. 11 Great Annual Trade Sale of Store and Greenhouse Plants at Dyson's Lane Nurseries, Upper Edmonton, by order of Mr. H. B. May, by Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.

TUESDAY, SEPT. 12 Great Annual Trade Sale of Winter-blooming Heaths at the Burnt Ash Lane Nurseries, Lee, S.E., by order of Messrs. B. Maller & Sons, by Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.
Orchids from Messrs. Linden, Brussels, at Protheroe & Morris' Rooms.

WEDNESDAY, SEPT. 13 Annual Trade Sale of Winter-flowering and other Plants at the Lea Bridge Nurseries, Lea Bridge Road, Leyton, Essex, by order of Mr. John Fraser, by Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.

THURSDAY, SEPT. 14 Annual Trade Sale of Store and Greenhouse Plants, at the Brimsdown Nurseries, Enfield Highway, by order of Mr. John Maller, by Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.
Enormous Consignment of 48,000 Bulbs of Lillium Harrisii and other Lilies, for unreserved Sale, at Protheroe & Morris' Rooms.

FRIDAY, SEPT. 15 Great Annual Trade Sale of Winter-blooming Heaths, at the Longlands Nursery, Sidecup, S.E., by order of Messrs. Gregory & Evans, by Protheroe & Morris.
Dutch Bulbs, at Protheroe & Morris' Rooms.
Orchids, from Mr. F. Sander, at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 16 Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—58° 3.

THE publication of the first part of this Index is an important event for botany and horticulture.

We have from time to time made our readers acquainted with the nature and the progress of this colossal undertaking. It must suffice, then, now to say that the work owes its origin to the late CHARLES DARWIN, who notified to his friend, SIR JOSEPH HOOKER, his intention to devote a considerable sum in aid or furtherance

of some work of utility to biological science. The difficulties he had experienced in accurately designating the many plants which he had studied, and in ascertaining their native countries, had suggested to him the compilation of an Index to the names of all known flowering plants, together with the names of the botanists by whom they were conferred, reference to the books in which they had been published, and an indication of the country in which the plants are indigenous. Mr. DARWIN rightly considered such a work as one "of supreme importance to students of systematic and geographical botany, and to horticulturists."

The nature of the book, the first instalment of which is now before us, is sufficiently indicated in this brief sketch of its history. The bulk of the work has been done by that born index-maker, Mr. DAYDON JACKSON, one of the secretaries of the Linnean Society, with the aid of a clerical staff and the co-operation of the officers of the Kew Herbarium, the whole work being supervised and directed by Sir JOSEPH HOOKER, whose supervision has been very far from nominal.

The method adopted has been to search for the original descriptions and names of plants in all and every accessible publication, "from the time of LINNÆUS [a rather vague limitation] up to and including 1885." In this manner, not only all strictly botanical publications more or less well known to students have been searched, but books of travel, biographies, incidental memoirs have been ransacked for casual names and references, and the names recorded even when they were names and nothing more. When the work is finished, it will be interesting to know how many thousands of separate publications have been scrutinised by Mr. JACKSON. Indeed, the statistics of the book will be of great interest, but we shall be well content to leave these, as also some more or less indispensable explanations, till the index is complete, the more so as, doubtless, various matters requiring explanation will crop up during the passage of the remainder of the work through the press, and these can all be dealt with at the end.

What we have actually before us is the alphabetical record (compiled as above explained) as far as the beginning of "Dendrobium," that is, from "Aa" to "Dendrobium exiguum." This suggests the criticism that it is unfortunate the first volume should end in the beginning of a genus, leaving the remainder of that genus to head the second volume.

The number of quarto pages is 728, each with three columns of 80 or more lines apiece. The number of names of all sorts in a column is, approximately 50, or 150 to a page, so that we shall not be far wrong when we say that the present part contains upwards of 43,000 names, each of which has had to be hunted up, recorded, verified, and many of them corrected, or referred to their proper station. These details amply justify the epithet colossal, which we applied to the work. From its alphabetical arrangement it is clear that the printing could not have been begun until the manuscript was complete, and so we may hope that the remainder of the work will pass through the press as rapidly as the careful scrutiny of compiler, editor, and "reader" will permit.

The accepted names of the genera are printed in black-faced type, the designations of the species in ordinary Roman type, the references in italics. For the synonyma the names are in italics, the references in Roman. But it is not necessary to run the risk of wearying the reader with such details. Of more importance is it to

know the principles upon which the selection of some names as correct, and the relegation of others to the rank of synonyms have been effected. It is not to be supposed that even Sir JOSEPH HOOKER has a monographer's knowledge of more than an infinitesimal fraction of the names that have passed under his eye. It is only a monographer who can deal properly with such questions—we ought to say some monographers, for, unfortunately, it does not follow, because a botanist has compiled a monograph, that it is a good and trustworthy one.

Personal knowledge and judgment being then obviously inadequate to deal with every item of so vast a record, selection must have taken place, and an enunciation of the principles governing that selection, is one of the things that will have to be recorded when the work is complete. We are disposed to regret that they were not sketched out in the introduction to the present volume. The expert systematist can, of course, determine these points for himself by an examination of the text, but it is not given to everyone to be a systematist, and naturalists of the coming school care little for these things. The matter is of the more consequence, in view of the interminable discussions on nomenclature which occupy the time of congresses, and fill the pages of books.

It seems that the coming race of botanists is not content to adhere to the old conventional rules, based on the teaching of such law-givers and practical workers as LINNÆUS and the two DE CANDOLLES, but they must have a new convention of their own. There would be no possible objection to this if they could confine its use to themselves; a convention is but a convention, it is but a means to an end, but such a thing cannot be thus limited in its application. Should the neo-nomenclature party eventually gain the day (as it seems likely they may do in America), a worse than Babylonian confusion will arise in some cases, and the time of botanists will be taken up, to a greater degree than at present, in the wearisome and unprofitable task of unravelling the synonymy and in the adjustment of the new to the old.

From this point of view the publication of the Kew Index is most important. The time of congresses may be occupied with lengthy discussions. Neat codes and formulas may be drawn up, to be rediscussed by dissentients at the next meeting; but meanwhile, there will be the *Index Kewensis* and the *Genera Plantarum*, accomplished facts, drawn up on principles which every working botanist in this country appreciates. They may not be perfect, but we shall have to wait a very long while before our American friends or Dr. OTTO KUNZE give us more perfect ones. And so we venture to think the working botanists of the future will, in the main, follow the guidance of the *Genera Plantarum* and of the *Index Kewensis*, and leave others to do the talking. Of course, in purely scientific matters—such as the perfecting of the "natural system," as apart from mere conventional expediency—there will not be, and ought not to be, any adjuration in the words of the masters, as finality and uniformity of practice are unattainable. But these are big matters to bring up at the end of an article—we felt under some obligation to make mention of them, but it is not incumbent on us to discuss them at length. We can only act as the representatives of that increasing body of horticulturists who not only admire, but want to know something about the plants they grow, by testifying to the enormous value of the Kew Index for the purposes of the student, by expressing our admiration of the patience, judgment, and labour involved in its preparation, and by tendering our deep gratitude to its compilers.

* *Index Kewensis*: an Enumeration of the Genera and Species of Flowering Plants, from the time of LINNÆUS to the year 1885, inclusive, together with their authors' names, the works in which they were first published, their native countries, and their synonyma. Compiled at the expense of the late CHARLES ROBERT DARWIN, under the direction of JOSEPH D. HOOKER, by B. DAYDON JACKSON. Part I. (Oxford: at the Clarendon Press, 1892. London: H. FROWDE, Amen Corner.)

FIG. 52.—NEWER BUILDING AND THE ANCIENT KEEP. (SEE P. 295.)

CARDIFF CASTLE.—The accompanying views illustrate the article on this interesting building, its gardens, and vineyards, which will be found on p. 295.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Society will be held on Tuesday, September 12, in the Drill Hall, James Street, Victoria Street, Westminster, and on this occasion Mr. JAS. DOUGLAS will deliver a lecture on "Garden Phloxes and Pentstemons." Collections of these plants will be welcomed by way of illustration. As the season for *Gladiolus* flowers is drawing to a close, we have been requested by Messrs. KELWAY & SON, of Langport, to say that their prize of a Silver Medal will be offered at this meeting for the best twelve *Gladiolus Gandavensis* varieties raised from British seeds. Prizes are also offered by the Society for twelve distinct *Gladiolus* grown by amateurs.

THE ROYAL HORTICULTURAL SOCIETY'S ISLINGTON SHOW.—It is due to Messrs. MACARTHUR, 4, Maida Vale, London, W., to rectify an omission in our report of the above in our last issue, of all mention of his exhibit of Palms, &c.; the more so, as in it was the only Fan Palm in the Hall and one other, both very fine specimens. The rest of the group consisted of various Orchids—*Oacidium crispum*, *Cypripedium Harrisianum superbum*, *Miltonia lineata*; small plants of *Croton*, *Dracæna*, Ferns, and *Pandanus*.

NATIONAL CHRYSANTHEMUM SOCIETY.—A meeting of the general committee took place on the 4th inst., at Anderton's Hotel, Fleet Street, Mr. C. HARMAN PAYNE in the chair. The chairman, as the foreign corresponding secretary, reported that he had received a communication from the Bordeaux Chrysanthemum Society, stating that an exhibition would be held there on November 11 to 19, and

inviting English growers to compete. Also from Mr. JOHN EARLAND, Christchurch, New Zealand, acknowledging the receipt of the frozen flowers sent out from Edgland last winter, and stating that the Christchurch growers were not far behind the home growers in the production of fine Japanese blooms; and in order to test the matter, Mr. EARLAND suggested that the Society offer a medal open to all societies or growers in the Australasian colonies, for six Japanese and six incurved varieties shown in two square blocks of ice, in the same way as the English flowers were frozen, each competitor to

deliver his exhibit at the place of judging at his own expense. This suggestion was referred to the schedule sub-committee to be dealt with as soon as possible after their appointment in the autumn. The Hon. Secretary made a report as to the reserve fund, and also as to the amount received since the commencement of the present financial year. Mr. E. MOLYNEUX was elected a member of the Floral Committee in the place of Mr. E. SANDERSON, resigned. It was resolved that Mr. CHARLES E. PEARSON be invited to read a paper before the committee at one of its meetings in October, dealing

with suggestions for the schedule; and later on, Mr. SHEA, on the methods of judging Chrysanthemums. Ten ordinary members and one Fellow were elected. The Secretary was instructed to convey to Sir JOHN LLEWELYN, Bart., one of the Vice-Presidents of the Society, and Lady LLEWELYN, the sympathy of the committee under the great loss they had sustained in the recent melancholy death of their son through an accident. The usual vote of thanks to the chairman closed the proceedings.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.—The Council of this Society are endeavouring to promote the making of home-made wines and preserves of all kinds, by offering at the autumn show of the Society, at Edinburgh, a series of Medals for the finest home-made wine from any fruit or flower. Medals are also offered for the best exhibits of cider and perry; and for all manner of jams, jellies, bottled and dried fruit, and every other description of "preserves." It is expected that a good display will be made of these articles at the show on the 13th inst., which promises to be one of the finest exhibitions of fruit the Society has held for many years.

M. EDOUARD ANDRÉ.—We desire to express our congratulations to our eminent friend on the occasion of his appointment as Chevalier of the Order of Leopold. M. ANDRÉ has many claims to a distinction of this kind; he is a landscape gardener, whose talent has been exercised not only in France, but at Sefton Park Liverpool, and in South America. He is a traveller and a botanist who has collected, published, and distributed numerous plants of value and interest; he is a Professor in the National School of Horticulture at Versailles, and one of the Editors of the *Revue Horticole*, and the author of a standard treatise on landscape-gardening.

M. CHARLES BALTET.—The National Horticultural Society of France has recently awarded the prize "Jobert de l'Hyberderie" to M. CHARLES BALTET, for his MS. essay on the horticulture of the five parts of the world. The prize is one of 10,000 francs (£400). *Revue de l'Horticulture Belge*.

PRESENTATION AT ALDENHAM PARK GARDENS.—On Friday, the 1st inst., Mr. J. A. Cox, who has served in the capacity of Foreman for nearly ten years, was presented with a testimonial by his friends and fellow-workmen. The testimonial took the form of a marble clock suitably inscribed, a set of carvers, and a dozen knives and forks. Mr. E. BECKETT, on behalf of the subscribers, made a few kindly remarks and expressions of goodwill, and spoke of the satisfactory way in which Mr. Cox had fulfilled his duties, and the high esteem in which he was held.

SEPTEMBER HORTICULTURAL MEETING AT GHENT.—Certificates of Merit were awarded (par acclamation) to:—M. Jules Ilye, for *Cypripedium triumphans*, an excellent hybrid from *C. oenanthum superbum* × *Sallieri Hyeannum*, and which we will describe fully later on; to the Société Louis van Houtte père, for *Sonerila Madame Léon Say*, a valuable acquisition to be described later on. Certificates of Merit were allotted to:—M. Guill. Ghysalincq, for a seedling *Rhododendron*, the leaves of which are marked down the centre with a very broad band of golden-yellow; to the same exhibitor for *Dracæna indivisa Veitchii* (a seedling from that variety), a valuable novelty; to the Société Horticole Ste. Dorothée, for *Echmea Weibachii aureo-striata*, a pretty variety; to M. V. Coppenolle, for *Dracæna Van Coppenolleana*, a seedling from *australis* (1892), but the variegation is reversed, the yellow, instead of being in the centre of the leaf, is at the edges—this is a decided acquisition; to MM. Duriez Frères, for *Adiantum cuneatum* fol. var. (Certificate par rappel); to M. H. Schmitz, for an *Encholirion*, introduced from Brazil—a capital plant, very decorative, and worth further consideration; to M. Jules Ilye, for *Miltonia Moreliana superba* (Certificate à l'unanimité), the flower unusually dark, the divisions of considerable width—the plant well grown; to the same exhibitor, for *Cypripedium giganteum*, a hybrid

from *Harrisianum* × *Sallieri Hyeannum*, and noticeable for the size of the flower, and especially of the lip. A collection of cut flowers of *Gladiolus*, containing some excellent specimens, was sent by M. Henno-Delbosse, of Tournai; and *Sonerilas Madame Blommaert* and Prof. Ch. de Bosschère (both valuable acquisitions), by the Société Louis van Houtte père. Certificates for Cultivation and Blooming were allotted to M. Guill. De Saegher, for a lot of *Cuphea platycentra* aur. var., charming specimens on a stem measuring from about 10 to 19 inches long, the foliage variegated and flowers abundant; and to M. Ameys, for *Saxifraga sarmentosa*, a plant with large leaves of very decided colouring. *Ch. D. B.*

ACREAGE OF HOPS FOR THE LAST THREE YEARS.—According to the returns issued by the Board of Agriculture, the acreage under Hops in England, as returned upon the 4th of June in the years 1891 and 1892, and on the 5th of June in the year 1893:—

COUNTIES.	1891.	1892.	1893.
	Acres.	Acres.	Acres.
Berks	11	10	11
Gloucester	25	39	33
Hants	2,749	2,775	2,795
Hereford	6,580	6,797	7,079
Kent	34,266	34,058	34,815
Notts	14	14	12
Salop	112	117	123
Suffolk	20	18	21
Surrey	1,955	1,938	1,845
Sussex	7,150	7,124	7,325
Worcester	3,280	3,369	3,516
Total	56,112	56,259	57,576

HARDY PERENNIALS.—Messrs. JOHN LAING & SONS send us a boxful of cut perennials, which show how effective and interesting these plants are. It is impossible, and, indeed, it is not necessary, to enumerate them all, but we may pick out the following:—

Michaelmas Daisies, &c.—*Aster William Bowman*, a form of *A. novi-belgii*, with deep rosy-lilac narrow rays and orange disc. *Aster umbellatus*, flower-heads whitish, small, in moderately compact wedge-shaped corymbs; good for cutting. *Aster novi-belgii versicolor*; remarkable for its linear leaves, and dense many-flowered clusters of flower-heads, some white, others lilac; useful for cutting.

Sunflowers and other Composites.—*Helenium pumilum*, with glabrous sessile leaves, and heads of yellow flowers on long stalks; the ray-florets are broadly wedge-shaped, 3 and 4-toothed; one of the best of the dwarfier kinds. *Helenium grandicephalum striatum*: this is a form highly to be recommended for its rich brown orange ray-florets, streaked with yellow; it is one of the most attractive of its class. *Silphium conatum*, one of the taller-growing kinds, very effective in front of shrubs. *Helianthus multiflorus*, Soleil d'Or, one of the best varieties of this old species; *H. multiflorus Bouquet d'Or*; *H. multiflorus plenus*; *H. rigidus*, a puzzling species, of which there are numerous ill-defined forms. *Heliopsis patulus*. *Rudbeckia californica*, a tall-growing, loosely-branched kind, with glabrous lanceolate leaves, and large flower-heads of clear yellow, on long, erect stalks. *Coreopsis grandiflora*; *Gaillardia grandiflora* in variety, very brilliantly coloured; *Achillea millefolium roseum*, useful for its rosy colour. *Chrysanthemum latifolium*, *C. maximum* (both white).

Miscellaneous.—*Epilobium rosmarinifolium*, with linear leaves and pink flowers; *Gypsophila repens*, of dwarf habit than *G. paniculata*, and consequently more useful in small gardens, where space is a consideration; *Saponaria officinalis*, the double-flowered form, with very fragrant flowers; *Lobelia splendens*, Rose Queen, a very richly-coloured form. Pentstemons have always been a specialty with Messrs. LAING, and the specimens they send us show that

in brilliancy of colouring these plants have this year surpassed themselves. *Sedum Ewerii*, a low-growing, prostrate under-shrub, with small, opposite, sessile, rounded, glaucous leaves, and dense panicles of pink flowers.—Messrs. VERTEGANS send *Bocconia japonica*, similar to *B. cordata*, but with larger, more boldly-divided leaves, not quite palmately nor quite pinnately, but somewhat intermediately lobed, the lobes themselves blunt and sinuate; the under-surface is creamy-white; the inflorescence is like that of the commoner species.

FLOWER SHOW REPORTS RECEIVED.—St. Andrew's Horticultural, August 24, Morebattle, Hawick, Roslin, Liberton, Carrie, Chryston, Cadder, Lennoxton, Abercorn, Muckart, Alloa, Alva, Muthill, Banchory, Innerleithen, Jedburgh, Bridge of Earn, Balfron, Torphichen, Newton Grange, Arniaton, Bonnyrigg, Pathhead Ford, Bearton, Grangemouth, Markinch, Alyth, Uddingstone, Stow, Kirkpatrick, Muirkirk, Craigs, Upperkeith, Malling, Rocester, Shepherdwell, Ambergate, Eckington, Birchover, Marsden Moor, Ellesmere Port, Ayr, Lindfield, Cheshire Agricultural, Rothbury, and Ruthin.

ARTIFICIAL EDELWEISS.—In the current number of the *Journal of Botany*, Mr. F. N. WILLIAMS, the monographer of *Dianthus*, confirms the statement of the production of artificial Edelweiss from grey cloth, as stated in a previous number. For some reasons we should be glad if other plants could be equally well counterfeited. The manner in which Ferns are uprooted for sale, mostly for people who could not distinguish between Parsley and Parsley-Fern, makes one wish some artificial Fern could be fabricated to ensure the safety of the genuine article.

PRICES OF HOME-GROWN TIMBER IN BEDFORDSHIRE.—Mr. A. D. WEBSTER reports that the following prices were realised for home-grown timber of fair quality at the recent auction sale on the Woburn estate:—Oak, 1s. 6d. per foot; Ash, 1s. 6½d.; Elm, 8½d.; Spanish Chestnut, 11d.; Poplar, 10½d.; Willow, 11d.; Maple, 11½d.; Larch, 1s. 1d.; Beech, 9d.; Lime, 10d.; Sundry poles and tops, 1s.

A NEW GREEN PIGMENT IN PLANTS.—Mr. D. HOOPER, of The Laboratory, Ootacamund, writes as follows:—"In the issue of the *Gardeners' Chronicle* for July 22, notice is made of a discovery by Professor TSCHIRCH of a new green colouring matter in *Trichosanthes pubera*, which he has named trichosanthin. I should like to point out that the green colouring matter of the pulp of some of these plants was isolated by me in 1889, and the colouring principle of *Trichosanthes palmata* was specially investigated spectroscopically by Mr. MICHE SMITH, of Madras, who read a paper on the subject before the Royal Society of Edinburgh in 1890. An account of these plants, their chemical composition, and a comparison of the spectrum of the colouring matter with that of chlorophyll, may be found in *Pharmacographia Indica*, vol. ii., pp. 70-74. It will be seen that the term 'trichosanthin' was applied by me, not to the pigment, but to the bitter glucoside, the active principle of the plant."

MR. J. M. HENRY.—We are informed that Mr. HENRY, for the last fourteen years Superintendent of the Baroda State Gardens, the last five of which he has carried on the double duties of Superintendent of Gardens and executive officer for Mr. W. GOLDRING of Kew in his work of laying-out new gardens, and re-modelling old ones, has now been transferred wholly to the landscape department, and will devote the whole of his time to that work, under the able direction of that gentleman, who remains in England for eighteen months before returning to India to carry out the many new parks and pleasure-grounds H.H. the GAERWAR contemplates making throughout his extensive territory for his people.

LOCAL RATES.—The Board of Agriculture has circulated a leaflet containing some information as to the method of procedure to be adopted by occupiers

of land who may seek to obtain a reduction of their assessment to the poor-rate and other local rates, on the ground that their premises have been valued at too high a figure, or the valuation maintained at a level above the actual value. Outside of London the basis for the assessment of the poor-rate, and practically of every other local rate levied under the general law, is the valuation-list made under the Union Assessment Acts. There are only thirteen places in England and Wales, outside London, where the Union Assessment Acts are not in force.

1. *As to the Poor rate.*—The poor-rate is assessed upon the net annual or rateable value of premises, as fixed by the valuation-list.

2. *As to Rates other than the Poor-rate.*—The principal rates other than the poor-rate which are levied under the general law are the borough-rate, the county-rate, the highway-rate, the general district-rate, and certain rates levied for sanitary purposes in rural sanitary districts. All these rates are based practically on the valuation-list.

3. *Special Assessments of Land not occupied by Buildings.*—In the case of three of the rates mentioned in Part 2 of the memorandum, the law provides for the assessment of land not covered by buildings, at a less rate than property consisting of buildings, &c. These three rates are the general district-rate in an urban sanitary district, a separate rate for special sanitary expenses in a rural sanitary district, and the lighting-rate. Occupiers of land used as arable, meadow, or pasture ground only, or as woodlands, allotments, orchards, market-gardens, or nursery grounds, are assessable to a general district-rate in respect of such land in the proportion of one-fourth part only of the rateable value according to the valuation-list; and in the case of a separate rate for special sanitary expenses, they are, according to circumstances, either to be assessed in respect of one-fourth part only of the rateable value of the land, or are to pay in respect of it one-fourth part only of the rate in the pound payable in respect of houses and other property. Occupiers of houses, buildings, and property (other than land), are required to pay, in respect of their assessment to the lighting-rate, a sum in the pound three times that paid by occupiers of land; so that if the rate on other property is 6*d.* in the pound, occupiers of land have to pay only 2*d.* in the pound. Failure, in rating such occupiers, to allow the partial exemption for which the Acts provide, would be a good ground of appeal against any of the three rates above mentioned.

REV. LEONARD BLOMEFIELD.—The death, on the 1st inst., at the advanced age of ninety, of this eminent naturalist, is announced. Mr. BLOMEFIELD was better known to a former generation of naturalists as LEONARD JENYNS, he having assumed the name BLOMEFIELD at a later period. So long ago as 1835 his *Manual of British Vertebrate Animals* was published at the Cambridge Press—a book which long enjoyed the high consideration of naturalists, and which, even now, is not obsolete. The descriptions are excellent, the arrangement lucid, and the notes instructive. Compared with the rambling dissertations which some naturalists now indulge in, the clearly-defined, well-ordered statements make one wonder whether science has really so greatly advanced since the early part of the century; its methodical presentation in many cases certainly has not done so. Mr. BLOMEFIELD was chiefly known as a zoologist, and was a frequent contributor to LONDON'S *Magazine of Natural History*. Mr. JENYNS edited an issue of WHITE'S *Selborne*, and, inspired by that work, he published some *Observations on Natural History*, and on *Meteorology*. To our own columns, LEONARD JENYNS was an occasional contributor in bygone days; indeed, only a few years have elapsed since he wrote in these columns on the outgrowths from trees, generally known as burra. In 1862 he published a sympathetic memoir of his friend and kinsman, the late Rev. Professor HENSLAW. Of late years, Mr. BLOMEFIELD resided at Bath, where he continued to take much interest in local natural history. Mr. BLOMEFIELD was elected a Fellow of the Linnean Society so far back as 1822, so that he

was the "father of the Society," and in that capacity an address of congratulation and sympathy was, a few years since, presented to him. It may be added that Mr. JENYNS, while a student at Cambridge, was offered the post of naturalist to the "Beagle," which was afterwards accepted by CHARLES DARWIN.

CAMPANULA EXCISA.—This is a rare alpine species, found on the Simplon, and distinguishable from its allies in the circumstance that each of the lobes of the corolla is narrow at the base, so that between each two of them there is a round aperture or sinus. The stem-leaves are linear, the calyx-lobes of similar form, ultimately reflexed; the corollas blue. Our illustration (fig. 53) is from a plant in the Royal Gardens, Kew.

FIG. 53.—CAMPANULA EXCISA.

ROYAL BOTANIC GARDEN, CALCUTTA.—The report for the year 1891—1892 shows that a steady advance has been made during the year in improving the garden, both as a scientific centre and as a pleasant resort for the public. At the commencement of the year the season was abnormally dry, and although this had the effect of destroying a number of Palms and other out-door plants, these losses were repaired to a great extent before the cold season began. The herbarium continues to receive special attention; more than 15,000 specimens were added to it during the year.

"The collections made by Mr. GAMMIE were the result of a botanical excursion to some of the less known parts of Independent Sikkim and of the Tibetan frontier, on which he was specially deputed with the sanction of Government. They contain many rare plants of much interest. Mr. GAMMIE was absent for four months. His first excursion extended through the Singalilah Range to its origin in Kinchinjunga. In the vicinity of Kinchinjunga itself Mr. GAMMIE was, on account of the great inclemency of the weather, able to remain only a few days. He next travelled across Sikkim to Tamloong, from whence he followed up the Tista to Chuogtam.

From thence Mr. GAMMIE explored the Lachung Valley as far as the Donkia La, which was the northern limit of his travels. He spent two months in forming collections in this valley, and then ascended to Thanka La, and also to Ghora La at the head of the Sebu valley, one of the few tracts in this region which Sir JOSEPH HOOKER was unable to visit during his sojourn in the Eastern Himalaya in 1849-50. From Lachung Mr. GAMMIE returned to Toomlong; and from thence he traversed the Chola range, visiting the Chola, Yak-la, and Zey-lap-la passes. He returned to the Cinchona plantation by the military road from Gnatong to the Tista bridge. Mr. PANTLING'S collections consisted exclusively of Orchids, of many of which he has prepared most admirable drawings, which it is hoped may some day be published. The collections from the Andamans were made by two Burmese, who have worked under the supervision of Mr. E. H. MAN, C.I.E., whose efforts to help in the exploration of these islands have been most disinterested and laborious. Native collectors were sent as usual to Assam and Burma."

NATIONAL ROSE SOCIETY.—The *Gardeners' Magazine* prints at length the questions recently put unofficially by Mr. GRAHAME, and a summary of the answers received. The questions were:—

1. Do you think the Annual Tea Rose Show at the London Scottish Drill Hall, Westminster [Royal Horticultural Society], advantageous or otherwise to the Society and its exhibitors, and would you maintain or abolish it?
2. (A) About what date do you consider best for our Annual Metropolitan Show?
(B) Do you think Saturday the best day on which to hold that meeting, or do you think the exact day of the week immaterial?
2. About what date do you consider best for the Provincial Show, bearing in view that this meeting should be fixed chiefly to suit growers in late districts?
4. (A) Do you think two Metropolitan Shows of equal importance would be preferable to the present arrangement of a Metropolitan and Provincial Show?
(B) Or if the arrangements for the two shows be left as they now are, would you divide the prize-money more equally?
5. Do you think it would be desirable that candidates for membership in our Society should go through a form of election?

In reply to question 1, the analysis of the replies gave a percentage of 49 in favour of the retention of an early Tea Rose Show, 35 per cent. wished to abolish it, and 16 per cent. were indifferent, but many of those in favour of the retention of such a show were also adverse to the present locality of the show, and in favour of a general early show in a southern locality.

QUESTION 2A.

End of June to July 3	41 per cent.
July 1 to 6	39 "
July 4 to 14	15 "

It will be seen at once that the majority is unmistakably in favour of comparatively early dates.

QUESTION 2B.

While bound to Crystal Palace, same date as now	46 per cent.
Saturday, worst day	33 "
Immaterial	21 "

QUESTION 3.

Mid July, or a fortnight after Metropolitan Show	79 per cent.
Indifferent	21 "

QUESTION 4A.

For two metropolitan shows	25 per cent.
Against	70 "
Indifferent	5 "

QUESTION 4B.

For more equal division	30 per cent.
For present division	67 "
Indifferent	3 "

QUESTION 5.

For election	41 per cent.
Against election	47 "
Indifferent	9 "

THE UNITED STATES FORESTRY DIVISION OF THE DEPARTMENT OF AGRICULTURE has, says the *Builder*, been making some experiments in order to ascertain the loss of strength and durability brought about by tapping Pine trees in order to obtain turpentine, &c., from them. It has been generally supposed that the boxing of the tree detracted from the virtues of the timber for constructive purposes, but the investigations of the department tend to negative this view. Both chemical and mechanical tests have been made with the same result as to the non-destructive effect of tapping or "bleeding." Over 300 tests on thirty-two Pine-trees from various localities were made; some of these

were boxed or "bled," and some were not; and it is a curious fact that the boxed timber showed a better average than that from which the turpentine had been taken. The superiority of the bled timber may, however, be accounted for by the fact that trees which are used for turpentine supply are generally placed in sites more favourably situated for their growth. It is, however, shown by the experiments, that the heart of the tree is not affected by the bleeding, the flow of resinous-matter being in the exterior sap portion of the trunk. It has long been known that bleeding of the tree retards its growth; and it would appear that this is its only effect in regard to its influence on the quality of the timber. It may be that this checking of the growth has a favourable result on the wood, as tending to the slow growing of the timber.

HOME CORRESPONDENCE.

THE AGRICULTURAL HALL SHOW.—Whilst opinions are conflicting as to the success or otherwise of the great Agricultural Hall Show, which the Royal Horticultural Society have so energetically promoted, I fear it will have to be conceded that much effort looked for was wanting through the absence of groups of flowering plants, which, had they been present, would have constituted a grand feature. In any case, all must admit that at present there is no place in London that gives such ample area, or in which such a splendid floral display could be held as does the Agricultural Hall. Horticulturists accustomed so much to the west side of London, find it hard to look favourably on the Hall, yet it is situated in one of the busiest and broadest thoroughfares in London, and in the midst of a marvellous population. Very likely the people of North London have to be accustomed to flower-shows, but they have been so accustomed to such sensational elements in the form of so-called entertainments, that flower-shows are doubtless rather slow in their estimation. It may be possible to correct that in time. To the many who love Chrysanthemums for their beauty, how delightful would be the change from the Westminster Aquarium, with all its noise, rattle, and dust, to the quietude and enjoyableness of the Agricultural Hall, for the National Society's Chrysanthemum shows. On the other hand, to the greater many, the noise, rattle, and sensationally dangerous "amusements" (heaven save the mark!) constitute the chief attractions at the Chrysanthemum shows. Again, were these shows transferred to Islington, what very fine effects might be obtained in the general arrangement which is now so broken up at the Aquarium. When at the Agricultural Hall, I could but think what folly it was, with such a grand building at hand, to propose, as was so lately done, the building of a place on the Thames Embankment for the holding of a great National Fruit Show. Happily that project was dropped, but if ever it is revived, surely it would be madness to incur an enormous expense to put up a special building when the Agricultural Hall was at hand, and so accessible from all parts of London. Should the Royal Horticultural Society arrange to hold another show at Islington next year, it would be an immense encouragement to fruit growers were the schedule framed to allow choice fruit to be shown only two days, and then the promoters of the proposed City fruit show might be disposed to give prizes for other fruit classes for the following two days, and thus enable this great exhibition to become what it should be—the great annual fruit exhibition of the metropolis. *A. D.*

FRUIT-GROWERS AND MARKET PRICES.—Your correspondent, "Alpha," p. 244, in his caution to fruit-tree planters, appears to have a very poor opinion of growing fruit for market, and his caution ought certainly to be investigated—but his prices must also be inquired into. His quotations are bad, and show there must be a mistake somewhere. For the benefit of growers, I give a list of prices obtained from Mr. George Monro, salesman, Covent Garden Market, for fruit grown and sent from the county of Stafford, and I think "Alpha" himself should carry the matter further, and give us the name of his salesman. The following are some of the returns from Mr. Geo. Monro: August 30, 1893, twenty-four Nectarines at 10d. = £1; twenty-seven small at 7d. = 15s. 9d. August 29, one hundred Peaches and Nectarines, £2 18s. 11d., or a little over 7d. each.

August 15, twenty-eight Nectarines at 1s. each = £1 8s. Now, say two fruits are grown per foot of surface, or eighteen to the square yard, at the latter price, after deducting carriage and commission, will leave a respectable price, and one at which fruit can be grown at a profit. The grower here sends fruit of first-class quality, both in size, colour, and ripeness, and I hope "Alpha" will compare the above with his prices. *Robt. Cock, Horticultural Lecturer, Staffordshire County Council.*

—As fruit arrives so often damaged, no one can judge whether growers have been dealt fairly by without seeing the consignment, and knowing all the circumstances. Salesmen have a bad name amongst a class of small amateurs whose goods, as a rule, do not pay a salesman to take in. I am glad to say, that where we have business people to deal with, we can always satisfy them, and I for one am quite content, when you have any complaint referring to any sales of mine to offer the fullest investigation. I also think you should make such writers substantiate their complaints before publishing them. *Salesman.*

—In August, 1892, I sent five consignments (twenty-six dozen) of *Eucharis amazonica* flowers, the individual blooms being large, of fine substance, and perfectly fresh, to a fruit and cut-flower salesman in Covent Garden Market, sending him consignments of Peaches at the same time. Sale notes of returns for the fruit were duly received, but none for the *Eucharis* (although repeatedly asked for) until the supply was exhausted. At length I was put in possession of a document, of which the following is an exact copy (omitting the name and address of the salesman):—"Aug. 19, 4 dozen *Eucharis*, not sold, market glutted, and no sale for them." (They were quoted at the time at from 2s. 6d. to 5s per dozen in the gardening papers.) "Aug. 20, 3 dozen *Eucharis*, not sold; 3 dozen *Tuberosea*, 1s 3d. Aug. 23 114 *Eucharis*, not sold; 8 dozen *Tuberosea*, 1s. 6d. Aug. 26, 5 dozen *Eucharis*, not sold. Aug. 27, 4 dozen *Eucharis*, not sold. Total for *Tuberosea*, 2s. 9d.; less toll, 2d.; commission, 3d. = 5d." "Flower trade very bad indeed," being appended by way of explanation! *A Victim.*

—I have read with interest the letters in your last issue from "Alpha" and "A. D." with respect to the low prices of fruit this season. Certainly a dismal tale is told—perhaps too dismal, considering how every fruit-grower this year has had to face the most unwelcome of all things to him—viz., a glut of fruit. I will take "Alpha's" letter as it stands:—Peaches at 4d. or 6d. a dozen either shows that his fruit is much below ordinary quality, or he should change his salesman. Golden Gages and Washington Plums, he should remember, cannot be expected to realise a fair price per box when other growers are marketing them at the rate of 50 bushels per day. Apples, every grower knows this year, are a poor trade; yet returns from the Midlands last week show 4s. 6d. per bushel for good Warner's King. Now, as to remedy. It may be years before another such a crop of fruit as this season's shows itself, and perhaps by the time it does come, many fruit-growers will have gained considerable experience—certainly as to the low price that fruit can make, if nothing else. Fruit-growers are in the hands of the salesman—there is no help for it; and until some one comes along with a remedy, they must continue to patronise him. They all know that fruit, after it leaves his care, realises double—often more—than he sells it at. The fruit-grower would like to get his produce direct to consumer—of that all are agreed. How can he do it? He has 500 or 1000 bushels of Plums fit for gathering—a day's delay cannot be thought of—are they to spoil while a remedy is being found for obtaining higher prices direct from the public? A firm of fruit-growers near Cambridge have turned their fruit produce for several seasons now into jam. The manner in which this firm buys up fruit, clearly proves that jam-making is a profitable undertaking, for we all know that be there glut of fruit or not, jam is never any cheaper one year than another. As a venture, let some of our fruit-growers follow this precedent, and I feel certain a better return is in store for them. They must themselves make the jam, and label it according to variety; people are beginning to know fruits by their proper names. This is certainly a better plan than spending money in heavy carriage on fruit to dubious salesmen; and advertise your wares, a good article always selling well. In conclusion, I give a few returns from the principal markets during the last

week, and would suggest both to "Alpha" and "A. D." that they should set about remedying the state of things they complain of rather than furbishing up old material which the fruit-grower has by sad experience learned long since to quote:—Peaches, good, 5s per dozen; Apples, already quoted; Plums, 2s 9d. and 3s. per half-sieve; Pears, 3s. per bushel; Tomatos, 3s. per peck. *Apricot.*

FINE PEASGOOD'S NONSUCH APPLE.—We think it may interest some of your London readers to know that the exceptionally fine specimen of Peasgood's Nonsuch Apple (26 oz.), referred to by Mr. Lake in your issue of August 26, is now on show in our window at 53, London Wall. It is a very perfect and beautiful fruit. *Carter Page & Co.*

UNTIMELY FLOWERING OF RHODODENDRONS.—As showing the effect of the late drought on vegetation, it may be of interest to your readers to know that on the lawn at Gosfield Hall, Ilalstead, Essex, a bush of *Rhododendrons* was in full flower at the end of August. The bush measures 60 feet in circumference, and 10 feet in height, and it had a very attractive appearance. The plant did not flower at the usual time, but on rain coming in the end of July, its flower-buds, which had so long remained dormant, commenced to expand. The rest of our *Rhododendrons* flowered as usual. *J. F. Morgan.*

ROOT-PRUNING IN THE NORTH.—Your able correspondent, Mr. Markham, is desirous of learning what effect root-pruning has on fruit trees in the North (Scotland). The answer to the question is, that, wherever the work is performed judiciously, the best results follow. I use the word judiciously to make a distinction from the ruthless method of hacking off roots, large and small, just as the operator comes across them. I am quite in touch with what Mr. Markham says on the piecemeal method of removing roots which are causing gross unfruitful growths, and the removal of those known as tap roots should be imperative; and others, descending into the subsoil from the action of sun and air, should have their progress arrested by cutting off, or lifting them upwards. Whatever is conducive to formation of fibre is also conducive to fruitfulness, healthy foliage, and moderate wood growth. In the North it is important to secure an early and healthy resting period for fruit trees, and wherever roots have been properly manipulated, this desirable state of matters is realised. *M. Temple, Carron House, Stirlingshire.*

SUMMER-PRUNING OF FRUIT TREES.—There is a great diversity of opinion as to the time when, and the extent to which, the trees should be operated on, and there are some people who go so far as to question whether summer-pruning is really needed. I am fully convinced myself that when it is judiciously performed, summer-pruning is one of the greatest possible aids towards the successful cultivation of fruit in the open air. For some years past I have been testing summer-pruning at different times during the summer months, and kept a register of these, and I find the best time for summer-pruning of old trees upon walls is, first operation to take place early in July, all the strongest of the shoots should then be removed by breaking, or cutting by pruning scissors, or if the spurs are close together and appear crowded, I have had the shoots wrenched away in preference to cutting; the first removal of summer growths will let in sun and air, which, in my opinion, is very essential at that time of year. The second operation to take place either at the end of July or early in August. The trees then might be made to look neat at this operation by removing all shoots that were left at the first pruning; and in September the spurs should be thinned out to let in more sun and air to ripen the buds. That system of summer-pruning I have found very successful for old trees upon walls. For bush, or espaliers, or pyramid trees, I have found, after carefully studying the matter, the best time to commence summer-pruning is about the first week of July, and then only to thin out the growths, always leaving the shoots full length for the extension of the branches without shortening, until October, then those shoots may be shortened about half their length, and I prefer doing the work of thinning at twice rather than at one operation. I have found in removing a large quantity of summer growth, that too great a check is given to the fruit tree or trees. My practice is—and the experience of some years convinces me to be one of the best, and this system of summer-pruning I am teaching

in twenty-four districts of Shropshire, and have been for some weeks past, but for young fruit trees I advocate full extension of the summer growth; the growths to be fastened and trained during summer to get them well matured. For cordon trees I have practiced extension, by allowing some of the shoots to grow at will, bending them over and otherwise fastening them for neatness; and by thinning out some of the growths in July and August, have found those trees much more fruitful and kept more healthy than when the cordon trees was under the early pinching from May onwards. I am an advocate for allowing some summer growths to remain on the trees unchecked until autumn, and have found it answers well. For the old Plum trees upon walls, I have practised the system of having some of the summer shoots fastened to the old branches, if there was not room between the branches, and have found it answer well, for it is well-known amongst gardeners that Plum trees are often not fruitful on the spurs, when the spurs are allowed to extend far away on the front of the branches. I have been very successful with the shy-bearing Greengage Plum under this system of management, and have applied it successfully to other varieties of Plums. *Robert Smith, Shrewsbury.*

THE VICTORIA REGIA.—By reference to the *Proceedings of the Botanical Society of London*, vol. i., part I, 1839, your correspondent "W. W." will find that a paper was read, accompanied by drawings, from Mr R. H. Schomburgh, dated New Amsterdam, River Berbice, May II, 1838, on what he considered to be a new species of *Nymphaea*, but which the President had compared with *Nymphaeaceae* in the herbarium of the British Museum, and was satisfied that it would form a new group intermediate between *Nymphaea* and *Euryale*, and therefore proposed that Mr. Schomburgh's intention of naming it after her present Majesty, Victoria, should be carried into execution, her Majesty having previously granted her permission. It was therefore named *Victoria Regia*, and the Society has adopted this plant as its emblem. Mr. Schomburgh remarks: "In my rambles through the West Indian Archipelago, I had frequently met the white Water Lily; but the remark of an eminent botanist, that these floating plants were entirely unknown on the Continent of South America, did not make me expect to find a representative of that tribe, which for the superior grandness of its leaves, the beauty of its flowers, and its fragrance, may be classed amongst the grandest productions of the vegetable world. It was on January 1 this year, while contending with the difficulties Nature opposed in different forms to our progress up the River Berbice (in British Guiana), that we arrived at a point where the river expanded and formed a currentless basin. Some object on the southern extremity of this basin attracted my attention. It was impossible to form any idea what it could be, and animating the crew to increase the rate of their paddling, shortly afterwards we were opposite the object which had raised my curiosity. A vegetable wonder! All calamities were forgotten. I felt as a botanist, and felt myself rewarded. We met them hereafter frequently, and the higher we advanced the more gigantic they became. We measured a leaf that was 6 feet 5 inches across its rim, 5½ inches high, and the flower 15 inches across. The flower is much injured by a beetle (*Trichius*), which destroys completely the inner part of the disc; we have counted sometimes from twenty to thirty in one flower." The beetle, of which specimens are deposited in the cabinets of the British Museum, is the *Rutela trilineata* of Guerm., *R. Schomburghii* of Hope, and *R. Ceta* of Weber. *J. Garbett, Canford.*

Absence from home last week prevented me referring "W. W." to a figure of the *Victoria*, "in the open air," in the *Dictionary of Gardening*, by the present Curator of Kew, and which shows the outer and older leaf flattened out, as described by me. Further, if the leaves are turned up to prevent aquatic animals from getting on to their surface, as "W. W." suggests, Nature appears to have also taken means to defeat that end, for Dr. Schomburgh, in his description of the plant in its native habitat, says, "Many aquatic birds were running to and fro on the leaves, chasing the numerous insects which were humming around the flowers." The leaves of the *Victoria*, I may add, are extremely tender in texture, and are probably never seen, in the natural state, as entire as in our hot-houses. I once heard Sir Jamsetjee Jeejeebhoy say he never saw the *Musa Cavendishii* so entire in India as in a hot-house in this country. In the open air they are ragged. *Vic.*

AN EXPERIMENT WITH POTATOS: TWO CROPS PER ANNUM.—We commenced to dig our early Potatos out-of-doors on May 26 this year, and as we like new Potatos, we replanted the same ground, as it was cleared, with fresh sets of the same variety of Ashleaf Kidney. To-day, August 26, we have commenced using the second crop. They are sound, good, and plentiful, and as many people, like ourselves, prefer new Potatos to old ones, the experiment is worth repeating. *Thos. Fletcher, Grappenhall, Cheshire.*

ASPARAGUS IN LANARKSHIRE.—The culture of Asparagus is practised with great success much further north than any part of Lanarkshire, but soil has often much more to do with this than either latitude or altitude, and where the land is heavy and damp with a clayey subsoil, it is almost impossible to get the plants ripened early enough to be at rest before winter sets in. Where the crowns and roots are full of sap at the end of the year, decay from damp attacks the roots at the collars, and oftentimes all over. When such is the case, artificial treatment must be resorted to in order to combat with the evils, and that is not an easy matter so far as labour is concerned. After thoroughly draining the whole of the soil in which the Asparagus roots are to grow, it should be raised by adding pasture-turf, road-scrappings, half-decayed garden-rubbish, burnt-earth, and even coal-ashes and brick-rubbish. There should be a good depth of soil placed above these, at least 18 inches, which should be well mixed with sand. Beds 4 feet wide should there be formed, and the roots planted thereon in rows, the planting being done with plants just beginning to grow. The finest Asparagus I have ever seen was grown near Perth and Dundee. *M. Temple, Carron House.* [The above was kindly furnished by our correspondent, himself resident in Lanarkshire, in answer to our enquiry from "M. L. B.," another Lanarkshire gardener, desirous of ascertaining the possibility of cultivating Asparagus on a cold, retentive soil, his previous attempts having ended in failure. *Ed.*]

A USE FOR WIND-FALLEN APPLES.—It is a very common practice in many households to brew ginger-beer; if, instead of using lemons for this, they are replaced by Apples roughly sliced, and boiled in water to a paste, the result is both cheaper and better, either with or without a small quantity of ginger. Apples which are quite unsaleable are quite good for this purpose, and when windfalls are plentiful they may be used to advantage; about 1 lb. of Apples per gallon will be a liberal quantity. We have used Plums, Currants, honey, and Gooseberries, for the same purpose, the three latter being very satisfactory. *Thos. Fletcher, Grappenhall, Cheshire.*

SOCIETIES.

ROYAL SCOTTISH ARBORICULTURAL.

(Continued from p. 281.)

The New Forest.—On the Friday an early start was made by road for Lyndhurst, once more the starting-point, to examine the northern parts of the forest. Here we were again met by Mr. Lascelles, who stopped our vehicles for the first time at Malwood, the sylvan retreat of the Chancellor of the Exchequer. On the site of an ancient entrenchment, and of a more recent keeper's lodge, this lovely spot, for which Sir William Harcourt has to pay a considerable ground-rent to the Crown, commands the most exquisite views of Southampton Water, the distant Isle of Wight, and the surrounding forest. The house has, in fact, been built to fit the views, which have long been gained by "peeps" cut through the trees. Though not completed more than ten years, the lower storey is densely festooned with many different creepers, anent which a story is told which is too good not to be repeated. An admiring lady remarked to the learned owner, "Surely, Sir William, your creepers grow so well, so very much better than we can grow them, it must be because God loves you very much." "No, Madam," was the reply, "it is not that. It is pig-manure."

We then descended the slope into Canterton Valley to inspect Rufus' Stone, or rather the iron case that now enshrines the stone which marks the spot where the Red King was most assuredly murdered. Having read the inscription, we divided into two parties, one under the leadership of Mr. Lascelles, walked through the fine old wood of Long

Beech, dating from 1771-6; and the other, under that of his clerk, Mr. Campbell, through King's Garn plantation, a wood of Oak, with Scots Fir nurses, dating from 1870. This latter, which has already yielded a good crop of thinnings, both of Fir-poles and of Oak-fittens, as mine-timber, seemed very promising, though not as ornamental as older woods, or as those planted without Coniferous nurses. The soil is poor for Oak; in fact, for a good quality of Oak timber free from shake, there is hardly any suitable land in the Forest.

Having re-united on Fritham Plain, we next started to walk through Bentley's Plantations, before reaching which we had an opportunity of seeing the method here adopted for cutting turf. This "common of turbarry," now falling into disuse, consists in paring a clod of Heather roots with the slight adherent humus, two clods being supposed to be left for each clod taken in any one year. Poor as the heath-land naturally is, and poor as is the fuel thus obtained, no true peat being dug in the forest, this practice is as sure a method as could well be imagined for still further impoverishing these barren wastes.

North and South Bentley's, with the not far distant Salisbury Trench, which we saw but did not visit, are extremely interesting both from their origin and from their present condition. They were planted in 1700. "Pits or beds of three spits of ground each were dug a yard apart, and three acorns planted triangularly in each bed. . . . The ground was [then] sown with hawes, Holly-berries, Sloes, and Hazel-nuts, and drains cut where necessary." The soil was bad, and the plantations were never thinned; but yet they have yielded, and still might yield, a heavy crop of Oak timber. It was of Salisbury Trench that M. Boppe and his colleagues from Nancy reported some years ago that they had never elsewhere seen so great a number of cubic feet of Oak on the acre. The trees are immensely drawn up, and though now thinned, are still thick. They are all at, or past, their maturity; but the Commissioners may not clear the woods, as scientific forestry would advise, whilst they dare not thin much more lest the wind getting in should blow down the whole of these spindly poles. Holly is now the chief remaining undergrowth.

After this instructive object-lesson in the difficulties of the present New Forest management, we retraced our steps to Canterton Valley, where a most acceptable lunch awaited us under the trees. Mr. Lascelles was cordially thanked by the party for his two days' chaperonage, and the machines had soon after to be remounted for the return-drive to Southampton, by way of Cadnam and Totton, in order that the 7.25 train might be caught for London.

TROWBRIDGE HORTICULTURAL.

AUGUST 23.—For forty-four years this Society has held an exhibition at Trowbridge, and it is among the most popular of the West-of-England exhibitions. Singular to state, it is very rarely indeed that the day is wet, and the Society is invariably in a flourishing financial position. Mr. James Huntley, the popular Hon. Secretary, has filled this position for about thirty years. The late exhibition took place, as usual, in the public ground adjoining the railway station, and five large tents were required to display the exhibits.

Stove and Greenhouse Flowering Plants.—These were extensively and admirably shown, the chief prize-winner being Mr. H. Matthews, gr. to Sir R. W. Brown, Bart., Trowbridge, who was 1st with nine, and also with six and three, staging well-grown and bloomed clean and fresh examples of *Ericas*, *Allamandas*, *Dipladenias*, *Ixoras*, &c. The other successful exhibitors of these plants were Mr. G. Tucker, gr. to Major W. P. Clark; Mr. H. Pocock, gr. to J. P. Haden, Esq.; and Mr. J. Hiscox, gr. to E. B. Rodway, Esq., all of Trowbridge. The best specimen plant in flower was a fine *Eucharis amazonica* from Mr. H. Triff, gr. to Major F. Clark, Trowbridge.

Fuchsias were superbly shown by the champion grower of the west, Mr. J. Lye, gr. to the Hon. Mrs. Hay, Clyffe Hall, Devizes, who was 1st with six and four varieties, specimens 7 feet or so in height, grandly grown and bloomed. Mr. Lye's six varieties were all of his own raising, very dark varieties, Charming, Abundance and Rival; and of light varieties, Mrs. Bright, Harriet Lye, and Pink Perfection. Mr. Geo. Tucker was 2nd, and Mr. H. Pocock 3rd, the latter with plants far above what is usually seen about London. Mr. Lye's four varieties were Final and Mrs. Rundell, dark; Louise Balfour and Western Beauty, light. *The Gardeners' Magazine*

Medal for special excellence in culture was awarded to Mr. Lye for his splendid specimen of *Fuchsia Charming*. By amateurs and cottagers, *Fuchsias* were also finely shown.

Next in value in reference to these splendid developments were the *Petunias*, and here again Mr. J. Lye was 1st, with six plants, grown, it is true, in large pots, which were raised from cuttings struck in April. The plants are trained to slanting-over wire trellises; the growth was perfect, and each plant carried from 100 to 150 grand blossoms. Good soil, close attention, and plenty of water had produced these plants, and, like the *Fuchsias*, they were in the open for a considerable part of the summer. Other exhibitors had good plants also. *Achimenes*, *Gloxinias* (very fine for the time of year), *Begonias*, *Cockscombs*, *Balsams*, and zonal *Pelargoniums* were all very good, not excepting the plants grown by cottagers. Groups of plants arranged for effect also made a good feature.

Foliaged Plants were represented by *Palmas*, *Crotons*, *Caladiums*, *Coleus*, and *Ferns*, the latter in collections of fifteen, including mosses. The best group came from Mr. G. Tucker, and included a very fine example of the silvery *Gymnogramma peruviana argyrophylla*, which is well-grown in this locality; Mr. H. Pocock was a good 2nd.

Dahlias, *Gladioli*, *Hollyhocks*, zonal *Pelargoniums*, *Pansies*, and others, were also numerous; as were collections of wild flowers, bouquets of the same, &c.

Fruit.—It was the finest exhibition of fruit, perhaps, ever seen at Trowbridge. There were five collections of ten varieties. Mr. W. Strugnell, gr. to Walter H. Long, Esq., M.P., Rood Ashton, was 1st, with *Black Hamburg*, *Alnwick Seedling*, and *Muscad of Alexandria Grapes*; *Bellegarde Peach*, *Stanwick Elruge* and *Pine-apple Nectarine*; *Jefferson's Plum*, *Brown Turkey Fig*, and *Morello Cherries*; a capital lot, admirably staged. 2nd, Mr. G. Pymm, gr. to Mrs. Hardwick, Bradford-on-Avon, with six varieties, there being also five exhibitors. Mr. C. Bull, Crediton, had the best *Pine*, a good *Smooth Cayenne*; and Mr. Strugnell came 2nd, with a *Queen*. Mr. A. H. Newman, Bath, had the best *epergne* of fruit and flowers; Mr. E. T. Hill, Westbury-on-Trym, was 2nd. *Black Hamburg Grapes* were well shown by Messrs. Marsh, of Bath, and T. Jones, Combe Down. *White Grapes*, excluding *Muscats*, by Mr. Marshall, gr. to J. Dole, Esq., Bristol, and Mr. J. Gibson, gr. to Earl Cowley, Chippenham, both of whom had well-finished *Buckland Sweetwater*. Messrs. Jones and Gibson were 1st and 2nd with any other black, both having *Madresfield Court*; and the same exhibitors were 1st and 2nd, with capital *White Muscats*. *Green Gage Plums* were numerous and good, and of other *Plums*, there were good dishes of *Jefferson's*, *Kirke's*, *Reine Claude de Bavay*, and *Magnum Bonum*. *Cherries* were represented by *Morello*. The two best single dishes of *Peaches* were *Vanguard* and *Chancellor*. The best *Nectarines* *Pine-apple* and *Elruge*. The two best dishes of *dessert Apples* were *Worcester Pearmain* and *Ribston Pippin*. *Astrachan*, *Cellini*, *Quarrenden* and *Cox's Orange Pippin* were also shown. Mr. Strugnell had the best two dishes of *culinary Apples* in *Peasgood's Nonsuch* and *Warner's King*, both very fine. Lord Suffield, *Emperor Alexander*, *New Hawthornden*, &c., were also in fine character. The best *dessert Pear* was *Beurré d'Amanlis*; *Bon Chrétien* taking the 2nd prize.

Vegetables were wonderfully fine throughout. Space does not admit of going into details. A collection of bunches of garden *Roses*, shown by Messrs. Cooling & Sons, among the miscellaneous exhibits, was much admired.

Cut Flowers were numerous and very fine. In the open classes for *Roses*, Dr. Budd, Bath, was 1st with twelve *trebles*, and also for twenty-four *singles*, having some beautiful flowers for the time of year. Messrs. Geo. Cooling & Sons, nurserymen, Bath, being 2nd in both classes. In the amateurs' division, Mr. Thomas Hobbs, Lower Easton, Bristol, was 1st with twelve *trebles*, and also with twelve *blossoms*, Dr. Budd being 2nd in both cases. *Asters*, both *quilled* and *flat-petalled*, were numerous, and decidedly good, considering the weather. Boxes of twenty-four varieties of *cut flowers* made a fine feature. *Verbenas* and *Carnations* were fairly good. Bunches of twelve varieties of *hardy annuals*, really superb, were shown well by several contributors; the best came from Mr. F. Hooper, Widcombe Nursery, Bath.

The best twenty-four *Dahlia* came from Messrs. Keynes, Williams, & Co., Salisbury; Mr. George

Humphries, Chippenham, was 2nd. With twelve varieties, Mr. F. Lindsey, Frome, was 1st; and Mr. S. Cooper, Chippenham, 2nd.

Seedling Dahlias, for *certificates*, were shown by Messrs. Keynes, Williams & Co., and they had a box of new forms of *Cactus Dahlias*; and were 1st with twelve bunches of *Pompon Dahlias*, single and fancy.

BASINGSTOKE HORTICULTURAL.

August 24.—A successful show was held by the above in Hackwood Park, on the above date, by permission of C. Hoare, Esq. Mr. Bowerman, the gr. at Hackwood Park, took the 1st award for twelve plants in pots; and Mr. Russell, gr. at Audley Wood, took the same place for six plants. The best six foliage plants were shown by Mr. Weaver, gr., Oakley Park, and he also had the finest specimens of exotic *Ferns*. *Fuchsias* and tuberous-rooted *Begonias* were creditably shown, the former by Mr. Russell, the latter by Mr. Brown, gr., Beaurepaire Park. Mr. Best's table plants were very fine, and those of other exhibitors very good, and not far behind them. Groups were creditable productions, Mr. Bowerman taking the highest prize, and Mr. Weaver the next highest.

Cut flowers in great variety were shown, and were generally good in quality, if *Roses* be excepted.

Fruit was a heavy item, and the winning collection of eight kinds was Mr. Bowerman's; the 2nd best being Mr. Osman's, Ottershaw Park. The Hackwood Park *Hamburg Grapes* were the best—Mr. Brown took the highest prize for *Muscats*, and Mr. Osman for any other white variety.

Vegetables were abundantly and well shown, and several special prizes were competed for besides the Society's prizes. Mr. Lye, gr., Sydmonton Court, Newbury, won Messrs. Sutton & Son's 1st prize for six kinds, and also Messrs. Sharpe & Sons'; whilst Mr. Bowerman secured Messrs. J. Carter & Co.'s premier prize for an unlimited collection, also Messrs. Webb & Son's, of Stourbridge.

THE ROYAL OXFORDSHIRE HORTICULTURAL.

August 24.—This society, established as far back as 1830, held the third of its annual exhibitions on the above date in the beautiful grounds of Headington-hill Hall, the residence of G. H. Morrell, Esq., on the north-east side of the city. Two very large tents, joined together to form one, were required for the exhibits, and in addition, some of the vegetables had to be placed in the open air. This exhibition was considerably extended by adding to it an exhibition of gardening produce from the allotments in the different wards, there being a large number of such gardens, and the produce generally proved remarkably good, and the competition in almost every class was very keen.

Stove and greenhouse plants were fairly well shown, considering the somewhat low prizes offered, and in the class for a single specimen hardy plant in flower, very fine examples of *Sedum Fabaria* were staged. Some good *Fuchsias* were shown by Mr. J. Mattock, nurseryman, Oxford. *Begonias*, double and single, made a good feature, and the single and double zonal *Pelargoniums* shown by Mr. J. Johnson, nurseryman, Garsington, were very fine. *Exotic Ferns* were in excellent form, but as the number of the exhibitors were not placed on them, we are unable to give particulars. *Coleus* were in the form of well-coloured bushes.

Cut flowers were numerous and very good, and were throughout a very attractive feature. Excellent bunches of *cut double and single zonal Pelargoniums* were shown by Mrs. Wooten-Wooten and Mr. John Walker, Thame. With twenty-four *Dahlias*, Mr. Walker was 1st, with capital flowers; Mr. J. Tranter, florist, Henley-on-Thames, was 2nd; and eighteen *blossoms* were also well shown. *Single and pompon Dahlias* made very fine features, and the *Cactus varieties* highly attractive. Some remarkably good *Roses* were shown by Mr. J. Mattock, who was 1st with eighteen varieties, having in fine condition *Suzanne-Marie Rodocanachi*, *Auguste Rigotard*, *Duchesse de Bedford*, *Merveille de Lyon*, *Mrs. John Laing*, *Star of Waltham*, *Baroness Rothschild*, *Cornelia Koch*, *Comtesse de Nadaillac*, &c.; 2nd, Mr. J. Tranter, *Gladioli*, *Asters*, *Helichrysums* in bunches, *herbaceous Phloxes*, *annual Phloxes*, &c., were all good in quality and numbers. Mr. J. Johnson had the best twelve bunches of *hardy perennial and bulbous plants*, staging a very fine lot indeed in

imposing bunches; and he was also 1st with six bunches of *herbaceous Phloxes*.

Fruit was much more numerously produced than is usual. The best three bunches of *white Grapes* were *Buckland Sweetwater*, from Mr. C. D. Bait, Witney; Mr. Horell, The Gardens, Headington-hill Hall, being 2nd, with *Muscad of Alexandria*. The best two bunches of *Black Hamburg* were from W. A. W. Musgrave, Esq., Thame Park; Colonel Meller, Shotover, was 2nd. In the class for black, other than *Hamburg*, some excellent *Alicante* were shown from *Naneham Park Gardens*; Mr. Robens, *Hartwell Gardens*, *Aylesbury*, being 2nd with the same. The best *dessert Plums* were *Jefferson's* and *Kirke's*; the best *cooking White Magnum Bonum* and *Pond's*. *Bon Chrétien* and *Beurré d'Amanlis* were the best *dessert Pears*; *Worcester Pearmain*, *Kerry Pippin* and *Ribston Pippin*, the best *dessert Apples*. *Emperor Alexander*, *Stirling Castle*, and *Peasgood's Nonsuch*, the best *culinary*. *Currants* were remarkably good, *Filberts* and *Figs* also.

In the amateurs' division, plants were fairly well shown, and *cut flowers* good. The best six bunches of *hardy perennials*, and also of *annuals*, set up by Mr. W. F. Cross, were very fine; among the latter was a variety of *Cosmos bipinnata hybrida*, with red flowers, worthy of being noted as well suited for this purpose. *Roses*, *Dahlias*, &c., were decidedly good.

Vegetables were very good indeed, and we have to be content with mentioning the fact. We have reason to believe the show was a decided success all round.

RUTHIN HORTICULTURAL SHOW.

August 24.—A summer show of flowers, plants, and fruit was formerly a most successful institution in connection with the picturesque town of Ruthin, in the Vale of Clwyd, North Wales. From various causes, however, it languished, and then died. Some years afterwards a "Christmas show" on something of the same lines was instituted, resulting last year in a fair balance being obtained; consequently, the committee of the winter exhibition resolved upon a bold stroke—the resuscitation of the defunct summer show. To add to its interest, the sheep-dog trials were amalgamated with it, and a series of athletic sports were attached as a sort of gay ribbon to attract the masses! A strong committee carried out the arrangements, and the residents supported them well by their subscriptions. Col. W. Cornwallis West kindly allowed the exhibition and sports to take place on the lawns in front of his beautiful residence, Ruthin Castle, while the dog trials came off in the park. The show was held on the above date, resulting in a very large gathering of the public, excursions being run from *Rhyl*, *Denbigh*, *Mold*, *Corwen*, and other places. Col. West gave a brief address as a kind of opening ceremony, in which he commended the cultivation of flowers as a means of recreation for the Welsh peasantry, and suggested that it might be possible to organise some system of sending the vegetable produce of small country gardens to such places as holiday resorts, where the consumption of such produce during the season is enormous.

Plants.—For a circular group of plants, arranged for effect, Mr. H. Forder, gr. to Colonel Cornwallis West, was placed 1st with a light and graceful arrangement, consisting of well-coloured *Crotons*, *light Palms*, *Lilium longiflorum Harrisii*, *L. lancifolium*, *L. speciosum album*, and *L. s. roseum*; and grand spikes of *Tuberose*, mixed with *Maidenhair Fern*. Mr. W. J. Bligh, gr. to P. F. Lyster, *Plas Isafin*, was 2nd, with a very pretty arrangement, but rather too flat and stiff.

For six *stove and greenhouse plants*, Mr. W. Price, gr. to Colonel Mesham, was 1st with a grand lot; Mr. Bligh and Mr. Forder following in their order.

Six Plants for Dinner-table Decorations.—The competition for these was very keen, the 1st prize going to Mr. H. Forder. His best plants were *Pandanus Veitchii*, *Croton Aigburth Gem*, and *Peonoma gracilis*; and Mr. H. Bennett, gr. to Rev. J. Gallagher, *Clwyd Hall*, was 2nd, with a neat lot.

Cut Flowers.—Twelve *Roses*, 1st, Mr. G. Goodwin. Six *Roses*, 1st, Mr. A. Goodwin. Twelve *double Dahlias*.—These made a grand display. Mr. H. Forder was 1st, with large well-finished blossoms.

Prizes were offered for twelve bunches of *annuals*, twelve bunches of *herbaceous flowers*, twelve *Asters*, twelve *stocks*, &c. These were secured by Mr. H. Forder, Mr. Bodsworth (gr. to Lady Fitzpatrick, *Plas Draw*, *Ruthin*), and Mr. Curtis (gr. to J. W. Lumly, Esq., *Haulfre*, *Ruthin*), in their order.

Colens, Begonias, Fuchsias, Pelargoniums, single Dahlias, Gladiolus, cut blooms of stove and greenhouse plants, and hand bouquets were shown in considerable numbers.

Fruit was abundantly shown, Messrs. Forder, H. Bennett (gr., Mostyn Tallaers), Kelly, J. Price, J. Hubbard, and J. Jones being the chief prize-takers.

In the vegetable competition, Mr. Forder took 1st prize for twelve kinds. Mr. Forder won for a collection of Potatoes. Mr. G. Brockenhurst, Firgrove, was best in the Tomato competition.

Prizes were offered for single dishes of vegetables of nearly every kind, and the competition was keen, Messrs. Forder, Bligh, Price, Jones, and Bellis being the principal prize-winners.

The judges were Mr. D. Hughes, Chester; and Mr. Cowburn, Manchester, and their decisions gave every satisfaction.

THE BATH FLORAL FETE.

AUGUST 30, 31.—This, the second of three exhibitions held during the present year, was in all respects very fine—one of the best of its kind ever seen in Bath. Stove and greenhouse plants were a great feature. The best eighteen, twelve foliage and six flowering, came from Mr. James Cypher, nurseryman, Cheltenham—a superb group, included grand specimens of *Kentias Forsteriana* and *Bellmoreana*, *Phoenix rupicola*, *Cycas undulata*, and *C. circinalis*, *Crotons Sunset*, *angustifolius*, *Bougainvillea glabra*, *Ixoras Williamsi* and *Pulgrimi*, &c.; 2nd, Mr. J. F. Mould, nurseryman, Pewsey.

In the class for eight foliage plants, Mr. Cypher was again 1st; his *Crotons* were very fine, and there was a very good example of *Caryota soubulifera*.

In the class for six stove and greenhouse plants in flower, Mr. Cypher and Mr. Geo. Tucker, gr. to Major W. P. Clark, Trowbridge, were placed 1st, each having some excellent plants. Specimen plants were also very good, and the same applies to Ferns, Mr. G. Tucker being 1st with a very fine collection.

As at Trowbridge so at Bath, Fuchsias were a very fine feature, Mr. James Lye, The Gardens, Clyffe Hall, Market Lavington, being 1st with nine, having admirably grown and flowered specimens. Mr. W. Marchant, gr. to J. Murch, Esq., the Mayor of Bath, was 1st with six specimens, mostly of Mr. Lye's raising. Single specimens, light and dark, were very good also. Tuberous-rooted Begonias were represented by very fine specimens, and Mr. Lye also exhibited his capital *Petunias*. Groups arranged for effect made an excellent feature, Mr. Cypher being 1st with one that was perfect at all points. Other flowering plants were numerous and very good, including fine examples of *Lilium speciosum*.

Cut flowers were numerous and very fine. Mr. Geo. Humphries, nurseryman, Chippenham, was 1st, with twenty-four varieties; and Mr. F. Lindsay, Frome, 1st with twelve blooms. Mr. Humphries also took the 1st prize with twelve fancy varieties, and also with twelve bunches of single. Roses were remarkably good; the best twenty-four blooms were staged by Dr. Budd, Bath. With twelve blooms, Dr. Budd was 1st. Twelve Teas were finely shown by A. H. Gray, Esq., his stand containing a remarkable bloom of the crimson Tea *Souvenir de Thérèse Levet*. Zonal Pelargoniums in twenty-four bunches, and Quilled and French Asters were remarkably good. Stands of twenty-four bunches of hardy annuals made a show in themselves; A. H. Newman, Esq., Bath, was 1st with an admirable collection. Hardy perennials in bunches of twenty-four varieties, were finely shown by Mr. Pritchard, Christchurch, who had a very fine lot. Stands of stove and greenhouse cut flowers were a very fine feature also.

Table decorations and bouquets were excellent; so were collections of wild flowers, and also epergnes and bouquets of the same.

Fruit was a great feature. Mr. W. Nash, The Gardens, Badminton, was 1st with a collection of twelve dishes, having excellent Alicante and Muscat of Alexandria Grapes, *Violette Hative* and Dymond Peaches, Humboldt and *Victoria Nectarines*, Figs, Plums, &c. The best eight bunches of Grapes came from Mr. Taylor, gr. to Mr. Alderman Chaffin, Bath, who had two finely finished bunches each of Gros Maroc, Alicante, Muscat of Alexandria, and Black Hamburg. Mr. C. Warden was 2nd, having good Muscat Hamburg, instead of Black Hamburg. White Muscats were finely shown by Mr. W. Iggulden; Buckland Sweetwater, as any other white, by Mr. J. Marshall, Bristol; Black Hamburg, by Mr. J. T. Jones, Bath; and

any other black was represented by finely-finished Madresfield Court.

Melons were numerous, Peaches and Nectarines good; Plums, Figs, Morello Cherries very good, and Filbert and Cob-nuts were very fine.

The best three dishes of Pears were *Conseiller de la Cour*, *Gansell's Bergamotte*, and *Beurré Clairgeau*, all very fine.

The best three dishes of dessert Apples; *Worcester Pearmain*, *Ribston Pippin*, and *Cox's Orange Pippin*. The best three dishes of culinary Apples: *Emperor Alexander*, *Warner's King*, and *Peasgood's Nonsuch*. The best twelve cooking Apples were the finest examples of *Peasgood's Nonsuch* we have ever seen, taken from a tree against a wall, rich in colour, and grown by Mr. J. B. Payne, Palace Gardens, Wells, the twelve weighing 15 lb.

Vegetables were very fine also, and extremely numerous.

A collection of plants and cut flowers not for competition, was shown by Messrs. Veitch & Son, Exeter; Begonias, double and single, by Mr. B. R. Davis, Yeovil; Apples and other fruits, by Messrs. Geo. Cooling & Sons; and from the same a very interesting collection of garden Roses.

SHOW OF APPLES AND PEARS AT THE MOSELEY BOTANICAL GARDENS, BIRMINGHAM.

AUGUST 29, 30, 31.—With a view to give encouragement to the more extensive cultivation of these fruits in the Midland districts, liberal prizes were awarded for collections, without limit to the numbers, and six exhibits were staged, three of 120 dishes each, the others of a lesser number. The 1st prize was awarded to Messrs. Bunyard & Co., The Old Nurseries, Maidstone, for a very fine collection of large and mostly highly-coloured fruits; 2nd, Mr. J. Watkins, Pomona Farm, Hereford, with not quite such large fruits, but superbly coloured, and of fine quality; 3rd, Messrs. Lane & Son, the Nurseries, Great Berkhamsted, with a fine lot of fruit, not so rich in colour as the others; and by the side of this collection was a good display of Plums in variety, also Filberts and Crabs. In the class for six dishes of Apples, eight fruits of each, Messrs. Bunyard & Co. were 1st, with very fine *Peasgood's Nonsuch*, *Stone's*, *Warner's King*, *Potts' Seedling*, *Cox's Pomona*, and *Lord Suffield*. They were also 1st for six dishes of Pears, eight fruits of each, for very fine *Pitaston Duchess*, *Dr. Jules Guyot*, *Gross Calabasse*, *Beurré Clairgeau*, *Williams' Bon Chrétien*, and *Marie Louise d'Uccle*. It was freely acknowledged to be the finest display of Apples and Pears ever seen in the Midlands, and the quality and colour was a surprise to so many.

Dahlias were also a great feature. Collections of the various kinds in spaces 15 feet long by 4 feet wide being invited, and there was a long attractive bank of these; 1st, Messrs. Perkins & Sons, Coventry; and 2nd, Messrs. Harkness & Sons, Bedale, with a very effective display. An excellent display of Dahlias in competition in the classes for thirty-six and twenty-four was made. For thirty-six blooms: 1st, Messrs. Heath & Son, Cheltenham; 2nd, Mr. John Walker, Thame. For twenty-four Dahlias: 1st, Mr. Walker; 2nd, Messrs. Heath & Son.

Herbaceous and hardy flowers, in twenty-four bunches, dissimilar, were a fine display. 1st, Mr. Walter Childs, Acock's Green, with grand masses, well displayed; 2nd, Messrs. Harkness & Sons, with other exhibits.

Roses, and other classes of cut flowers, were well filled; and Mr. J. White, nurseryman, Worcester, was awarded a Silver Medal for a very attractive display of various cut flowers and fruit, *Gladiolus*, *Cactus Dahlias*, and *Victorin Asters*, being especially fine.

Vegetables were well shown, Messrs. Sutton & Sons' prizes being strongly contested, Mr. T. Wilkins, gr. to Lady Theodora Guest, Blandford, being well 1st with one of his well-known high-class exhibits; and for twelve varieties of the *Pedigree Onions*, nine bulbs of each, and wonderfully fine, a handsome Silver Medal was awarded.

Mr. F. Denning, nurseryman, had a very charming group of plants at the entrance, to which a well-deserved extra prize was awarded.

Mr. Robert Sydenham, Birmingham, gave liberal prizes for vegetables, and there was good competition; as also for prizes for collections by Messrs. Thomson & Co., and Messrs. Hewitt & Co. of Birmingham.

NATIONAL DAHLIA.

SEPTEMBER 1, 2.—The promoters of the National Dahlia Society have much reason to congratulate themselves upon the extent and quality of the blooms which were brought to the Crystal Palace on the above dates. The plants are rapidly recovering from the effects of the drought in early summer; and should the weather continue favourable through the present month, and the nights warm, the bloom promises to be at its very best about the third week in September. Week by week the quality of the flowers improve, and the later exhibitions will show. On this occasion the flowers were arranged in the eastern portion of the nave, and groups of plants and collections of cut flowers flanked them on either side. In no building, perhaps, do bright-coloured flowers like Dahlias display themselves to better advantage, as there is abundance of light above and at the sides. There were blanks in some of the tables, as is usual and inevitable, owing to exhibitors who had entered finding themselves unable to exhibit at the last moment. The arrangements made by Mr. W. G. Head were excellent; staging and judging went very smoothly.

Show Dahlias (Nurserymen's Classes).—There were three exhibitors of sixty blooms, distinct, Messrs. C. Turner, Royal Nursery, Slough, and Keynes, Williams & Co., Salisbury, taking the 1st and 2nd prizes with stands which came very near to each other in point of quality. Of self-coloured varieties, Mr. Turner had fine examples of *Gordon*, bright crimson; *James Vick*, *Imperial*, *John Walker*, the new white self which is being shown in excellent character this season; *Clara*, *John Hickling*, a very fine yellow self; *Grand Sultan*, *Wm. Rawlings*, *J. Standish*, *W. Powell*, yellow; *H. Austin*, *R. J. Rawlings*, *Willie Garratt*, *Purple Prince*, *Sunbeam*, *Mrs. Gladstone*, *Ruby Gem*, *W. Keith*, *Herbert Turner*, *Seraph*, *Agnes*, *Mrs. G. Harris*, *Shirley Hibberd*, *Primrose Dame*, *Nellie Cream*, *Flag of Truce*, *Crimson King*, and a few others. Of edged flowers, *John Bennett*, *Mrs. Langtry*, *Henry Walton*, *Mrs. W. Slack*, *Mrs. Shirley Hibberd*, *Maud Fellowes*, and *Miss Cannell*. Of fancy varieties, *Dazzle*, *Matthew Campbell*, *Comedian*, a beautiful fancy when in true character; *Rev. J. B. M. Camm*, *Duchess of Albany*, and *James O'Brien*. Messrs. Keynes & Co. had a few fine blooms distinct from the foregoing, such as self: *Arthur Ocock*, *Thomas Goodwin*, *Thomas Hobbs*, *Duke of Fife*, *Gloire de Lyon*, *Richard Dean*, *J. Ashby*, and *Colonist*. Edged flowers: *Ethel Britton*, *Mrs. Charles Noyes* (light fawn), *Mrs. Stancomb*, *J. T. West*, &c. Fancies: *Frank Pearce*, *Dandy*, *Hercules*, *Peacock*, *Pelican*, and *Dorothy*.

There were four stands of forty-eight varieties, distinct, and Messrs. Keynes & Co., were placed 1st, with—Self: *Gloire de Lyon*, *A. Ocock*, *T. Goodwin*, *Jas. Cocker*, *W. Rawlings*, *Mrs. G. Harris*, *Crimson Globe*, *Colonist*, *H. Bond*, *H. Keith*, *George Gordon*, *Mrs. Gladstone*, *Mrs. Foreman*, *R. Dean*, *Thos. Hobbs*, *W. Powell*, *W. Jackson*, *W. Garratt*, *J. Huntley*, *J. Ashby*, and *J. Hickling*. Edged flowers: *J. T. West*, *T. J. Saltmarsh*, *Mrs. Langtry*, *Ethel Britton*, *Majestic*, *Mrs. W. Slack*, and *H. Walton*. Fancies: *Peacock*, *James O'Brien*, *Buffalo Bill*, *Rev. J. B. M. Camm*, *Frank Pearce*, *Duchess of Albany*, *Gaiety*, and *Dandy*.

With thirty-six distinct varieties, Mr. John Walker, nurseryman, Thame, was 1st, with excellent blooms of the following:—Self: *W. Rawlings*, *W. Powell*, *John Henshaw*, *Mrs. Gladstone*, *Duke of Fife* (very rich in colour), *Purple Prince*, *John Standish*, *Colonist*, *Crimson King* (singularly bright), *Shirley Hibberd*, *Prince Bismarck*, *Seraph*, *W. Garratt*, *Dr. Moffatt*, *A. Ocock*, *Jas. Cocker*, *John Hickling*, *W. Keith*, *Mrs. H. Glasscock*, *Arthur Rawlings*, &c. Of edged flowers: *Maud Fellowes*, *Mrs. D. Saunders*, *J. T. West*, *Majestic*, *T. J. Saltmarsh*, *Mrs. George Rawlings*, &c.; and of fancies, *Dorothy*, *Hercules*, and *Hartie King*. There were five stands in the foregoing class, and also in that for twenty-four varieties, where Mr. J. Walker was again 1st, having in fine self-character, *Geo. Rawlings*, *W. Rawlings*, *Seraph*, *H. Keith*, *Prince Bismarck*, *Arthur Rawlings*, *Shirley Hibberd*, *James Cocker*, *Duke of Fife*, *Flora Wyatt*, *J. Standish*, *J. Ashby*, *Mrs. J. Grenves*, deep yellow; *Burgundy*, and *W. Powell*. Of edged flowers: *J. F. West*, *Majestic*, *T. J. Saltmarsh*, *Miss Cannell*, *Constancy*, *Mrs. Geo. Rawlings*, and *Maud Fellowes*. Fancy: *M. Campbell*. With twelve blooms, Mr. A. Rawlings, Romford, was 1st.

Cactus and Decorative Dahlias.—These made a very fine feature, and especially the bunches shown by nurserymen. It is gratifying to see the introduction of varieties of the type of *Delicata*, *Robert Cannell*, &c., flowers that are so distinct in character

and beautiful in form and colour that they are certain to drive out of cultivation many of the so-called decorative varieties, which are pretty much what our forefathers discarded half a century ago. There were three exhibitors of eighteen bunches, six blooms of each, and Messrs. J. Cheal & Sons, nurserymen, Crawley, were placed 1st, with Beauty of Arundel, Sir Roger (orange-salmon), St. Catherine, Christine Cheal, Countess of Gosford, Professor Baldwin, Delicata (very beautiful), Bertha Mawley, Countess of Radnor, and Robert Cannell, all these being of the true Cactus character. Of decorative varieties, Duke of Clarence, Honoria, Lancelot, Duchess of York, Ernest Cheal (bright in colour), Black Prince, Josephine, and Mrs. Tait. 2nd, Messrs. Keynes, Williams, & Co., who had of true Cactus varieties, Sir Roger, Lady Penzance, soft yellow, extra fine; Lady H. Grosvenor, salmon-brown base, with cream and yellow centre; Countess of Radnor, and Countess of Gosford; of decorative varieties, Josephine, Rayon d'Or, Apollo, Kaiserin, Maid of Kent, Dawn, Black Prince, Avalanche, Countess of Pembroke, and Lancelot.

With twelve blooms, Mr. George Humphries, florist, Chippenham, was 1st, with Countess of Radnor, St. Catherine, Professor Baldwin, Baron Schroder, Kynereith, Bertha Mawley, Juarez, May Pictor—clean yellow, R. Cannell, Amphion, Sidney Hollings, and Duke of Clarence; 2nd, Messrs. Paul & Son, with Black Prince, R. Maher, Beauty of Arundel, Marchioness of Bute, Lancelot, and Countess of Pembroke, distinct from the first-prize collection. The best twelve bunches of true Cactus varieties came from Messrs. Keynes, Williams & Co., who had Gloriosa, large bright scarlet; Kaiserin, Duke of Clarence, Countess of Radnor, Apollo, Delicata, R. Cannell, Miss Violet Morgan, Bertha Mawley, Countess of Gosford, Chancellor, and Lady Penzance, a very interesting stand; 2nd, Messrs. Cheal & Sons, having differing from the foregoing, Duchess of York, Juarez, St. Catherine, Josephine, Professor Baldwin, Bertha Mawley, Elith Cheal, and Beauty of Eynsford.

Pompon Dahlias (Nurserymen)—Very fine and attractive, also were the collections of twenty-four bunches of pompon Dahlias. Two stands, very close together in point of quality, were staged by Messrs. Cheal & Sons, and C. Turner, the 1st prizes being awarded to the former, who had very fine and effective bunches of ten blooms each of the following:—Fairy Tale, Arthur West, Ringdove, Geo. Brinckman, Martial, Tommy Keith, Marion, Isabel, Cecil, Phoebe, Goldfinch, Eva, Darkness, E. F. Juncker, Grace, Bouquet d'Or, Admiration, Lady Blanche, Sunshine, Iolanthe, Eurydice, Whisper, Favourite, and Rosalie. 2nd, Mr. C. Turner, with the following, differing from the foregoing:—Mabel, Lady Blanche, Eric, Little Lady, and Captain Boynton, a very fine dark shining maroon variety.

With twelve varieties, ten blooms of each, Mr. G. Humphries was 1st, with capital bunches of Arthur West, Geo. Brinckman, Darkness, Little Duchess, E. F. Juncker, Red Indian, Mabel, Favourite, Whisper, &c. 2nd, Messrs. Paul & Son, with Darkness, Rosalie, Red Indian, Achilles, Admiration, Little Darkie, and others.

Single Dahlias (Nurserymen)—Stands of twenty-four bunches of these were shown in very fine character, Messrs. Cheal & Sons, and M. V. Seale running a very close race for the supremacy, the 1st prize going to the former, who had Duchess of Fife, Annie Hughes, Jas. Scobie, Miss Linnaker, Kitty Lady Whitehead, Miss Roberts, Cleopatra, Victoria, Marion Hood, Duchess of Albany, Formosa, Yellow Satin, The Bride, Lowfield Beauty, Evelyn, Gulielma, Amos Perry, W. C. Harvey, Eclipse, Northern Hero, Duchess of Anhalt, Miss Glascock, and Ruth. Mr. Seale had, differing from the foregoing, Miss Henshaw, Huntsman, Alice Seale, Northern Star, Madame J. Conninck, Florrie Fisher, Alfonso, Miss Gordon, Miss Jefferies, Cleopatra, and Miss Ramebottom. With twelve varieties, Mr. Geo. Humphries took the 1st prize with capital bunches of Eclipse, Mrs. W. C. Harvey, A. Perry, Jas. Scobie, Florrie Fisher, Miss Roberts, Miss Gordon, Cleopatra, Duchess of Albany, Miss Henshaw, Duchess of Fife, &c.

Show Dahlias (amateurs)—The best twenty-four blooms out of six exhibits came from Mr. J. T. West, gr. to W. Keith, Esq., Cornwall, Brentwood, who had good ones of Willie Garratt, Mrs. Gladstone, W. Keith, A. Rawlings, H. Keith, Victor, W. Powell, E. Sherman, J. Walker, Geo. Rawlings, J. Standish, Clara, W. Rawlings, Shirley Hibberd,

J. C. Vaughan, and Sunbeam, self; edged, Majestic, Maud Fellowes, Ethel Britton, and J. T. West; fancy, Matt. Campbell, Frank Pearce, John Britton, and Henry Glascock.

With twelve blooms, Mr. J. Vagg, gr. to J. Theobald, Esq., M.P., Havering, Romford, was 1st, with George Rawlings, J. Rawlings, W. Garratt, Maud Fellowes, Duke of Fife, R. T. Rawlings, W. Rawlings, A. Ocock, T. J. Saltmarsh, Mrs. Gladstone, Mrs. W. Slack, and Prince of Denmark.

With six varieties, Mr. Geo. Boothroyd, Chichester, was 1st, with James Cocker, Ethel Britton, Mrs. Gladstone, Duke of Fife, John Walker, and W. Rawlings.

Fancy Dahlias (Amateurs)—Two classes of these are still retained for the amateur growers. The best twelve came from Mr. J. T. West, who had capital blooms of Henry Glascock, John Britton, Salamander, T. W. Girdlestone, Frank Pearce, Matthew Campbell, Professor Fawcett, John Cooper, Mrs. J. Downie, Buffalo Bill, Egyptian Prince, and Mrs. Saunders.

With six blooms, Mr. T. Anstiss was 1st.

Cactus and Decorative Dahlias (Amateurs)—These were well shown by amateurs, the best twelve bunches of six blooms came from Mr. J. T. West, who had in fine character Marchioness of Bath, Charles Rife, Bertha Mawley, Mrs. Keith, J. Chamberlain, Glory of Brentwood, Blanche Keith, Duke of Clarence, and Seedlings. Mr. E. Mawley was 1st with Duke of Clarence, Bertha Mawley, Juarez, Professor Baldwin, Delicata, and St. Catherine.

Special prizes were offered by Messrs. H. Cannell & Son for six varieties, six blooms of each, distributed by themselves. Mr. J. T. West was again 1st with Edward Mawley, Marchioness of Bute, H. Cannell, Glory of Brentwood, Emily Girdlestone, and Mrs. Keith.

Pompon Dahlias (Amateurs)—With six varieties, ten blooms of each, Mr. J. T. West was again 1st with Arthur West, Mary Kirk, Winnifred, Eva, Tommy Keith, and a Seedling; 2nd, Mr. W. Mier, Ightam, with Whisper, Grace Dora, Prince of Lilliputians, Admiration, and Eurydice. With six bunches, three blooms of each, Mr. S. Cooper was 1st.

Single Dahlias (Amateurs)—With six varieties, ten blooms of each, Mr. T. W. Girdlestone was 1st, with varieties of his own raising, he being the only exhibitor. With the same number of bunches, six blooms of each, Mr. E. Mawley took the 1st prize, he being the only competitor.

Messrs. J. Cheal & Sons offered special prizes for twelve blooms of single Dahlia, six blooms of each, Mr. T. W. Girdlestone, who was the only exhibitor, taking the 1st prize, with The Mikado, Little Frank, Dearest (white, with side edgings of yellow), Prince of Orange, Maize, Marion Hood, Demon, Yellow Dwarf, Sunningdale Scarlet, Cinderella, Andry, and Florence.

In the class for six bunches of fancy single Dahlias, varieties whose blooms are tipped, striped, or edged, Mr. T. W. Girdlestone was 1st, with Splash, Tommy, M. C. C., Phyllis, Howie, and Irene, all fine seedlings of his own; 2nd, Messrs. J. Cheal & Sons, with Mary Sharp, Stars and Stripes, Jas. Scobie, Gulielma, Victoria, and Miss Glascock.

Then followed the following open classes, viz., six blooms of any dark Dahlia: 1st, Mr. J. Walker, with Prince of Denmark; 2nd, Messrs. Keynes & Co., with Niobe. Six blooms of any light, not yellow: 1st, Mr. J. T. West, with Mrs. Gladstone; Mr. G. Humphries being 2nd with the same.

The best six blooms of any yellow, were John Hickling, from Mr. J. Walker; and Mr. G. Humphries was 2nd, with R. T. Rawlings. Mr. Mortimer was 1st with a tipped Dahlia, having six good blooms of Mrs. N. Halle; Mr. M. V. Seale was 2nd, with Mrs. Saunders. The best six blooms of a striped Dahlia were Frank Pearce, from Mr. G. Humphries; Mr. Walker being 2nd with Matthew Campbell.

The best six blooms of an edged Dahlia was Miss Cannell, from Mr. C. Turner; Mr. J. T. West was 2nd with J. T. West. Mr. John Walker offered special prizes for six blooms of his new white John Walker. Mr. Mortimer was 1st.

In the way of miscellaneous collections, Mr. T. S. Ware, Hale Farm, Tottenham, had a large and thoroughly representative stand of Dahlias of all types, effectively arranged; and Messrs. H. Cannell & Sons, nurserymen, Swadley, an imposing stand of Cactus and decorative varieties, set up in fine bunches—also blooms of Begonias, Messrs. J.

Laing & Sons, Stanstead Park Nursery, Forest Hill, had a group of Begonias arranged with Palms, Ferns, &c., and also a representative collection of hardy flowers. Messrs. B. Peed & Son, nurserymen, Lower Norwood, had a group of plants, and also of cut flowers; and Messrs. W. Paul & Sons, nurserymen, Waltham Cross, a large collection of cut Roses, including their new Tea-shaped China Rose, Duke of York.

Novelties.—New show varieties of Dahlias were scarce. Messrs. Keynes & Co. had Niobe, a deep crimson self of good promise. Mr. J. Tranter had Nellie Tranter, a very pretty light variety, edged with lilac-purple; and Mr. G. St. Pierre Harris had Beauty of the Grove, Snowflake, and Charmer; and another exhibitor had A. H. Collinson, and also Mrs. Collinson, all of which will, no doubt, be seen in a more developed character later on. Cactus and Decorative Dahlias were largely produced in new forms. Messrs. Keynes, Williams, & Co. received First-Class Certificates for Lady Penzance, soft clear yellow, very fine; Lady H. Grosvenor, delicate sulphur base, with a bright yellow centre; and Chancellor, bright crimson purple, all true Cactus varieties. First-Class Certificates were given to Messrs. Perkins & Sons, nurserymen, Coventry, for Matchless, a very fine maroon, paling to crimson on the petal tips, and of the true Cactus type, very distinct; and Purple Prince, the base of the petals maroon, tipped with bright-purplish crimson, a true Cactus; to Messrs. H. Cannell & Sons, for Lilacina, a very distinct decorative variety, pale yellow ground deeply suffused with bright pinkish-mauve, very distinct; to Mr. T. S. Ware, for Mrs. A. Pearl, the nearest approach yet seen to a white Cactus type, creamy white, with a bright yellow centre; to Mr. H. R. Pictor, for Beauty of Wilts, bright orange-salmon, very distinct, and pleasing; and to another exhibitor for Mary Hillier, very like Beauty of Wilts, that it would be running a risk to have both in the same stand.

New Pompon Dahlias were shown by several, and First-class Certificates were awarded to Mr. Charles Turner for Captain Boynton, deep shining maroon, very fine shape; and to Rovena, yellow ground, tipped with bright pale red. Pompons: Cere, pale primrose, Sovereign, bright yellow; Midnight, shaded crimson; and Madge, orange-red, tipped with white, are all promising varieties.

New single Dahlias were largely represented. First-class Certificates of Merit were awarded to Messrs. Perkins & Son for Scarlet Perfection, very bright scarlet, excellent shape, and very smooth; they also had Queen of Beauties, orange-scarlet, with a distinct tip of orange on each petal—very distinct; to Mr. T. W. Girdlestone, for Demor, rich bright blackish-maroon, of the finest shape; Phyllis, pale ground, mottled and striped with lilac round the centre, and flaked with crimson; Tommy, yellow, flaked with bright crimson, very handsome; and M.C.C., yellow striped and flaked with bright orange-red; to Messrs. J. Cheal & Sons for May Sharpe, buff ground, reddish-orange round the eye, and flakes of orange-red, deepening to crimson; and Mrs. Harris, blush, with side margins of bright rosy-purple, small, very distinct.

Obituary.

CHARLES VERDIER.—In Mr. CHARLES F. VERDIER, whose death on the 18th of August is announced, the Rose world and French horticulture lose a distinguished and ardent Rose-grower. Associated in early years with his father, Mr. Victor Verdier, in the old garden just opposite the scene of Rosa Bonheur's picture of "The Horse Fair," in Paris, he has died ripe in years and honours. Having known him for forty years, I can but speak with respect of his perfect knowledge of Roses, his care and honesty in the discrimination of novelties, and his worth as a friend and colleague. He had seen the growth and consummation of the race of hybrid perpetuals and of the Teas, and had a fifty-years' Rose experience. His health had somewhat failed in the last three years; but when last I saw him he had planted in his new garden one of the most perfect collections of all the Roses, arranged in their several sections, and was, though not so vigorous as a cultivator, as ardent as ever in his enthusiasm and knowledge of his favourite flower. *George Paul.*

THE WEATHER.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S. Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending September 2, is furnished from the Meteorological Office:—

"The weather during this period was generally fair and dry, but some rain was experienced over Great Britain during the middle part of the week, the fall being heavy at Cheshire and Dungeness.

"The temperature was 1° below the mean in 'England, E.,' and just equal to it in 'England, S.,' but was 1° or 2° above it in all other districts. The highest of the maxima, which were registered on August 30 over England, but on irregular dates in Ireland and Scotland, ranged from 77° in the 'Midland Counties and England, S.W.,' to 69° in 'Ireland, N.,' and 68° in 'Scotland, W. and England, N.W.' The lowest of the minima were recorded during the earlier days of the week, when they ranged from 31° in 'Scotland, E.' (at Braemar), and 34° in 'Scotland, W.,' to 44° in 'England, N.E. and N.W.,' and to 54° in the 'Channel Islands.'

"The rainfall was less than the mean in all districts, the deficit in nearly every case being considerable.

"The bright sunshine was much less prevalent than during the preceding week in all districts, except the Channel Islands. In the Wheat-producing districts the values were less than the mean, but in most of the 'Grazing' districts they again exceeded it. The percentage of the possible duration ranged from 13 in 'Scotland, N.,' and 22 in 'Ireland, N.,' to 40 in 'Scotland, W.,' 48 in 'Ireland, S.,' 55 in 'England, S.W.,' and to 66 in the 'Channel Islands.'"

MARKETS.

COVENT GARDEN, September 7.

MARKETS abundantly supplied. Prices low. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Lettuces, per doz. ... 0 9- 1 0	

POTATOS.

The demand is not equal to the supplies, which are very heavy, except for best samples, which are readily picked up at good prices, 80s. to 90s.; ordinary stuff, 40s. to 50s.; and even at these prices slow trade. J. B. Thomas.

ADDRESSES OF HOME AND FOREIGN SUBSCRIBERS: G. B. We cannot afford the space, nor have we the time, to copy out the addresses of the home firms. You should obtain the Horticultural Directories published at 171, Fleet Street, E.C., and 37, Southampton Street, W.C. We do not think that any list of foreign firms is published here. Enquire at Hachette's.

BLACK HAMBURGH GRAPE: G. W., Crawley. The appearance of the bunch sent indicates over cropping, or an indifferent state of the Vine border. The berries are in every case shanked, but only in a few cases has the sour fermentation of the sweet juices been set up; the colour is not what it should be, being uniformly of a dull red; but, in some kinds of soil that is always so; good flavour usually goes with red Black Hamburg.

BOOKS: J. L. B. There is no book which specially treats of the culture of the Tomato and Strawberry in unheated houses. The culture of these fruits in this manner, is modified forcing, and you will find what information you need in The Tomato and its Culture and Uses, by W. Isgulden, published for Is., at the Journal of Horticulture Office, 171, Fleet Street, E.C.; and Strawberries, by Mr. W. H. Harrison, M.A., published by Simpkin, Marshall, Kent, & Co., London, for 1s.

CANARY CREEPER: A. H. It is the effect of the drought. No disease.

COBBA ROTTING: H. The stem has been injured in some way, and the water having entered, it has decayed.

CORRECTION.—In our last issue (No. 349, p. 279, col. c) the Scotts Patents, for Deansfell read Deans Gate, and for J. J. Scott, read J. J. Stott. In the report of the fruit competition at the Agricultural Hall, Mr. Masterson should have been placed equal 3rd with Mrs. Crawford, of Gatton, gr., Mr. Stogrove.

DANDELIONS ON LAWN: W. T. G. Provide yourself with an earthenware jar of vitriol, and with a pointed bit of stick let fall a few drops of the liquid into the heart of the plants; or make use of the instrument mentioned in our last number, "The Easy Weed Destroyer." The plants will die out completely in a short time; the leaves should then be swept up, and if the bare patches that are left are so numerous as to be unsightly, sow Grass seeds (lawn mixture), or inoculate with little tufts of Grass, by means of a dibble or trowel.

EXHAUSTED ROSE BED: A. J. Z. Dig up the plants carefully in early October, lay them in carefully in soil, separately, not in bundles; those in the middle of the bundles will be dried up. Having done this, throw out most of the soil if you suspect the drainage is bad, and put into the bottom a drain filled-in with stones or brickbats, and lead this to a kind of dry well, also filled-in with the same materials; spread a layer of rough stable dung or kitchen-garden refuse over the bottom, and return half of the soil. Coat this with a layer 6 inches thick, of pig manure, and then fill-in with fresh fertile soil—that is, top spit soil from the vegetable garden or loam from a pasture. Trench it all over, and intimately blend together the various materials, but do not disturb the rough litter, &c., at the bottom. On a dry day, a week or so after digging, level it and trample it evenly all over, and plant out the Roses after slightly trimming the roots, and carefully clearing off all suckers on the worked plants. Do nothing whatever to the bed whilst it is in a wet condition, or it will be spoilt. When winter has commenced, and frost has hardened the ground, put on a slight mulch, packing it round the plants; but this is scarcely wanted if your garden is at the seaside.

GARDENIAS: F. F. There are traces of some grub, which has tunneled into the wood and occasioned the swelling. We will endeavour to tell you more fully about it later on. Meanwhile, we fear there is no cure.

MYRICA GALE: G. B. We never saw this in fruit before, the Ptelea often, and at one time in the Times Office yard!

NAMES OF FRUITS: Mr. Noakes. Pear: Beurri Bosc.—J. W. Large Pear: next week.—J. B. 1, Pear, Peach, Pear. The labels of the Plums got mixed: the red one, Pond's Seedling.—Wm. Logan. Apple: Lord Suffield.—D. M. L. Pear: Williams' Bon Chrétien.—A. E. 1, Duchess of Oldenburgh; 3, Emperor Alexander; 4, Kerry Pippin; 5, Lane's Prince Albert.—K. W. H. Pears: not known; should think gone out of cultivation; small and worthless.—Helen. Apple: Golden Reinette, most probably.—F. B. S. Plum: Jefferson. Cherry: emashed and decayed.—G. E. L. 1, Pitmaston Duchess; 2, Beurri d'Amanlis; 3, Hessel.—F. K. & Co. 1, Achan; 2, Beurri d'Amanlis; 3, Uvedale's St. Germain; 8, Red Quarrenden. The other Apples we do not recognise. They are very probably local varieties peculiar to Scotland.—W. S. L. 1, Beauty of Kent; 2, Gravenstein; 3, not recognised.—G. T. Plum: Automne Comète.—G. G. 1, not recognised; 2, Grenadier; 3, Autumn Pearmain; 4, Gascoyne's Seedling; 5, Keawick Codlin; 6, not recognised; 7, Waltham Abbey Seedling; 8, Yorkshire Greening; 9, Ecklinville Seedling.—W. R. J. 1, Clapp's Favourite; 2, Williams' Bon Chrétien.—J. H. C. Pear: Beurri d'Amanlis. Apple: Wiater's Coleman.—J. G. W. 1, Plum: Diamond; 2, not recognised; 3, Ickworth Imperatrice; 4, Autumn Pearmain; 5, King of the Pippins; 6, Henry Morning.—R. W. 1, Comte de Lamy; 2, King of the Pippins; 3, Beurri Superfin; 4, Williams' Bon Chrétien; 5, Beurri Hardy.—C. Ayres, Capetown. We regret our inability to name Apples grown in South Africa. They are very different in appearance from the same sort grown in this country.—A. C. Next week.

NAMES OF PLANTS: W. S. Dimorphotheca pluvialis.—F. W. K. Artemisia rupestris, Italian form.—A. J. H. Panicum crus-galli, Eragrostis minor.—W. L. Schomburgkia Lyonsii, Lindl., flower white and purple; Epidendrum imbellatum, Sw., flower green; Brassavola sp., flower necessary for determination (no numbers are given by sender).—G. E. 1, Funckia ovata; 2, Tuxodium distichum; 3, Hibiscus syriacus; 4, Sedum spectabile; 5, Rudbeckia Newmannii; 6, Epilobium angustifolium album.—G. H. S. 1, Smilacina oleracea; 2, Oxalis; 3, Chelidonium majus; 4, Echium

creticum; 5, Pellionia pulchra; 6, Passiflora
 suberosa; 8, Epilobium angustifolium album.—
Lotion. 1, Stachya lanata; 2, Sedum telephium; 3,
 Tanacetum vulgare; 4, Chrysanthemum maximum;
 5, Campanula Rapunculoides; 6, Chrysanthemum
 lacustre; 7, Erigeron speciosus; 8, Hieracium,
 not recognised; 9, Nigella damascena.—*F. Y.* A
 garden variety of Ceanothus azureus.—*J. H. W.*
 1, Rubus nutkanus; 2, Polygonum cuspidatum;
 3, Phytolacca decandra.—*L. G.* 1, Aira præcox;
 the fungus is the common Morel, poorly developed.
 —*R. A. K.* 1, Tsuga canadensis, Canadian Hem-
 lock Spruce; 2, Cornus mas. variegata.—*R. C.* 1,
 Chrysocoma Lyncosyris; 2, Pulmonaria officinalis;
 3, Scabiosa caucasica; 4, Achillea millefolia
 rubra; 5, Polemonium sps.—*S. R.* next week.—
H. 1, Spiræa, no flowers; 2, Vaccinium, no flowers;
 3, Polygonum cuspidatum; 4, Leycesteria formosa;
 5, Gnaphalium margaritaceum.—*C. B.* Cattleya
 Harrisonia, Oncidium flexuosum, and probably
 Thunia alba, but the specimen sent had withered.
 —*F. K., Forest Hill.* 1, Alternanthera parony-
 chioides anrea; 2, Alternanthera amœna; 3, Alter-
 nanthera versicolor; 4, Alonœa incisa; 5, Vinca
 oculata rosea; 6, Hibiscus Cooperi.—*Coraline.* 1,
 Aspidium coriaceum capense; 2, Polypodium
 appendiculatum; 3, Polypodium phymatodes; 4,
 Nipholobus lingua; 5, Encomis punctata; 6,
 Zephyranthes atamasco.—*S. Roy.* It is a large
 immature Geaster, and most probably Geaster
 Michelianus, but not well enough developed to
 determine accurately. It is not edible, but has no
 reputation of being poisonous. *M. C. C.*—*C. M. B.*
 Judging by the scrap of a flower sent, it may be a
 garden variety of Nasturtium. You should send
 more materials.

PEARS: *J. S.*, next week. We give time and money
 for work that is not editorial, or within the terms
 of our obligations, in the desire to be useful to
 our readers, but they should pay the carriage of
 their parcels!

TOMATO FRUITS SPLITTING: *W. Jinks.* Excessive
 watering, or affording large quantities of water
 after a period of drought—the latter more probably.

TOMATO SEED: *Interested.* Let the fruits hang till
 quite ripe, or even over that stage; skin the
 fruits, and wash the seeds from the pulp over
 a fine sieve held in a tub of water, which
 will not let the seeds through it, and then
 dry the seeds in an airy place. It retains
 its vitality from four to six years. There is no
 book in our language which will give you just the
 information you want in regard to seeds; but
 MM. Ernst Benary and H. Jager published, in
 1887, through the house of Otto Spamer, book-
 seller, Leipzig and Berlin, a book entitled, *Die
 Erziehung der Pflanzen aus Samen.* This contains
 in concise form a mass of information regarding
 the subject of seed-saving, sowing, and cognate
 subjects.

VERBENA VENOSA: *P. C. H.* From seed which is
 readily obtainable, or root division in the spring;
 the roots being put into boxes of soil, and stored
 in a cold pit at the commencement of winter. If
 the pit has an earthen floor for the box to stand
 upon but little water will be required.

WEATHER FORECAST: *Anxious Reader.* No reliable
 forecast of the weather in this country can be
 made a week in advance. Any attempts that are
 made are by honest but mistaken persons; or, more
 likely, by quacks and gamblers.

WOOD-LICE AND EARWIGS ON WALL TREES: *A. J. Z.*
 Catch them in short lengths of Broad Bean haulm,
 stuck behind the branches; the more traps, re-
 member, the greater the hauls, which should take
 place each morning. The depredators work at
 night mostly. In the winter, syringe the trees
 heavily when sharp frost is imminent, or have the
 wall pointed.

COMMUNICATIONS RECEIVED.—*C. de B., Lierre.*—*W. Wood &*
Sons.—*G. M.*—*J. W.*—Dutch Horticultural Society.—*H. H.*
G. P. S.—*A. M. W.* should have addressed the publisher,
 the editor has nothing to do with the publishing department.

AMATEUR GREENHOUSES.

SPAN ROOF.

THESE GREENHOUSES

are made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy man or gardener in a few hours. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16oz. glass throughout. All parts are uredly packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

Deduct 10 per cent. if required for brickwork.

SPECIAL NOTICE.

Owing to the greatly increasing demand for my Amateur Houses every autumn, and having to refuse so many orders last season through customers not booking their orders early, I have decided to allow a Special Discount of 5 per cent. off the Amateur Greenhouses only to all customers booking their Orders previous to September 16. Please note that on no account will orders be booked after that date under full prices.

Deduct 10 per cent. if required for brickwork.

When ordering, it should be stated at which end the door is required (when facing front of house from outside); if desired, it can be inserted in front.

If William Cooper's Houses are not the Cheapest and Best Value for Money in the Trade, how is it he sends more Houses off in one week than any other maker in one year? Do not be misled by other makers copying my blocks and prices. Call and see the materials used, and the Houses being made. Works cover over 5 acres of Ground.

"INVINCIBLE" HOT-WATER APPARATUS.

Tenant's Fixture.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.

Requires no sunk stove-hole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the Greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all.

Securely and carefully packed on rail at the following respective prices:—

SIZE OF HOUSE.

7ft. by 5ft., £2 15s.; 9ft. by 6ft., £3; 10ft. by 7ft., £3; 12ft. by 8ft., £3 5s.; 15ft. by 10ft., £4 5s.; 20ft. by 10ft., £5 5s.; 25ft. by 10ft., £8 5s.

The following are extra:—Set of Stoking Tools, 2s. 6d.; Cap to Stove Pipe if required, 1s. 6d.

Estimates for complete Apparatus for any sized house, free on application.

IMPORTANT.

I respectfully beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is now in preparation, and will be published in about three weeks, when I shall have much pleasure in forwarding to every person who has applied for a Price List up to August 23th of this year one post-free, and to all persons up to September 16th who send Three Stamps for postage, after which date the price will be One Shilling each, post-free. This List will be the most Complete in the trade, and has cost several thousand pounds to produce.

GLASS.—GLASS.

MESENTER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus. Will be found the most complete, practical, and reliable guide to all about to build, alter, or heat Greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kinds of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price, 2s. post-free.

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country; an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made, and gentlemen waited on in any part of the country. Plans and Estimates free on application.

TO GARDENERS AND OTHERS
SEEKING SITUATIONS.

Advertisers are cautioned against having letters
 addressed to initials at Post-offices, as all
 letters so addressed are opened by the
 authorities and returned to the sender.

RICHARD SMITH AND CO.
 beg to announce that they are constantly receiving
 applications from Gardeners seeking situations, and that
 they will be able to supply any Lady or Gentleman with
 particulars, &c.—St. John's Nurseries, Worcester.

B. S. WILLIAMS AND SON beg to intimate
 that they have at present in their Nursery and upon
 their Register some excellent Men, competent either to fill
 the situation of HEAD GARDENER, BAILIFF, FOREMAN,
 or JOURNEYMAN. Ladies and Gentlemen requiring any of
 the above will please send full particulars, when the best
 selections for the different capacities will be made.—Victoria
 and Paradise Nurseries, Upper Holloway, N.

Gardeners, Farm-Bailiffs, Foresters, &c.

DICKSONS, Royal Nurseries, Chester, are
 always in a position to RECOMMEND MEN of the
 highest respectability, and thoroughly practical at their busi-
 ness. All particulars on application.
 Telegraphic and Postal Address—"DICKSONS, CHESTER."

F. SANDER AND CO. can recommend
 several highly qualified and energetic HEAD and
 UNDER GARDENERS, of excellent character, and proved
 ability; men thoroughly fitted for all the various duties of
 their profession. For all particulars, please apply to—
 F. SANDER AND CO., St. Albans.

TO FLORISTS.—A thoroughly experienced Man in Bouquets, Wreaths, Crosses, and all sorts of fancy Designs, requires situation as MANAGER or FIRST-HAND.—B., 62, Camden Road, N.W.

THE VALUE OF PRAISE, as an incentive to work hard, is well-known to employers of labour. It spurs a man to renewed exertions, for he feels he has a character to sustain. This was the case with the proprietor of Holloway's Pills and Ointment when they were first appreciated by the public. His efforts are still happily successful, and grateful letters, which arrive daily, give evidence of astonishing cures performed. The following recent testimony from Mr. Bradley, Rotherham, Yorks, is a fair sample of thousands of cases. He says, "I suffered from eczema so terribly that it spread all over my face and body. When I was in despair I tried your remedies, and they cured me."

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 16, 1893.

THE RESIN OF CONIFERS.

THE origin and properties of resin in Coniferous timber have recently been investigated by Dr. H. Mayr, and he has succeeded in demonstrating several new and interesting points. The subject is treated rather fully in an article contributed by Dr. Mayr to the *Zeitschrift für Forst und Jagdwesen* for June, and his conclusions, some of which differ from those of previous investigators, are summarised as follows:—

1. Only in an invisible, and thus in the molecular form, in the plasma, can existing resin pass into an intercellular space. Therefore—

2. The cell wall is only permeable for resin so long as it is in process of formation.

3. All resin-canal cells which subsequently belong to the permanent tissue of the wood, not resin secreting, epithelial cells, but partly store cells, as other parenchyma cells, partly secondary meristem cells (thin-walled), are converted after a series of years into permanent cells; therefore, it follows that a secretion of resin in the canals can only occur during the first year or two of the formation of the canal-carrying annual rings.

4. Finished cell-walls, whether lignified, thickened, or not, cannot be permeated by resin so long as the respective walls are saturated by water, and, as in the living tree, both sap and heartwood are always saturated so, it follows that:—

5. All cell-walls of normal wood in the living tree are always free from resin.

6. All resin-holding spaces are surrounded by an impervious, continuous cell-tissue, and, therefore, are completely isolated. The resin cavities are entirely closed in on all sides, and never open at the exterior in an uninjured tree.

7. There is, therefore, no spontaneous exudation of resin towards the surface; every outflow of resin is pathological; where, *primo aspectu*, a spontaneous outflow appears to occur, as on the buds of different Conifers, a close investigation shows that it is connected with exudation into an intercellular space, or with the drying-up of the outer layers, thus in the case of the latter a pathological occurrence.

8. All resin canals of the wood stand vertically over one another, and the horizontal always arise from the vertical; should the place of origin have become lignified with the respective year ring, then the connection between the two forms is effected where the horizontal and vertical canals occasionally cross.

9. With the conversion of sap-into heart-wood, the resin-canals are filled up by tyloses, so that a subsequent flow of resin from the sap to the heart-wood, or *vice versa* (as with the economic extraction of resin), is impossible.

10. The resin must be a bye-product in the formation of coniferin, one of the usually occur-

JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY,

CHELSEA, LONDON, S.W.

ring substances in the resin-yielding Conifers; the resin does not arise from the coniferin, but simultaneously with it, and starch may be considered as the raw material for the formation of both.

11. Neither by normal nor pathological causes (chemical decomposition, or fermentation through fungi) does a conversion of coniferin, lignin, or cellulose (the constituents of the cell-walls), into resin occur.

12. Should a gradual diminution of the watery contents of the cell-wall occur through mechanico-pathological causes (wounds, punctures by insects, &c.), the resin partly takes the place of the water, and can, through unwounded and turgescient neighbouring wood, also fill the "lumina" of the cells. Should fresh wood remain in the ground, as, for example, the stumps of felled trees, the resin is gradually forced by the surrounding moisture into the interior of the stump. Under favourable conditions, as in stagnant water or bogs, the resin occurs in the rotting wood as resin-hydrate in a crystalline form. *A. C. F.*

PLANT NOTES.

HELIANTHUSES.

THE more important autumn flowers are the species and varieties of *Helianthus*, of which there are a large number, differing chiefly in habit of growth. The finest of all is the tall-growing *H. multiflorus maximus*, of which two immense beds are in full bloom near the Palm-house at Kew. This is a striking variety, the leaves large, rich green in colour, and the flowers, though not coarse, are broad, and deep yellow; it grows fully 7 feet in height. The varieties of *H. multiflorus* are very handsome, particularly that called *Soleil d'Or*, which is not of tall growth comparatively, about 4 feet only in height, the flowers perfectly double, and rich yellow; it is remarkably showy. Such kinds as *H. giganteus* are almost too unruly for the garden. Their slender stems rise to a great height, 10 or 11 feet, and the flowers, though small, are carried in profusion. When left to itself, it is very beautiful, the shoots waving about in the wind. The slender flower-laden branches are useful to cut for the house, and for decorations of all kinds. It must be a poor soil and position that will not grow any of the *Helianthuses* well.

CHRYSANTHEMUM GUSTAVE GRÜNERWALD.

This is a very beautiful early-flowering variety, and was shown by several exhibitors at the recent exhibition of the National Chrysanthemum Society. The flowers are similar to those of *Madame Desgranges*, as large, and as plentiful. The colour delicate pink, shading to white. Mr. Norman Davis, Lifford Nursery, Camberwell, exhibited it well, and it is a variety that we welcome for its freedom and beauty. *F.*

THE AUSTRIAN BRIARS.

M. P. HARIOT in the *Journal de la Société Nationale d'Horticulture* has an interesting note on the history of this Rose, "la Rose Capucine." It was, it appears, named *Rosa punicea* by Cornut, *Canadensium Plantarum Historia*, p. 11 (1635). In 1640, Parkinson, *Theatrum Botanicum*, figures the plant as *Rosa sylvestris austriaca flore phoeniceo*, the vermilion Rose of Austria. In 1770, Jacquin mentioned the same Rose under the name *Rosa bicolor* (*Hortus vindobonensis*, p. 1, t. 1), but avowed his ignorance of its origin. M. Hariot goes on to say that the copper-coloured Austrian Briar is simply a "sport" or bud variation from *Rosa lutea*, a plant figured by Dalechamps so long since as 1587, and asserted to be a native of Asia Minor, Armenia, and Persia. In 1720 Boerhave recorded the existence in

the Leyden Botanic Garden of a Rose, one of the branches of which bore yellow Roses, whilst all the rest were of the copper colour of the Capucin Rose. Thory recorded a similar circumstance, and this year M. Hariot himself found on two plants of the Austrian Briar branches bearing only yellow flowers.

In strict accordance with priority, M. Hariot calls the plant *R. punicea* of Cornut. He would have done better to have written *R. punicea*, Miller, ex Corant, for Cornut wrote long prior to the establishment of the binominal system of nomenclature; or, better still, as the plant is proved to be a mere form, to have written *R. lutea* var. *punicea*, as Lindley did in his *Rosarum Monographia* (1820), p. 84. In the *Botanical Magazine*, t. 1077, the plant in question is called *Rosa lutea*, β *bicolor*, and Jacquin is there cited as having at first considered the plant to be a distinct species; but observing it afterwards to bear sometimes flowers that were yellow on both sides, he changed his opinion. Parkinson also considered it a variety of *lutea*.

Gerard, p. 1084 (1597) mentions—"The yellow Rose which (as divers do report) was by art so coloured and altered from his first estate by grafting a wilde Rose upon a Broome stalke," but he goes on to say that he has "found the contrarie by mine owne experience"!

The mention of the Rose by Corant (not Cornuti, as generally but erroneously written) in a history of Canadian plants might mislead the incautious were they not reminded that Cornut appended to his work an "enchiridion" containing the names of plants growing in the vicinity of Paris. We have, however, not seen Cornut's work.

Rivers says the yellow Rose produces copper or red as well as yellow flowers; but, strange to say, though the flowers are invariably single, yet they never produce seed in a wild state, and "in this country . . . it is with extreme difficulty, and only by fertilising its flowers, that seed can be perfected; if the flowers are examined, they will all be found deficient in pollen, which accounts for this universal barrenness." If this be true in other countries, it might lead to the inference that the species is dying out. Another fact tending in the same direction is the circumstance that the yellow Rose, and more especially the copper-coloured variety, will not thrive in the vicinity of London, being in this respect apparently more sensitive than other Roses, none of which can be said to be good Londoners.

THE ROSERY.

ROSES IN SEPTEMBER.

As a rule, when September arrives we can generally speak of the Rose season as past; that is, with the exception of a few stray flowers. This year, however, we are having quite a feast of Roses, and they look like lasting well into October. Taken altogether, I think we may look upon 1893 as having been a fairly good season for Roses. They were in bloom particularly early, many walls and fences being a mass of colour during April and May, and although the unusually hot and dry weather through June and July reduced the quality of summer Roses, we were amply repaid for this in the splendid autumnal display, still with us. Personally, I much prefer an extended season like the present, to a glut from mid-summer until the second or at most third week in July.

The Rose exhibitions were much handicapped by the weather, and with the exception of those stands from Yorkshire, I did not notice anything remarkable at the Metropolitan show of the National Rose Society. There were a few good blooms in some of the stands, but they were very far between. *Madame Cusin* was good; so, too, was *The Bride*. Among the H.P.'s, *Horace Vernet* has come more prominently to the front than any other. Seen in the form Messrs. Harkness & Sons have exhibited it this season, it is one of the finest of dark Roses. But how long will it be ere we see it shown in such form again? This is a peculiar Rose; always good with some, and seldom producing

a bloom of any merit with others; indeed, many find a great difficulty in persuading it to live over the second year. Mr. Mawley tells me that his plants are perfect bushes, and I have noticed that he almost always includes *Horace Vernet* in his stands; while more than once he has gained premier honours with six of this against any other variety of dark Rose. With me, it is useless unless grown as a maiden on the Briar, and afterwards cast away. Under this treatment I can sometimes secure a fairly good bloom.

We often find a grower recommending one Rose over all others, much to the surprise of his brother rosarians. With one it is *La France* (a wretched thing with me), another *Madame Lacharme*, and so on. Roses are of such different types and characteristics, that there are sure to be some which will thrive better in one locality than another. Countess of Oxford seldom comes good with me; but, strange to say, its sport, *Pride of Reigate*, invariably produces heavy and shapely blooms. Among a few of the best Roses this season, I may mention Dupuy Jamain, Suzanne M., *Rodocanachi*, *Alphonse Souperet*, *Horace Vernet*, *Her Majesty*, *Gustave Piganeau*, *Duchess of Bedford*, and *Duc de Montpensier*. Among Teas and Noisettes, *Innocente Pirola* and *Ernest Metz* have been most remarkable with me.

As the cool, dewy mornings of autumn approach, we find much more colour in the dark varieties; while such Teas as *Marie Van Houtte* have been highly coloured on the edges of their petals. Mildew has not been nearly so common as usual; doubtless, this is owing to the long spell of warm weather, when the temperature was more uniform than we are generally favoured with. Now, however, colder nights and mornings are bringing it on apace. Red-rust, another autumnal disease that is often very destructive among the Hybrid Perpetuals, has not attacked one of my plants. When shall we understand this pest? It does not attack the true Teas and Noisettes, but it does the so-called Hybrid Teas; while beds of Hybrid Perpetuals are suddenly denuded of all foliage by it. Ulrich Brunner, Gloire Lyonnaise, and Duchesse d'Autriche, seem the least affected with me.

It would be worth while to encourage the introduction of dark-coloured Teas, if only to secure dark Roses free from red-rust. Like many of my friends, I cannot help feeling that deep-coloured blooms detract from, and break up the softness of colour-tones and chasteness we have always associated with a box of Teas and Noisettes; but if we can secure the colours of the H.P.'s with the greater floriferousness of the Teas, surely a great advance will be made. Year by year we seem to be approaching this nearer.

Single, and what are by the National Rose Society styled garden Roses, have been well shown, and seem to gain in popularity. Such favourites as the best of the Hybrid, Sweet Briars, *Bardon Job*, Paul's single White, *Rosa macrantha*, and many of the sweet little Polyanthas are likely to be extensively grown. But why call them garden Roses? Mrs. J. Laing, Viscountess of Folkestone, General Jacqueminot, and Augustine Guinoisseau are my ideal of garden Roses. These flower very freely, grow well, and will thrive in any soil or position.

Not the least among the beauties of Roses this autumn are the numerous berries of the *Rugosa* or Japanese section; also those of *Rosa pomifera*, and the sweet Briar. The former are always good. Early, mid-season, and late, we can find handsome green foliage, showy single blooms, and trusses of berries, that are admirably adapted for decoration. They are among the last to shed their leaf, are never affected by mildew or red-rust, and when grown in pots, and removed to a cool greenhouse late in the autumn, will retain their beauty until Christmas. I use them largely for Christmas decorations. We shall very soon be busy with planting, mulching, &c. I do not remember seeing the plants with better growth for passing through a severe winter, or with harder and better matured wood for next season's bloom. The drought has reduced the length of many climbers, but it has caused what is made to ripen thoroughly. A smaller quantity of well-

matured wood is preferable to so much rank growth. I shall very soon commence planting my dwarf H. P.'s, especially those growing upon the Manetti. If done early, the roots get a slight hold previous to hard weather setting in. This is an advantage. If we lift a plant and lay it in for a few weeks, we shall find that it makes a quantity of new roots. How much better it would be if these were in established quarters, and what a support they must be against dry winds; the plant being able to derive moisture and sap to maintain the wood in a plump condition. My practice is to plant early, while the ground is still warm; or else leave it until February or March, choosing the first favourable opportunity in these two months.

The question of what stock to purchase plants

of about a dozen species, has long been in cultivation in this country. It belongs to Ericæ, and the species the subject of our illustration has white flowers, which appear in September and October, succeeded by rough globular fruits, ripening the second year. These at a distance resemble Strawberries, and although edible they are not pleasant, and it is said that they possess narcotic qualities.

It is cultivated as an ornamental evergreen shrub, and grows from 15 to 20 feet high, of a close, compact, rounded form of growth, and likes a warm, well-drained soil—if sandy and peaty so much the better; and a position somewhat sheltered, it not being hardy in the colder parts of Britain—or at least it does not attain its full proportions in them. It is an admirable shrub for gardens near the sea that are not exposed to the full blast of the water.

they are reflexed; the colour, too, is several shades lighter. This, perhaps, after all, is immaterial, as the major variety (so-called of catalogues) is now grown far more than the other, but still not nearly enough for general purposes. The mistake that many growers commit is in not making a free use of the knife in the early spring, before growth commences. When once a good-sized plant has been obtained in bush-shape by repeated pinchings, then pruning every season should be the rule, only allowing extension for further increase in size; but then even a moderate pruning is better than none at all. To treat this plant, as some do, as a semi-climber is altogether wrong. I have seen it thus trained on trellises, large plants, it is true, but with a deal too much wood laid in ever to flower well.

FIG. 54.—*ARBUTUS UNEDO*, IN THE GARDEN AT BALCARRES, COLINSBURGH, FIFEESHIRE.

upon, is sure to cause a little doubt with many; but they may safely leave this question to the tradegrower, who will naturally grow each class and variety upon the one he has found most suitable to it. No one stock will suit all Roses equally well, and the soil also has to be taken into consideration; therefore, if when ordering, purchasers would give a few particulars, and then trust their order to a good firm, with a reputation at stake, they would be far better satisfied with the results. *A. P.*

ARBUTUS UNEDO AT BALCARRES.

Our illustration (fig. 54) depicts a fine example of *Arbutus Unedo*, the Strawberry Tree, growing in the Earl of Crawford's garden at Balcarres. We need scarcely remind our readers that the *Arbutus*, a south European representative of a genus consisting

A. Unedo is the stock most commonly employed on which the other species of *Arbutus* are inarched.

We are indebted to the kindness of Mr. Tate, the gardener at Balcarres, for the opportunity of figuring this plant.

A GOOD AUTUMN-FLOWERING STOVE PLANT.

RONDELETIA SPECIOSA MAJOR COMPARED WITH THE SPECIES (*R. SPECIOSA*).—This form of *Rondeletia* is much superior in every way when once its treatment is understood. Under ordinary culture it would not possibly flower so freely, being of more robust growth. I have often wondered if the two really are not distinct species. That now under notice has its leaves wider, and not so pointed, whilst they are also of a paler colour; the flowers are borne in larger trusses, but the petals are flat, whereas in *R. speciosa*

It is recommended in one catalogue, at least, as a pillar or wall-plant; this, too, is wrong if the flower is to be the essential feature of the plant. The bush form is far the best way of treating it, and this can only be arrived at by shortening the growths so as to make them self-supporting. Thinning out the weakly wood in conjunction with this will be a good plan also. In form the pyramidal is better than any other for general purposes.

The plants after flowering should be dried off gradually, as in the case of an *Allamanda* or a *Clerodendron*; in due course the leaves will fall off, but this is an advantage rather than otherwise, from the point of cleanliness. To treat this *Rondeletia* as one would an *Ixora* is a mistake; the latter plant will not bear a dry course, the *Rondeletia* will, and be all the better for it. It will be found safe to expose the plants to a slightly lower temperature after flowering, but nothing lower than that which

is safe for a *Clerodendron*, viz., 55° minimum. It is best when treated in a similar way to these other plants in the spring as to starting into growth and temperature, and with no reduction in the size of the ball. The roots are so extremely fine, clustering in such numbers around the sides of the pots; to take these away means a check to the plants, with a correspondingly weaker start into growth. All that is needed when a fresh potting is not really essential, is a top-dressing. Every other season, or once in three years, will be quite often enough to shift into larger pots; as growth commences, let the plants have all the light possible, to prevent the shoots from drawing up weakly. Watering must be increased gradually, until it is seen that the roots and growth are quite active; then, when a plant is in good condition as to soil, the *Rondeletia* will take quite as much water as an *Allamanda*. As soon as the flower trusses are seen to be forming, weak manure-water will be an assistance, thence onwards until the flowering period is passing by; the supply of water should be more after the manner of *Chrysanthemums* than anything else.

About May, or early in June, at the latest, the plants should be stopped simultaneously all over, no shoot being missed, taking the points out just above the last pair of leaves that are nearly developed. By this stopping, two shoots will be produced in place of the one, and sometimes more; besides which, the back buds are strengthened for another spring's break into growth. With a few plants it is easy to thus regulate the flowering season. It takes from fourteen to sixteen weeks to bring a plant into flower from the time of stopping; thus, if a plant be stopped about the first week in May, it may be had in flower by the middle of August. The season of flowering for this *Rondeletia* may be easily extended over at least two months or ten weeks from the first week in August until the third week in October, by adopting this method of stopping. It is this stopping which so much increases the floriferousness of this *Rondeletia*, as well as that of the old *R. speciosa* also; yet this fact does not seem to be grasped by the majority of plant-growers. At the late summer and autumn shows one rarely sees it recorded that *Rondeletia speciosa major* is a noteworthy plant in any collection, yet when well-grown and freely flowered, an *Ixora* even must be in the finest possible condition to surpass it in point of merit. As a plant for home use also it is extremely useful, alike as it is seen in flower as well as for cutting. Under the pruning treatment, this cutting process never does any harm at all. In a cut state the flowers last well, and are, by reason of their colour, quite distinct from anything else. In regard to soil, there is nothing to surpass the best quality of peat of that kind and quality that one would select for *Ericas* or New Holland plants. Firm potting is of the utmost importance. To the peat should be added silver-sand and some nutty charcoal. Large shifts are never desirable. H.

ORCHARD-HOUSE TREES.

The fruit trees cultivated in pots, and exhibited at the Agricultural Hall, Islington, by Messrs. T. Rivers & Son, Sawbridgeworth, Messrs. Bunyard & Co., Maidstone, and Messrs. W. Paul & Son, were sufficient evidence of the value of orchard-houses for producing first-class fruit in quantity. One has to look at the cultivation of fruit trees under glass from several points of view. The utilitarian aspect may be placed first, for fruit is mostly grown to be eaten; and unless fruit of superior quality can be obtained from fruit trees, the primary object of the cultivator is not obtained. There is another aspect of the question which to some may be even of more importance, and this is the pleasure to be derived from seeing the trees go through their periods of blossoming, setting, and the stages of development until it is fit for eating. The fruit-cultivator soon becomes acquainted with all the above details, and learns the exact kind of treatment his trees require

at the various stages of growth. One may inquire, Where does the pleasure come in? To this I reply, where is the pleasure of growing *Anricules* or *Carnations*? The amateur is satisfied to grow his plants, and attend to them day by day, and often at unseasonable hours at night, for the sake of the pleasure of a month or less of bloom; and does not the fruit-tree cultivator have his season of bloom lasting for more than a month? The lovely pink tint of the Peach and Nectarine blossom, the Cherry trees laden with flowers of the purest white, and best of all the delicate blush of the Apple blossoms. The late Mr. Thos. Rivers recommended rapping the trees daily with a stout stick when in blossom, but I found this injured the bark, unless it is done carefully, so I shook them by hand to disperse the pollen; or those that are shy of setting are touched with the pollen from a free-setting variety. For instance, if the pollen is taken from Royal George Peach and carried to the stigma of such an one as *Exquisite*, the chances are that the latter will bear a full crop, whereas, if it is not attended to, it might fail; but as a rule, if the trees are gently shaken daily, the pollen is sufficiently distributed. Very soon after the blossoms pass away, attention has to be given to disbudding, and also thinning-out the fruit, which in most instances sets so abundantly that it is necessary to remove at least five-sixths of it, and the growths are likewise far too numerous. These may be thinned-out in the early stages of their growth, but the final thinning of the fruit must be left until the stoning period is reached. Before the stoning period commences, much has to be done in the way of stopping the young growths. The most vigorous growth is made at the top of the trees, and the shoots there require stopping first; the check they receive gives the lower growths a chance to develop more fully. All this attention to the trees is a healthful occupation to an amateur. By-and-by the time of the ripening comes round, which is another source of interest. Gardeners and others complain about the labour involved in watering, and, of course, one must look at the disadvantages as well as the advantages.

From the beginning of May until the fruit ripens in July and August, watering and syringing must be very carefully attended to, and the fact cannot be disguised that the trees require daily, and on very hot days, hourly attention—for, if any of the trees suffer for want of water, high-class fruit cannot be expected; but every grower of high-class produce, be it flowers, fruit, or vegetables, has to bestow great care upon them. Take *Chrysanthemums* as an example. I have grown *Chrysanthemums* for the production of very large blooms, as well as Peach and Nectarine trees at the same time, and have no hesitation in saying that it costs less to produce a first-class Peach or Nectarine, than it does to obtain a first-class bloom of a large-flowered or Japanese *Chrysanthemum*; indeed, an amateur, who also stands high as an exhibitor of *Chrysanthemums*, informed me that he estimated the cost of the production of his large blooms of *Chrysanthemums* at a shilling each.

Of course, the healthful occupation of gardening ought not to be measured by pounds, shillings, and pence; but as some persons insist upon taking it this way, their objections have to be met. Gardening has been well described as "the purest of human pleasures, and the greatest refreshment to the spirit of man," and I have no hesitation in saying, after twenty-five years' experience, that orchard-house culture of fruit trees in pots is one of the greatest pleasures of gardening. I like to start with them at the beginning, not exactly in the bud state, but after the trees have made a year's growth. The trade will supply these "maiden" trees, as they are termed, at a reasonable price. They should be planted in 9 or 10-inch flower-pots in November, and the flower-pots should be plunged over the rims out-of-doors. I use cocoa-nut fibre refuse for this purpose, or spent tan answers as well. In early spring the trees are pruned, and placed in a glass-house, where they make

fine growth the following season; by being pinched once only, the growths become studded with flower-buds, and the pots packed full of roots. These young trees, remember, only two years' growth from the bud, will produce fruit the following season, good enough to beat in competition the best productions of the most princely gardens in England. All that is required is attention to the wants of the plants, and they are not exacting except for the three months from the setting of the fruit, until it arrives at the ripening stage. The best potting compound for fruit-trees in pots is good fibrous yellow loam, three parts; add to it one part decayed stable manure, and to every barrow-load of the compost, a seven-inch potful of bone dust. Drain the pots well, and ram in a mixture around the roots quite firmly. Besides this rather rich compound, three surface-dressings should be made in the summer, and for this, although I have tried several, none are better than that recommended by the late Mr. Rivers in the early years of Orchard-house culture, viz., one part malt or kiln dust, and one part of horse-droppings scraped from the roads. The two are thrown together, and made moist by water drained from a dung-hill. The material heats violently, and should be turned over every day, until most of the heat has subsided. Mix enough to last the season. The first dressing is put on when the blossoms have passed away, and it is seen that the fruit has set; another dressing may be given at the beginning of the stoning period, and the last when the fruit begins to swell after stoning. The formation of the kernel inside the fruit occupies about six weeks, and during that period there is little or no appreciable difference in the size of the fruit, and those who have not experience in stone-fruit culture are sometimes fearful that something is wrong. After stoning, the trees take abundance of water over the leaves and at the roots. A Pine-house temperature is not too much, if there is plenty of moisture. Syringing is necessary to keep the trees free from insect pests, especially that tiresome parasite, red-spider.

At p. 236 of the present volume there is a good list of the best varieties to cultivate, and other useful information of a general character, by Mr. Divers, who, by the way, doubts whether pot culture of fruit trees would pay the market grower so well as if the trees were planted out, and trained to a trellis. Market growers are not slow to find out which way pays best, and I, for one, would not dispute with them about it. Amateurs who garden for pleasure would do well to keep the question, "Does it pay?" in the background. J. Douglas.

[We ought to allude here to one aspect of the practice of growing hardy fruits under glass, which escapes the ken of southern growers with their finer climate, &c., and that is, the existence of places in Yorkshire, Durham, Northumberland, and other cold parts of England and in Scotland, where Pears, Apples, Plums, let alone Peaches and Apricots, cannot be ripened out-of-doors, although the trees may make fair growth. Sometimes, as at Lambton Castle, Durham, where the deleterious fumes of the numerous smouldering heaps of slack at the twenty different collieries around prevent it; and sometimes it is climatic influences that work against its accomplishment. In such unfavourable cases orchard-house culture in some form or another becomes a necessity, for it is found that the kinds of fruit that will not succeed on the best of aspects outside furnish excellent returns under glass, and the fruit is handsome, well-coloured, and large. The number of trees need not to be a large one, for one Pear tree, for instance, will produce at least three dishes of fruit, i.e., ten or a dozen trees would carry the supply of that kind of fruit through a month of thirty days. Multiply thirty by seven, the number of months Pears are in season, and you have the required number. Given a house 100 yards long by 10 yards wide, we have a 1000 that would very well accommodate the 700 or 800 trees of all kinds required, besides having cordons on the rafters. Ed.]

PARK HILL, STREATHAM.

ON breezy Streatham Hill, a few miles from the smoky metropolis, is the residence of Henry Tate, Esq., whose munificent bequest of his splendid pictures to the nation was recently made known. The house commands lovely views of Surrey scenery, and from the fine terrace, gay with many vases of flowering plants, the eye stretches over a picture of beathland, Epsom Downs, Thornton Heath, and surrounding country—a noble view, that reminds one of the scenery from Reigate Common.

The garden is not of large extent, but thoroughly well kept. An atmosphere of order and good management pervades the place, stove plants, Ferns in particular, fruit, and Chrysanthemums being amongst the chief things of interest to the gardener, and Mr. Howe, who has care of them, wins many first prizes at leading exhibitions, not only in the district, but at the more pretensions metropolitan displays. The terrace is planted with a great variety of bedders, and good effects are derived from the judicious contrasts of colour; whilst the ground from here dips considerably to a small lake in the bottom, near a rocky constructed by Pulham. In a leafy sheltered nook, a quiet retreat on a summer day, *Anemone japonica* is planted largely, and its white flowers present a pleasant effect against the surrounding shrubs. Here also Palms flourish without protection, but even in the most favoured spots Palms are scarcely satisfactory in England.

Park Hill is richer in indoor plants than those in the open air, although the space at disposal is made the utmost use of; and at the entrance to the carriage-drive a huge pyramidal Pelargonium—at least, many plants joined in its construction—makes a mass of gay colour. This pyramid is upwards of 14 feet in height, not exactly pretty, but giving plenty of colour at a suitable position. Years ago this style of gardening was much in fashion, but a healthier taste has since arisen. We do not condemn the pyramid here, as it is difficult to get such a rich surface of flowers in another way. The house adjoins ferneries and a large structure for Palms. We venture to think that Park Hill will hold its own well against many of the finest English places for Ferns and Palms. The corridor leading to the dwelling rooms is gay with a rich variety of *Celosias*, *Streptocarpuses*, and *Campaula isophylla alba*, one of the finest of all basket or pot plants. Earlier in the season the *Fuchsia* adorns this corridor, and many of the leading varieties are grown. It is impossible in reasonable space to deal at length with the many features near the residence. The "flower house" is a mass of bright colours, and we were especially struck with the good plants of *Celosias* and tuberous *Begonias*, two things that should be grown largely for making a display at this comparatively dull season of the year. One house is devoted to *Lapagerias*, and a number of seedlings are in bloom which show a departure in colour from the normal type. The Palm-house is crowded with huge specimens of such well-known kinds as *Seaforthia elegans*, *Phoenix* in variety, *Cibotium princeps*, *Kentia Fosteriana*, and many others. It will be remembered that Mr. Howe won the first prize at the recent show in the Agricultural Hall for two Palms—splendid specimens of *Seaforthia elegans* and *Kentia Fosteriana*. The fernery is filled with choice specimens, *Adiantum cuneatum* being in superb masses; and other species of note were the large-fronded *Marattia elegans*, a very handsome Fern; *Goniophlebium subariculatum*, and a host of *Adiantums*, such as *A. æmulum*, *A. concinnum latum*, *A. Weigandi*, *A. Williamsi*, and *A. tenerum*. A Fern grotto, so to speak, runs off from the Palm-house, and the fine-leaved *Begonias* luxuriate in the cool, moist, and shady surroundings.

In the grounds, the plant-houses are numerous—in fact, this is essentially a glass-house garden, in which Mr. Howe grows the fine fruits, vegetables, and plants seen at exhibitions. The Orchid-house contains an assortment of *Cattleyas*, and the cooler department some of the largest masses of *Cypripedium insigne* in variety we have seen for years. *Crotons*, *Dracenas*, and *Allamandas* are the chief

features of interest in the stove, and the foliage-plants are remarkably well coloured. Of *Crotons*, the more important are the varieties *Queen Victoria*, *Lord Derby*, *Sunset*, and *angustifolius*. *Allamanda Schottii* and *A. nobilis* were in bloom—the latter a very beautiful kind, the flowers clear yellow, a refined pleasing shade. *Poinsettias* for Christmas decoration are grown in large quantities; and the pits are filled with splendid batches of *Primula obconica*, *Cyclamens*, *Chinese Primulas*, *Eucharis*, and *Pancretiums*. The plants of *Primula obconica* are good in every way, growth and size of flowers. Evidently careful selection has been made over a number of years of the best varieties, the flowers approaching in size almost those of the *Chinese Primula*, and varying in colour from rose to white. One variety was pure white, and a beautiful flower for cutting as well as for the plant-house. Largely grown for table decoration are the various kinds of *Asparagus*, and one in particular deserves mention, *A. deflexus*, which is quite distinct from the more popular species, such as *A. plumosus*. *A. deflexus* is more suitable for pots, the trailing, deep green shoots hanging gracefully over the sides, and, when cut, are very pretty arranged on the table.

Chrysanthemums are represented by a large collection of plants in finest health. The flowers from Park Hill are to be seen at many exhibitions in murky November, and there is every promise at present of rewards in the coming season. One variety named *Felix Casagneux* was in bloom, and sufficiently so to be worthy of note. It is a very fine Japanese variety, with flowers of a golden-yellow colour.

FRUIT.

The largest department is devoted to fruit, and the vineries are numerous, whilst, what is of more importance, the *Grapes* are superb. One lean-to house is planted with *Black Hamburgh*, and the best *Vine* was lifted twelve months last Christmas, kept out of the ground through unavoidable circumstances a week, and then planted. It is in splendid health, and carrying a crop of highly-finished bunches. We notice here that the berries of all the *Grapes* are not only individually large, and the bunches well-proportioned, but the colour is faultless. *Gros Maroc* is not a great favourite, but the *Grape* is pleasant to look at, and tells in a collection at the exhibition or on the table; its quality, however, is not in keeping with its inviting aspect. One house is devoted to *Madresfield Court Muscat*, and the bunches are in every way satisfactory, not shrivelled, or wanting in finish. Perhaps the finest house is that of *Alicante*, and one *Vine* fills the entire structure, which is about 35 feet long. We have visited many gardens in recent years, but never met with such a *Vine* of this variety. It has, in some years, carried one hundred bunches, but of late this number has been reduced. Each bunch averages about 3½ lb. in weight, some turning the scale at 5½ lb. This is not all, for the colour and finish deserve highest praise, as may be judged from the heavy clusters cut from this *Vine* at exhibitions. The *Muscat*-house is about 70 feet long, and the same good cultivation is evident here as in other structures, whilst there are a number of early houses.

Peaches and *Nectarines* are as interesting a feature almost as *Grapes*; one is taken to a long lean-to structure, healthy trees are on the back wall, but in front *Tomatoes* are grown most successfully; the two leading varieties are *Lady Bird* and *Perfection*, both solid, handsome fruits, of first-rate quality. A second early *Peach*-house contains fine old trees of *Royal George* and *Grosse Mignonne*, and a smaller house is filled entirely with the last-mentioned variety. A lean-to fig-house is of interest, as it is occupied with a tree of the *Brown Turkey* variety, now bearing its second crop.

Separate houses are devoted to distinct kinds of fruits, and a small structure is planted with *Cucumber Lockie's Perfection*, the only kind, we believe, grown here. This is fast superseding the old *Telegraph*, and is a free-bearing variety, the fruits solid, smooth, and of good quality.

Although, as we have already mentioned, the

gardens are not of remarkable extent, every inch of space is made good use of. The outdoor fruits, especially of *Apples* and *Pears*, are a distinct success. Many of the trees are on the *Paradise* stock, and bearing heavy crops of clean, handsome, well-coloured produce. Of *Apples*, a tree of *Baumann's Red Winter Reinette* is loaded with fruits of brilliant colour, and other varieties worth mentioning are *Cellini*, *Lord Saffield*, *Stirling Castle*, *Alfriston*, and *Nelson's Glory*; and of *Pears*, *Fondante d'Automne* is the favourite variety; he who prefers this luscious *Pear* is no bad judge of fruit. *Louise Bonne* of *Jersey*, *Glou Morceau*, *Beurré Diel*, and *Marie Louise* are the other chief kinds.

From the foregoing notes of this beautiful suburban place, it is unnecessary to write that the garden is well-managed in every respect, and we may mention as possibly of interest to readers, that Mr. Howe has been gardener here nearly twenty years. *Visit.*

OUTDOOR PEACHES.

I NOTE a favourable reference made to the out-of-doors *Peach* crops at *Barham Court Gardens* on p. 207, and another as to the success attending their cultivation on a west wall. My opinion is that far too much stress is laid upon having south walls for *Peaches* in south-country gardens. Many gardeners consider it to be absolutely necessary to have south walls for *Peaches*, or it is useless to attempt to grow them out-of-doors. While admitting that a south wall offers the most advantages, taking one season with another, I am content to have walls that face west as well, and what may appear still more remarkable to some, an eastern aspect. I know some gardeners do not believe that the *Peach* can be successfully cultivated against a wall facing east; but it can be, and is done, in spite of bad seasons. I have to-day (August 22) gathered two dozen of really good fruit from a tree of *Royal George* growing against an east wall 8 feet high, and much exposed. This was only a small part of the crop, several dozens having been previously gathered. Against another east wall in this garden, a tree of *Princess of Wales Peach* is carrying a full crop of large fruits; and an *Etruge Nectarine* alongside of it is heavily laden with finely-coloured, good-sized fruits. Capital crops of both *Alexander*, *Grosse Mignonne*, and *Dymond Peaches* have been gathered from young trees on a wall facing west. In all these cases there has been a depth of colouring of the fruit which always accompanies good flavour, as I believe the one is governed by the same cause as the other, viz., plenty of sunlight. From trees on open walls we have had a succession of ripe fruit since the last week in June, commencing with *Alexander*, followed by *Early Louise* and *Hales' Early*. These last two *Peaches* are much superior in regard to flavour to the first-named variety, especially *Hales'*, which is one of the best early varieties out-of-doors. A tree of *Grosse Mignonne Peach* planted on a wall but 8 feet high afforded 300 well-coloured fruits of a reasonable size. *Walburton's Admirable* was ready on a south wall in the third week of August. The season of 1893 has been an ideal one for open-air *Peaches*, if water was abundantly supplied at the proper time. The trees have revelled in the strong sun-heat, with good root-waterings and mulches of stable-dung. I gave the trees a nightly washing with tepid water to prevent the spread of red-spider, and cool the bricks and foliage. Where failure to ripen out-of-door *Peaches* occurs, it may generally be traced to faulty methods of pruning, or to an unsatisfactory state of the roots, these being either too deep, the soil too loose in texture, or manure too liberally applied. Bad pruning has much to answer for. The best of all seasons for this operation is soon after the fruit is gathered, then there is sufficient time for the proper ripening of the current season's shoots; for where the leaves of one branch overlap entirely those of the shoot below it, but poor returns can follow. I think that the roots of the *Peach* and *Nectarine* should be limited to a certain area. At a distance of 4 feet from our *Peach* wall

there runs a border of herbaceous plants, and these are taken up periodically, the soil deeply trenched, and all Peach roots found in it are cut off to the feet limit, and these trees never have long roots devoid of fibre. A visit paid a year ago to an enthusiastic amateur gardener, who said that his Peach trees were dying, revealed some ignorance as to the wants of the trees. I learnt that upon the approach of winter the trees were protected by sheep-hurdles placed against the walls, covering these with dry Bracken, the covering remaining till there were observed signs of returning life in the trees. Subjected to this treatment, it was no wonder that the trees were dying. Too many gardeners crop the soil too close to the trees, for the vegetable crops impoverish the soil, and drain its moisture too freely away, to the detriment of the trees. Peach trees in some gardens and soils suffer from lack of water at the roots during dry weather, and more attention should be paid to this matter. *E. M.*

PEDIGREE OR GRADE RACES IN HORTICULTURE.*

BY HENRY L. DE VILMOBIN, PARIS.

(Concluded from p. 301.)

HOW HEREDITY WORKS.

ALTHOUGH heredity is an ever-present and active agent in the transmission of qualities and characteristics in organized beings, its mode of action is not so simple as at a first glance it might seem to be. That like breeds like is a commonly admitted fact, but the like must be taken in a rather broad sense, and the fact that some differences may occur between the parent and the offspring is at the bottom of all improvement of plants by selection.

A being born from one or two of the same kind will be like his parent or parents. But if the parents, although of one kind, were not exactly like one another, how will the descendant look? Will it take after the one or after the other, or blend the features of both? And again, if each of the parents comes from two different ancestors, which of the four will take the lead in the form and character of the new being?

The network of lines of attraction which would induce a living organism, plant or animal, to be like every one of its ancestors can scarcely be unravelled. Still, the consideration of the various influences acting on an incipient organism can be pretty accurately summed up in direct heredity, which tends to make the new plant or animal to resemble its immediate progenitors, and atavism, which induces it to be like the mass of its removed ancestors. I omit for the present the idiosyncrasy, which is the tendency in the new plant to combine the inherited characteristics in some special manner adapted to its own particular wants. If the parent was like its progenitors, then all the influences work the same way, and there is every chance of perfect fixity in the series of beings born in succession. But if the progenitors for one or more generations has swerved from the characteristics of the ancestors, heredity and atavism will come into conflict, and the outcome cannot be predicted surely.

Some hints on probabilities may be had from an experiment conducted by my father on two varieties of the *Lupinus hirsutus*, the one with blue and the other with pink flowers. The conditions were in this case very well adapted to the study of the action of heredity, the flowers being in the Lupine not only hermaphrodite, but also cleistogamous, so that a seed is the produce of only one bloom of one plant. Two lots of seed were sown to begin with, some of the blue and some of the pink strain. Most plants turned out true, still a few with pink flowers were found in the lot of blue, and conversely, some blue among the pink ones.

In the following year seeds of the true plants were sown again, and along with them seeds of the "rogues" found in each lot. In the latter, the greater proportion of plants followed the colour of the parent plant, but a great many more showed the alternative colour than was the case in the original lots. Seed from blue and pink-flowered plants of the third generations were sown again, every possible combination in the relations of the ancestors as to colour and distance being tried as much as possible, and the number of blue and pink-flowered plants being

carefully noted in each case, and the experiment was carried on for several years. Though no exact rules can be arrived at from experiments with living things from the tabulated results of the experiment, the following inferences can be drawn:—

1. The tendency to resemble its parents is generally the strongest in any plant.

2. But it is notably impaired if coming into conflict with the tendency to resemble the bulk of the ancestors.

3. This latter tendency (called atavism) is constant, though not very strong, and scarcely becomes impaired by a series of generations passing by without a reversion to the ancestral type having taken place.

4. On the contrary, the tendency to resemble a near progenitor (two or three generations only distant) very soon becomes obliterated if the said progenitor be different from the bulk of the ancestors. From this it will be seen that choice new races can be raised quickest, and with the smallest amount of labour, where all needless conflict in the hereditary powers is avoided.

HOW THE ACTION OF HEREDITY CAN BEST BE TURNED TO ACCOUNT.

But it may be rightly remarked here, that it must be shown how variations can be obtained, before we are shown how they can be made permanent.

It is admitted by all observers that plants, being immovably fixed in the ground by their roots, and consequently prevented from seeking favourable and from avoiding untoward circumstances, are endowed by way of compensation with the power to adapt themselves to some extent to different conditions as to soil and climate. The manner in which plants so adapt themselves is most admirable, but it is not here the place nor the time to consider it. Suffice it to say, that the changes in the size, position, and anatomy of their various organs, appear to be much called up by than produced directly by the changed conditions. The important point in the present case is that variations in the special characteristics of a cultivated race may and do occur occasionally, and that such variations can be made permanent, and still magnified by the process of selection. To wait for them to appear among seedlings is the simplest and most ordinary process. But their appearance can be hastened and made more probable by the selection of seeds from a plant showing already some trace of variation, or by means of a cross with some other variety of the same species. As soon as a distinct variation has made its appearance the work of selection begins. The essential thing is to secure a deviation from the old type of the plant under experiment. It matters little whether such deviation takes place in the desired direction or not. Some authors even advise the experimenter to look for any change at the first stage, and at the next one for the greatest possible deviation from the first change in any direction, except a reversion to the old type. This may be useful so far as the appearance of new forms is concerned, but if adhered to too long, it might make the fixation of the new forms rather difficult and slow, by breeding continuity out of the new race.

FIXING DESIRED FORMS.

Whatever the cause of the original variation was, action of the plant's own tendency to vary, or some external cause, or a cross of pollen, the next thing to be done is to make the variation permanent by selection. This is sometimes very easy, the new form becoming at once perfectly true and fixed. A case in point occurred several years ago in my trial grounds at Verrières. One plant of *Clarkia elegans*, with pure white double flowers, was discovered among a number of the same species with double purple flowers. It was singled out of the seed sown the next year, when every plant raised gave only double white blooms, and it has never since been known to give any but pure white flowers. If such cases were of common occurrence, they would make the task of the breeder of new varieties a very easy one. Unfortunately, they are very rare exceptions, and the tendency of new seedling forms is rather to revert frequently and rapidly to the original type. Great attention and vigilance must be exerted to counterbalance this tendency to reversion. The best and most useful plan is not to mix together the seeds of the selected plants in case several were singled out, but to sow the seed of each separately, as the several plants selected may be endowed in a very unequal degree with the power of transmitting their own characteristics to their progeny. Now the principal object and the principal effect of selection, if well conducted, is to effect a complete transmission

of the qualities we seek of any given race. Its aim must be, in consequence, to eliminate any plant which is not fit to reproduce itself "true."

It is often observed that in such cases when the seeds of several plants selected in the same batch of seedlings are sown side by side, and separately, the one will come up true with only a very few or no "rogues" at all, while others will give a very medley of plants. If further selection be made only from the lot that came up true, the new variety may be considered as already fixed; whereas many years of cultivation and "roguing" may be required to bring it to anything like purity if progenitors be taken from the lots in which numerous variations occurred. Fixity of character is of great importance to garden and field plants grown from seed, and the tendency to fixity should be inbred in plants just as the tendency to earliness or to hardness. The power of transmitting their own qualities to their progeny is just as hereditary as any other qualification, and no effort should be spared to make it one of the points of a new race. Breeding from single progenitors appears so far to be the safest and shortest way to the proposed end.

CROSS BREEDING.

Cross-breeding greatly increases the chance of wide variation, but it makes the task of fixation more difficult. It, however, gives the raiser the only means in his possession to unite in one the qualities of two different plants while discarding their weak points. All the different qualities of the two parents seem to unite in the most varied combinations in the cross-bred products. In this way plants are often found which inherit most of the good points of both parents, while some others sum up the defects of both. This I repeatedly observed in rearing cross-bred Wheat. An occurrence not unfrequently observed in cross-bred plants is, that some character belonging to one of the parents is magnified in the progeny. For an instance, Mr. Charles Naudin observed in crossing *Daturas*, that the cross of a slightly prickly variety with another kind which had smooth stems, resulted in the raising of a decidedly prickly hybrid.

In framing the character of the progeny, the action of each parent is often very unequal, according to the power of each in transmitting its characters. The one that is better endowed in that respect stamps its features more firmly on the cross-bred plant. Discussions have arisen on the influence of the male and of the female progenitor on a cross. I believe that the stronger organism of the two, the one rather which is better endowed with the power to transmit its characters, will predominate in the progeny, whether it comes from the male or the female parent.

One trait that makes the fixation of cross-bred plants difficult, is in some characters of both parents breaking out in different parts of one and the same plant, instead of being, as we could wish, blended together. In cross-bred Peas, for instance, which were raised from a white-seeded and a green-seeded parent, it often occurs that at the second or third generation pods are produced, which contain mixed white and green seeds. In the same manner round and wrinkled seeds are found in the same pod. This is a great difficulty, and an almost sure sign of further variation, as a plant showing such breaks cannot be depended upon to give rise to a uniform progeny. In many similar instances recorded in my books of experiments, the green Peas gave plants with white seeds, and the white ones with green. You can scarcely expect a plant which is not constant in its own parts to be constant in its progeny.

The unity in character of any single plant is the main factor in the work of pedigree or grade breeding, and I wish to lay especial stress on that point, which I think of paramount importance. The consideration of the qualities or defects of a plant taken as a whole, not of minor parts, should guide the raiser in his work.

The advice is often given in horticultural books to take the seeds from some particular portion of the seed-bearing plant, in order to secure a better result. In German Stocks, for instance, it is a common belief that the seeds of pods taken from the middle or from the base of the main stem will give a larger proportion of plants with double flowers, than if taken from the top of the same or from side-shoots. I many times tested the idea, and it always proved a fallacy. All the pods on a plant give an almost exactly equal proportion of plants with double and single flowers, no matter what part of the plant they may be gathered from.

A real difference is in the percentage of single and double flowers from various plants of the same

* Read before the Seeds-men's session of the World's Fair Horticultural Congress, Chicago.

variety. In this way very wide differences sometimes occur, but not in the case of seeds taken from various parts of the same plant. I tried an experiment with seeds of *Chrysanthemum carinatum* gathered on double, single, and semi-double heads, all growing on one plant, and found no difference whatever in the proportion of single and double flowered plants. In striped *Verbenas* an unequal distribution of the colour is often noticed; some heads are pure white, some of a self-colour, and most are marked with coloured stripes on white ground. I had seeds taken severally from all and tested alongside one another. The result was the same. All the seeds from one plant, whatever the colour of the flower that bore them, gave the same proportion of plain and variegated flowers. No more proof, I think, need be given that selection, which is all-important in the case of seeds from different plants, is of no importance as regards the different parts of any one plant on which seeds may be borne.

No limit can be fixed as to the improvements which may be expected from care, thought, and selection. The gains of the last dozen years may surely be taken as the forerunners of better things. It is clear that no very important additions to our cultivated plants are to be expected now from the discovery of new species, but an unlimited field opens before the raiser of new and improved forms in all our garden flowers, and in fruits and vegetables. The recent success of European raisers of new *Begonias*, of hybrid *Gladioli*, and of large-flowered *Cannas* are equalled by the gains of the American raisers of *Chrysanthemums*, of garden *Betts*, and of *Tomatos*. I may add by way of conclusion, that much good may be expected from the more and more frequent exchange of strains between the old and the new world. Such complete changes of soil and of climate frequently gave rise to variation, and so either by subtle changes one cannot see the cause of or by well-considered crosses, American and European varieties of our useful or beautiful plants may give rise in their turn to more numerous and useful variations than would have occurred had these races been confined exclusively to the country of their origin. *H. L. de V.*

ASTERS AT CHISWICK.

The collection of *Asters* in the gardens of the Royal Horticultural Society at Chiswick is representative, and should be gone carefully through by all who are in a position to do so. Many very beautiful varieties never seen in gardens are flowering, but this year they are not so satisfactory as last, the extreme drought bringing them prematurely into bloom.

Last year the plants were in the trial-ground, but they have been shifted to the long border running the length of the conservatory. Varieties that usually flower a fortnight or so later are already past perfection, remaining in full beauty a very brief time. It is unnecessary to give a long list of names, and those really interested in the perennial *Asters* should get the *Journal of the Royal Horticultural Society*, vol. xv., parts 2 and 3, where Mr. D. Dewar of the Glasgow Botanic Gardens, in an able review and classification of the genus has given a lengthy list of the finest varieties, with description of each, as a guide to the best selection. He there mentions that "The collection of these beautiful autumn flowers now at Chiswick is by far the finest I have seen brought together in any one garden. They have been gathered from all the known sources in Great Britain; and, as far as possible, to facilitate the naming, the English forms have been planted side by side with a series of presumably wild or authenticated types. These latter are from Kew, and from the Harvard Botanic Gardens in America, long the head-quarters of the veteran botanist, Dr. Asa Gray."

The two showiest kinds in bloom at present are the earlier-flowered *A. acris* and *A. Amellus*. *A. acris*, a European species, is remarkable for its very dwarf, bushy habit of growth. The majority of species vary in individuals, and this is no exception to the rule, the poorer varieties being far inferior to the type, which is very free-blooming, the flowers pale purple. One named variety is distinct, but not a good garden-plant; this is *A. nanus*, in allusion to its very dwarf stature. *A. Amellus*, another European species, is one of the most showy Sep-

tember flowers. This presents very different characters to *A. acris*, the flowers deep purple-lilac, large, and produced in great profusion on the spreading shoots. There are several varieties, but it appears to me a matter of mere nomenclature, as all are very much alike. In the list referred to in the *Society's Journal*, *A. laevis* occupies a large space, and many of its varieties are beautiful. All those described and marked with *** are worth growing, and as the heights are given of each kind, it is easy to make a good selection. There is great charm in the more graceful forms, the shoots slender, and spreading about, quite different to the bushy and compact varieties. The flowers, though not differing greatly in colour, are of diverse shapes, but all the kinds bloom freely. It is interesting to see that the later-blooming *A. novae-angliae* has few forms; but nearly thirty varieties of *A. novi-belgii* are described, the plants varying in height from 2½ to 6 feet. The nomenclature of the *Aster* is much confused in ordinary gardens, and, as a rule, a very poor class of varieties is grown, very different to the beautiful things at Chiswick, which should be in all nurserymen's lists. They are getting better known than was previously the case, but there are many more kinds that should be planted in quantity. When not bunched together in borders, the *Aster* is one of the most lovely of garden flowers, and is in perfection at a season when shooting parties assemble at country-houses. It is then that the gardener is often puzzled to make a show of colour; but this may be easily accomplished by planting such showy kinds as *A. acris*, *A. Amellus*, and a good selection of the many varieties in the Chiswick gardens. As the list referred to in the *Journal* is so complete, and the outcome of careful selection and trial, it should be consulted without fear of getting poor-coloured or useless forms. *V.*

TOURING IN KUMAON.

(Continued from p. 265.)

KUCOTE.—Starting leisurely the next morning, we came to the village of Naia Thull, where is a good deal of cultivation, but very little going on at this particular time of the year. Pursuing our way, we soon came to the Naia Thull Bridge, rather a large and nice suspension bridge. Just opposite is a handsome Hindoo Temple, built by one of the old *Rajaa* of Kumaon; it looks a very striking object in this outlandish place. Now from this point we again struck due north. Much as we left the *Sargu*, we also leave the *Rangunga*, and not without some regret, as this is really the turning-point, from which every mile will take us nearer the starting-point. From the bridge the road leads for some 12 miles through an enormous Pine-forest, that must contain millions of trees. In due course we get clear of the Pine-forest, and encounter some heavy Indian Oak, which is a pretty good sign that we are getting up to something like 5000 or 6000 feet elevation. Soon some Tea is sighted, and we know we must be very near the *Berenag Tea Company's* estates.

Indian Tea.—In the course of an hour I found out the assistant-manager, and was not sorry to have an hour's talk with some one who could speak English. After a rest and some refreshment, I went down to the Tea factory and saw some 80,000 lb. of green Tea being got ready for export to Afghanistan in one consignment. Quite a small army of men are here sifting, fanning, sorting, sizing, and so on.

The next morning I went on a visit to Mr. J. G. Bellairs' place at Chowkooree, some 7 miles distant from *Berenag*. I found the enterprising proprietor willing to show me the ins and outs of this remarkable place; it is a large estate of nearly 2000 acres, very pleasantly situated, with very gentle gradients for Kumaon; indeed, acres of the estate are all but level. The elevation is about 6000 feet, and open on all sides to the sun. Some of the best Tea plantations in Kumaon are to be found here. In addition, I found an English bull, many pedigree fowls, Berkshire pigs, and plenty of cattle. Now, when it is remembered that all these things came from England, and that the place is 100 miles from any rail-

way station, and when the enormous difficulties of transit in Kumaon are taken into consideration, as well as the fact that there are only coolies to help you in any way, it reflects the greatest credit on the owner of Chowkooree. The place is magnificently timbered, and full of very fine *Mistletoe*. Some of the English farmers could take valuable lessons from the Kumaon planters; many of their difficulties are nothing to what the planters put up with cheerfully. A very magnificent view of the snow mountains is obtainable at Chowkooree, and after all a reasonably distant view is the best. Several very pleasant days were spent here, but as my time was drawing to a close, I left for Almora (via the *Daulchine Road*), some 50 miles distant. Some 20 miles from *Berenag*, I camped on the road-side near a village where were some very fine trees of the *Bassia butyracea*; at this time they were a mass of bloom, and thousands of bees were busy, and also numerous birds and insects—in fact, these noble trees seem to afford endless food for all the insects in the neighbourhood.

The next day I reached *Daulchine*, 7 miles of the road leading through another fine Pine-forest, and thence early next morning to Almora, and the following day to Ramghur, and thus my month's leave was at an end.

Perhaps the matter for greatest regret is the very few plants that were in bloom in November. The best season for travelling in Kumaon, from a gardening or botanical point of view, is no doubt during the monsoon season, then innumerable *Begonias*, *Caladiums*, *Achimenes*, *Acacias*, and a profusion of Ferns, *Selaginellas*, and numerous other plants, are in the greatest luxuriance; but then the monsoon season is not a joke in India, particularly in Kumaon. You might start on a tour in fairly good weather, but it is much more probable that, just after you have started, it begins to rain, and continues to do so in torrents for three to five days. This happened three years ago, during which time no fewer than 26 inches of water were registered; and I have known the thermometer to fall suddenly from 80° to 50° within two hours. For this and sundry other reasons, touring in the monsoons is decidedly risky.

In conclusion, I think some of your well-to-do readers should come and see Kumaon in the months of October and November. It is then, as a rule, matchless for climate, and the people are very simple, and absolutely safe. It would have been an easy matter for my men or some villagers to have killed me, or to have robbed me, times out of number, but no such thought ever entered their heads, and Kumaon may be said in every way a delightful place for touring in the months specified. *F. W. Sears, Ramghur, June 25, 1893.*

NURSERY NOTES.

MESSRS. W. BALCHIN & SONS, HASSOCKS, SUSSEX.

Known far and wide as the best cultivators of that lovely blue greenhouse plant *Leschenaultia biloba*, which is so much admired every year at our summer exhibitions, this firm are working up a stock of some of the pretty and compact *Boronias* and other greenhouse plants, which aforesaid have been prime favourites, and which now again seem coming into well-deserved favour, for not only are they neat in habit and profuse flowerers, but last in bloom for a considerable period of time. Of *Leschenaultia biloba* we found a stock of over 1000 plants all in perfect health, and it was easy to imagine what a rich display will be afforded when the plants flower. Of the pretty *Boronia serrulata* a stock of about 500 plants was noted; while of *B. megastigma*, that delightfully Violet-scented species, and other *Boronias*, *Tremandra verticillata*, and various favourite New Holland plants, there are proportionate numbers. Here too in the greenhouses, *Acacia cordata*, by a little management is made to form compact plants, and *A. armata* and other species of *Acacia* are well done. But the chief efforts of the establishment are directed to plants which furnish cut flowers, and are desirable for decoration in the several branch shops

in Brighton, which are among the best of their kind in the country. Hence in making the tour of the nurseries one observes showy, useful subjects grown in large numbers, and these predominate, and bespeak the skill of Mr. Richardson, the foreman, his success with Tuberoses, for instance, being quite remarkable. The Pearl Tuberosa is the variety favoured, and those of it now in flower do not appear to have failed in any case to form flower-spikes, which it may be said are self-supporting; being as thick at the base as one's finger, and bear from twenty to thirty very large fine flowers. The foreman told us that he has had plants with as many as forty on one spike, but those that we noticed were certainly the best we have seen. A houseful of Roses, *Maréchal Niel* and *Niphetos*, growing in pots, come next, then follow houses of *Erica hyemalis*, *Cyclamen persicum*, one of *Pelargoniums*, among which *Raspail* and *M. Bruant* are favourites; houses of Ferns, and Orchids which are found useful for cutting, and which are well grown, although nothing like a collection of Orchids is attempted. The *Dendrobium nobile* are good, the batch of *Cypripedium insigne* said to be one of the most useful for cutting; the *Laelia anceps* sending up spikes freely; *Cattleya Leopoldii* and other *Cattleyas* in flower, and so also *Sobralia macrantha* and a few others. Another house contained flowering plants of *Bouvardias*, *Heliotropes*, a fine lot of *Poinsettias*, and some plants of a superb strain of *Celosia pyramidalis*, each plant being compact, perfectly pyramidal, as broad as high, and of a bright dark crimson. Next we came to a small house with a large case of well-grown Filmy Ferns—a grand *Todea superba* occupying the centre; on the roof was a plant of *Lapageria alba*, well bloomed; and then came houses of Palms and other foliage plants, very suitable for the work for which they are required, the *Kentias* evidently being the favourites.

Among other good batches of plants we found a pitful of the old *Echeveria retusa*, which is said to be very durable for indoor decoration; a fine berried lot of plants of *Solanum capsicastrum*; many of *Begonias*; a considerable quantity of *Lilium Harrisii*, and, still outside, a large number of well-grown *Chrysanthemum Avalanche*, and other varieties.

In the outside quarters, quantities of compact-growing shrubs, *Pyrethrum roseum*, perennial *Helianthus*, *Anemone japonica*, and hardy flowers of a similar character for furnishing cut flowers were observed, while each side of the main walk is planted with a fine selection of flowering and other shrubs, besides Conifers; the large standards of the variegated *Acer negundo* and Portugal Laurels form a fine feature.

LOWTHER CASTLE.

A FEW miles from Ullswater, and commanding magnificent views of the Cumberland Mountains across the valley of the Lowther, is the stately pile of Lowther Castle. It is nearly 800 feet above sea-level, and exposed to very severe storms, which tax the hardiness of the trees and plants of the fine woods and gardens. The soil is loam and clay, resting upon limestone; where the shelter from south-west winds is efficient, we find that Conifers flourish well. The celebrated Dragon Walk is a dark avenue of ancient English Yews, whose fluted stems and fantastically interlaced branches give quite a weird aspect to the quiet walk leading to the Rose-garden, which the gardener, Mr. Clarke, has been arranging. This Rose garden is an oblong space surrounded on all sides by lofty deciduous and coniferous trees, with a large rustic summer-house on one side. At each corner is a "bell-tent" of Roses climbing up chains, and each tent contains a seat; and a "marquee" of climbing Roses is *vis-à-vis* with the summer-house. The fine beds of dwarf Roses are tastefully relieved by masses of herbaceous plants, festoons of climbing Roses; *Clematis* and *Ampelopsis* surround the whole.

The Conifers which succeed well on the limestone and in this cold situation are *Pseudotsuga Douglasii*, of which some fine examples are to be found; *Abies*

Pinsapo, *A. Engelmanni* [probably *pungens*] *glauca*, *A. cephalonica*, *A. lasiocarpa* [probably *A. Lowiana*], and many *Cupressus*. Sometimes, however, the snow is troublesome in breaking the branches. Scotch Firs make excellent growth. There is a good avenue of Beech trees. The soil is unsuitable for *Rhododendrons*, *Heaths*, and other *Ericaceae*, so that it is necessary to bring peat from Shapfells. In this way a pretty alpine garden has been formed, through which a stream runs, fed by the fountains which play in the Rose garden.

The castle is surrounded on all sides by brilliant flower-beds; grand clumps of *Humea elegans* associated with crimson and scarlet *Begonias*; the bright yellow *Calceolaria amplexicaulis*, with dark *Perilla*; beds of large standard Ayrshire Roses, and clumps of *Clematis*, together with strong herbaceous plants, make a grand show.

A winter garden has recently been erected on the south side; the walls are covered with Ferns, *Selaginellas*, and *Begonias*; large hanging baskets are suspended from the roof, and groups of Palms arranged on the floor, which is paved with parquet flooring, the heating-pipes being concealed by grids over which the seats and lounges are placed.

We are not going into a detailed description of the greenhouses, Peach-house, and vineries. The greater part of the fruit and flowers is sent away to London, or wherever Lord Lonsdale may be living. Specially-made boxes, about 6 inches deep, with twelve pigeon-holes, are used for Peaches; each Peach is wrapped in tissue-paper, with sufficient paper left to screw up to carry it, and it is then placed in cotton-wool in one of the compartments of the box. Each box thus carries one dozen Peaches; the lids are hinged on, and secured by cords. Similar care is used in packing cut flowers. Carnations are here a favourite flower for cutting, and Mr. Clarke has a new one called *Countess of Lonsdale*; it will be shortly sent into the market. It is a full flower, with smooth shell-shaped petals of bright scarlet-crimson, slightly scented, and very hardy. Several houses are devoted to *Gardenias*, the favourites being *G. Fortunei*; every day throughout the year a button-hole flower of *Gardenia* is despatched to Lord Lonsdale.

The gardens are surrounded by a splendid park, where roe and fallow deer, also Galloway cattle, feed. Many alterations are now in progress, and we hope to make further notes in the near future. F. V. D.

THE WOOD OF THE AMERICAN TURPENTINE TREE.

THE value of the American long-leaved Pine (*Pinus australis*) depends chiefly on its turpentine and timber, but the value of the latter, as set forth in a report to the Foreign Office, by the Consul at Pensacola, would seem to be so far in excess of any other timber, that it is worth recording. In textile strength it is stated to approach and perhaps surpass cast iron. In cross-breaking strength it rivals the Oak, requiring it is believed 10,000 lb. pressure per square inch to break it. In stiffness it is superior to Oak wood by 50 to 100 per cent. It is best adapted and much used for the construction of heavy work in ship-building; the inside and outside planking of vessels, taking the deals and planks of the best quality. For house-building it is used almost entirely in these parts, and in buildings for railroads, railroad cross-ties, viaducts, and trestles, this wood is foremost. The finer grades and the curly wood are very much used for the nicer and unpainted wood in the best dwellings. The hardness of this wood especially fits it for planks and flooring. The finer grades of curly Pine are used for the manufacture of furniture, and it is said that for bedsteads it is admirably adapted, as the resinous wood is a preventive to inroads of insects and such pests. The resinous products of Pine wood supply many parts of the world with pitch, resin, and turpentine, and contrary to opinions formerly held in this respect, it is said that the tapping of the Pine tree for turpentine strengthens instead of weakens the wood.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

HINTS ON WORK IN GENERAL.—The abnormally small rainfall during August experienced in south-east England has rendered the ground so dry that vegetable growth is at a stand-still; green vegetables are very scarce. Late sowings of dwarf Beans have, however, held their own, and are yielding excellent pods. In no recent years have the effects following high cultivation been so apparent as the present, and where this has prevailed, the crops generally are excellent, especially if the water-supply is a good one, which in our part is not the case in the majority of gardens. Small seedlings severely suffered, and unless rain should fall in considerable quantity shortly, Cabbages will be very late.

SALADS.—There has been difficulty in obtaining crisp Lettuces, but I have found that Sutton's Mammoth withstood the drought better than any other, and kept crisp and good long after others had bolted. Lettuces like a cool rich soil in summer, and if there are means of flooding the ground occasionally, little fear of a scarcity need be felt. It is not yet too late to make sowings of Lettuces for use in the spring, but in northern counties a cold frame should be utilised; plants in the seed-bed large enough to handle should be transplanted, and such will better withstand frost than such as are drawn up tenderly. Radishes should now be sown on a warm border; sow thinly, or too much top-growth will be made. Endive should be blanched as required for use, and it will be found a good substitute for Lettuce, where the latter is not plentiful; only a few heads should be blanched at a time, as Endive soon decays after blanching is complete. Mustard and Cress may still be sown in the open, but handlights or a frame should be put over the seeds. Corn salad sown last month will now be large enough for thinning, and another sowing may be made. American Cress may be sown for spring consumption.

TOMATOS.—See that all fruit is gathered as it approaches maturity, and keep all growths pinched off.

CELERY.—Where earthing may have been postponed on account of the dryness of the soil, the ridges should be heavily watered, after being loosened with a fork, and before the soil gets dry some of it should be put to the plants. Do not earth above the heart leaves, or a check to growth will be given, besides deforming the inner stalks. Make sowings in pans of Celery to be used for flavouring, and if the seeds do not germinate freely, place on a slight hot-bed, and allow good ventilation after germination.

CARDOONS.—Continue to blanch these plants, and be sure that the roots are thoroughly moistened before doing so; at the same time take care to prevent water getting to the hearts, or decay soon follows.

CAULIFLOWERS.—Where no sowing has been made, choose a warm situation, or a cold frame, and sow Sutton's Mammoth, or Autumn Giant, which will follow the early kinds that are sown in the spring, and afford fine heads during June and July. Those planted in the open ground will be benefited by a dressing of nitrate of soda applied in showery weather.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

THE MEXICAN ORCHIDS.—*Laelia anceps*, *L. autumnalis*, *L. alba* should now be showing their flower-spikes, and require to be afforded water freely till such time as the new growths are finished; the air of the house should be also kept in a moist state, and it is good practice to syringe freely amongst the pots in which they are growing. An abundant bloom may be expected from these *Laelias* this year and next, the warm summer having benefited the plants greatly. Now that the spikes have got away from the leaves, is a suitable time to sponge the plants even should no insects be present; the summer dust will require to be cleaned off the leaves—make use of soft-soap and soft water for this job. Cockroaches sometimes devour the young flower-spikes of *Laelias*, and should be well sought for. *Odontoglossum citrosium* we cultivate in the Mexican-house, and the plants being in full growth, will take copious supplies of water if they are in a healthy condition.

CATLEYA LABIATA VERA.—The tropical summer has suited the above species, as is evident in the longer and stouter pseudobulbs; even the well-known autumn-flowering *C. labiata* has made pseudobulbs equal to those on recently-imported plants. As all Orchid-growers know, newly-imported Cattleyas do well for perhaps half-a-dozen years, but after that time, they try the skill of the best cultivators to keep them in vigour, especially if they have flowered freely. Our Cattleyas get weaker after that time has elapsed, more especially specimens, say, from 2 to 3 feet across, growing in pots of from 18 inches to 2 feet in diameter. It may be that in these large pots or pans the roots of the new growths in the centre of the plant fail to reach the sides of the pot, but penetrate the mass of peat and moss, with the consequence that they die off, and weaken the growths in the middle of the plant; and this goes on every year, with injurious effects. A Cattleya may be grown well for years in pots of from 6 inches to 1 foot in diameter, without fear of their getting out of condition. This may be one reason why one finds the autumn-flowering *C. labiata* in such good condition to-day, after perhaps 20 years of cultivation. *C. labiata vera*, after growth is complete, should be hardened off by having all possible sunlight it is safe to afford, but being sure that there are no flaws in the glass to cause burning. Carefully water the plants, or they may start to grow anew, which would spoil their flowering considerably. Afford less water at the roots and moisture in the air, with fresh air admitted day and night whilst the outside temperature admits of it.

THE HARDY FRUIT GARDEN.

By T. TURRON, Gardener, Maiden Erlegh, Reading.

LIFTING AND REPLANTING PEACH TREES.—Young vigorous trees of Peaches and Nectarines are brought into bearing, and can also be maintained in a fruitful condition, by adopting a method of annual or biennial lifting and replanting. [Not always necessary in suitable soils and certain localities. Ed.] This should usually commence two years after planting, and where trees have been properly planted at first, received due attention with regard to root-watering, and the leaves kept free from red-spider and aphides, which appear early in the season, they generally make a free growth the second year. Lifting and replanting such trees early in the season afford a check to further growth, and assist the ripening of the wood. Should the soil of the border be dry, a good watering should be afforded, and the lifting postponed for two or three days, that is, till the soil has become workable again. A wheel-barrow load of old mortar and wood ashes in about equal parts, well mixed together, should be given to each tree-station to keep the soil open. In the case of older trees and exhausted soil, the whole of the old soil about the roots should be dug out, and the drainage made good; and before the old soil is returned, fresh loam, old mortar or chalk, and burnt refuse should be added to it. Replanting should always be quickly performed, the roots meanwhile being covered over with wet mats or litter. Long or injured roots should be cut back before replanting, and the trees syringed daily for a time if the weather prove dry. In any case afford a heavy watering to settle the soil about the roots, whether rain fall or not, and apply a mulching of spent hot-bed manure.

GATHERING FRUIT.—It is a too common practice to gather Apples and Pears indiscriminately in the belief that the whole of the crop is ripe because a few may have fallen on account of the dryness of the soil. Late Pears and Apples are better left on the trees, even if a part of the crop be lost by falling from the tree or be eaten by wasps, which will not trouble us much longer. Heavy root-waterings will aid in retaining late Apples and Pears on the trees, and do not rely on the rain to moisten the soil deeply. Unless some such means are taken to prevent late Pears from ripening prematurely, there will be a scarcity after the month of November is past. Doyenné du Comice, Winter Nelis, Glou Morceau, Josephine de Malines, Bergamotte d'Espereu, Easter Beurré, and Beurré Rance should remain on gathered for at least another month. The same applies to the following varieties of Apples:—Cox's Orange, Blenheim, and Cocker's Pippin, Adams' and Claygate Pearmain, Northern Greening, Norfolk Bearer, Annie Elizabeth, and Wellington, all of which will continue to grow for a few weeks longer if afforded heavy root-waterings. The gathering of all mid-season sorts of Apples and Pears demands daily attention, and more than usual care will be

necessary this season to examine every fruit before storing them away, if it be pecked by the birds or injured by wasps.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

RICHARDIA ÆTHIOPICA.—These plants should be taken indoors before there is any danger from frost, and those that were planted-out potted-up forthwith in loam of good quality and leaf-mould, ample drainage being afforded. The best results are usually obtained when the plants are kept in pots, provided they are well attended to.

BOUARDIAS which were planted in the open should also be taken up carefully and potted, using plenty of drainage in the pots. After affording the plants a thorough watering, place them in a cool-house, using no fireheat for a time. A slight amount of shade during the brighter part of the day, and a damping with a fine rose-pot or syringe, keeping rather close for a time, will greatly benefit the plants. Much care should be taken not to break the roots more than can be helped, and do not under-pot large plants. After the lapse of ten days, more air may be gradually afforded, and a temperature of about 50° by night, 55° to 65° by day, will suit them.

SCENTED PELARGONIUMS—All plants in pots should be taken indoors as soon as the nights become cold; for although they will bear a few degrees of frost without injury, a continuance of cold exposure changes the leaves to a yellow tint, and they are then useless for decoration. These species are useful for winter bouquet-work, but they most for this purpose be kept in a healthy state. I find that these plants and Richardias do well together in the same house, where a temperature of about 50° by night, and 55° to 60° by day, is maintained, and abundance of air given. Callas, if well grown in pots during the summer, often bloom well in the above temperature during the winter; the foliage keeps strong, and the plants are more suitable than weak-drawn ones for standing in rooms when showing flower; they are quickly pushed out by being placed in a warmer house. The Pelargoniums require air night and day for a time, or their foliage will drop off. A watering of clear soot-water or liquid-manure once a week will do them good. Fumigate the plants with tobacco, or some good preparation of it, or syringe with Quassia-water should green-fly be troublesome.

CHRYSANTHEMUMS.—The varieties Mrs. Rundle, Glenny, Dixon, and Donna Maria, now just coming into flower, should be placed in a cool-house and neatly trained, if grown for decorative or cutting purposes. They can be formed into nice pyramidal plants if one strong stake be put in the centre of the pot, and each shoot tied up with a piece of thin rolled raffia. Only one flower should be left at the end of each shoot. Madame Desgranges, now in flower, should be protected from heavy rains and wind.

THE FLOWER GARDEN.

By T. H. CRASP.

PREPARATIONS FOR THE SPRING.—The present is a good time to settle the method of the planting of spring and early summer bedding plants, so that everything may be put in readiness to replant the beds on the removal of the summer occupants. Bare beds are not pleasant objects, hence the desire to make them somewhat attractive with low-growing shrubs, and such hardy plants as *Silene pendula*, *Arabis*, *Myosotis*, *Hepatica*, *Phlox verna*, *Anemone*, *Wallflower*, *Viola*, *Aubrietia*, as well as Dutch and other bulbs. These plants seem to have, after a few seasons, a kind of monotony that is not pleasing; but this may be remedied in great measure by the free use of hardy annuals, which survive an ordinary winter. The following is a list of the more trustworthy and useful of these:—*Nemophila insignis*, *N. i. alba*, *Limnanthes Douglasii*, *Collinsia verna*, *C. bicolor*, *C. caudidissima*, *Vicarias* in variety, *Bartonia aurea*, and various kinds of *Candytufts*. If the beds are vacant, or nearly so, the seed may be sown where the plants are to remain, and it is best so, sowing the seed thinly on a fine-raked surface, affording the bed a coating of fine soil. The seedlings in the beds must be guarded from slugs by occasional dressings of lime or soot in a dry state, and thinned out to 3 inches apart.

If the seeds cannot be sown where they are to remain, sow them in rows in a good open situation, 3 inches apart, using the same precautions as previously mentioned. When the seedlings are large enough to be handled, they should be lifted carefully, and pricked out 2 or 3 inches apart, being careful not to bury them below the seed leaves, whence they should be lifted, and carefully planted in their permanent quarters any time from October to March, choosing mild weather for the work. These annuals can also be used in window-boxes along with bulbs, &c., and if arranged nicely, they make an effective display at the end of the month of April and the following month. At the present season, *Aucuba*, *Holly*, *Rhododendrons*, and most Conifers, may be moved with safety, and if the time will permit, alterations in shrubberies and pleasure-grounds may be undertaken and carried out with greater facility than in the winter or spring.

WINDOW-BOXES.—The season has been a very trying one for plants in window-boxes and other exposed places, and it will be generally found advisable to discard most of the old plants, and re-fill the boxes with plants that will be effective till the frosty weather begins. The dwarf variety of *Asters* are well suited for this purpose, as they feel little check from removal if it be carefully done, and afterwards the boxes may be re-filled with dwarf early-flowering *Chrysanthemums*, choosing such varieties as *Madame Desgranges*, *G. Wermig*, *Amy Russell*, &c., thus adding an extra few weeks of brightness to our window arrangements.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Farnham, N.B.

VINES.—Permanent fruit-bearing Vines, whether young or old, should now have every shoot well-ripened to the very ends, nothing being of a green colour but the leaves, and these should be in good condition, strong on late Vines, and remain on the wood till the end of the year. Where ripening is not completed, every assistance should be afforded the Vines by heat and air to mature the wood which is to supply next year's crop. If mulching is still over the border, or the surface-soil close and impervious to the air, the whole of the upper crust should be removed, without injuring any of the roots. When roots are in good condition, there is little cause for anxiety by reason of unripened Vines. When forcing is resumed, the partially-reduced border can be raised to the desired level by adding fresh healthy soil. The ripening of Vines is often retarded by placing plants in the structures necessitating the use of water, and preventing a free current of air from passing through the house. Inside borders, if shallow, should be examined, to make sure that the roots are not suffering from dryness. Young Vines should not be encouraged to grow too late, but aided by use of fire-heat to ripen the rods. Supernumerary Vines should be closely stopped at the length of rods which are to remain for fruiting; any green tops should be removed, and sublaterals cut well back. No liquid manure should be afforded Vines after this date, and should mildew appear, syringe the Vines with sulphur and water in the proportion of two handfuls of the former to 3 gallons of water. If Grapes are ripe, remove them, and bottle the bunches before using the sulphur. Fruit affected with mildew can be fumigated with sulphur in a close room.

FIGS.—Those which are grown in pots for early forcing should now be resting, protecting them meanwhile from heavy rains, which will allow the foliage to ripen naturally. If the pots are plugged in coal-ashes in the full sunshine, the roots will be saved from becoming unduly dry, while the wood and foliage, now dropping off, are benefited by the autumn breezes. If any bushes have crowded heads, thinning of the shoots should be done, removing weakly shoots, and leaving only those which are firm and likely to be fruitful. Trees trained to walls or in other permanent positions should have the same kind of useless wood removed, and all the roots lifted or pruned, unless the trees are bearing late crops of ripening fruit. Dryness at the roots, not sufficient to cause suffering, will induce the due ripening of the fruit and maturation of growth. For early forcing, or indeed for any purpose, there are no varieties which surpass *Brown Turkey*, *St. John's*, and *White Marseilles*, *Grosse Verte*, and *Raby Castle* for certain and abundant cropping.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

LOCAL NEWS.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES.

MONDAY,	SEPT. 18	Dutch Bulbs, at Protheroe & Morris' Rooms.
		Plants from Belgium, at Protheroe & Morris' Rooms.
TUESDAY	SEPT. 19	Greenhouse Plants, Piping, &c., at the Chiswick Nursery, Turnham Green, by Protheroe & Morris.
		Great Importations of Dutch Bulbs, at Stevens' Rooms.
WEDNESDAY,	SEPT. 20	Orchids, at Protheroe & Morris' Rooms.
		Dutch Bulbs, at Protheroe & Morris' Rooms.
THURSDAY,	SEPT. 21	Greenhouse Plants, at the Moat Nursery, East Grinstead, by order of Mr. A. Clark, by Protheroe & Morris.
		Great Importations of Dutch Bulbs, at Stevens' Rooms.
FRIDAY,	SEPT. 22	Dutch Bulbs, at Protheroe & Morris' Rooms.
		Plants from Belgium, at Protheroe & Morris' Rooms.
SATURDAY,	SEPT. 23	Great Importations of Dutch Bulbs, at Stevens' Rooms.
		Orchids, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.—56'9.

Mixed Plantations. No one paying attention to the composition of woods and plantations throughout the country, can fail to be struck with the difference existing between those planted in the last fifty years, and older woods of the last or the beginning of the present century. In the latter we rarely find hardwoods and Conifers intermixed to any great extent, while recently-planted woods contain a mixture of a dozen or even more different species. Records of ordinary estate work are rather rare, and it is not easy to obtain accurate details of the system of planting adopted more than a hundred years back; but it may be reasonably assumed that the mixed plantation of the present day had a limited existence. The comparative scarcity of many of our now common Conifers may have had something to do with this, but one might almost suspect that our ancestors possessed a more correct taste and knowledge of harmony than ourselves. There is little doubt that most of our old woods

were formed under the direct supervision of the proprietor, who would naturally combine due appreciation of the beauties of indigenous trees with the depth of his own pocket. Introductions which we now look upon as common forest trees, would then be confined to the arboretum, their acquisition costly and their hardiness doubtful. The list of trees from which the old planter could select, would now be considered a limited one, and perhaps it was fortunately so. Those grand old clumps of Oaks, Beeches, Elms, &c., which throw such a glamour over the ancestral seats of this country, might not now be in existence had our predecessors been in a position to plant exotics in place of indigenous trees.

The comparative sylvicultural advantages of mixed and pure woods is a wide subject, and cannot be discussed here. But does the æsthetic side of the question demand no attention? Trees are long-lived, but not immortal; and when our present veterans of the park and wood succumb to storms and disease, we should be provided with successors.

As planting is, and probably always will be, popular with landed proprietors, we need have no fear that a lack of trees or woods will ever occur; but it is questionable whether the woods of the future will possess the beauties of the present ones. Each species has a certain well-defined character of its own, which cannot be imitated by any other, and this character is still retained when individuals are merged into a solid mass. For instance, the Scots Fir and the Beech present two different types of forest scenery when unmixed, but let the two be blended together and their respective characters are lost, although the mixture may still be agreeable to the unexact observer.

We are apt to overlook the fact that variety is not obtained by a formal and regular mixing of so many different species in mathematical order; for this simply amounts to the constant recurrence of an indefinite number of groups arranged on the same pattern, like the design for a carpet. In early life such a plantation may be preferable to an unmixed mass of foliage with little variation of shade or form, but later on its heterogeneous composition is not apt to excite admiration. A judiciously-planted clump of a species other than the prevailing one, showing alterations of the surface and character of the soil, affords far more variety than half-a-dozen species when uniformly mixed throughout a plantation.

Nature invariably forms her forests on such a group system, and woods cannot present too natural an appearance. By such a method a definite character is given them, and they become something more than an incongruous mass of stem and foliage possessing no individuality of character. The conformity of the surface, whether hilly, undulating, or flat, is usually accompanied by an indigenous forest vegetation, which is in close sympathy with its surroundings. It does not follow, however, that no species but those Nature has provided are to be tolerated; but it is probable that the planter who produces the best effects on the landscape is he who confines himself to native trees in forming the groundwork of his plantation, or at any rate, allows one species to predominate, using others with due regard to their surroundings.

The subject is rather more suitable for the landscape gardener than the ordinary forester; but looked at from any point of view, the general conclusions arrived at will be pretty much the same. A. C. F.

SPIRÆA ARUNCUS.—Spiræa Aruncus is at once one of the most stately and one of the most elegant of herbaceous perennials. Its habit confers stateliness, its foliage and inflorescence endow it with elegance. It is a very old inhabitant of our gardens, but it is not often we see so fine a specimen as that which we are now privileged to illustrate through the kindness of Mr. WILLIAM MARSHALL, the genial and business-like Chairman of the Floral Committee and of the Committee of the Gardeners' Orphan Fund. The plant in question threw up no fewer than fifty-six of its feathery panicles of whitish or cream-coloured flowers. See Supplementary Illustration in this issue.

BOTANICAL MAGAZINE.—The plants figured in the September number are:—

Bauhinia variegata var. *candida*, t. 7312.—A very striking species, with its curiously-bilobed leaves and erect panicles of large white flowers. Kew.

Armeria latifolia, t. 7313.—A Portuguese species of tufted habit, with linear oblanceolate leaves, and stalked head of pink flowers.

Megaclinium minutum, t. 7314.—A curious little Orchid from Sierra Leone, with oblong pseudobulbs, each with a pair of oblong leaves. The flattened rachis springs from the base of the pseudobulb, and bears two rows of small orange-brown flowers. Kew.

Saxifraga media, t. 7315.—A dwarf species, with dense rosettes of obovate spatulate glaucous leaves, from the centre of which the flower-stem rises, with scattered linear leaves and racemes of small gland-covered red flowers. Pyrenees.

Schizocodon soldanelloides.—The curious and pretty Japanese plant figured in our volume for this year, p. 415, fig. 59.

"KEW BULLETIN."—An announcement in the last number states that papers on particular subjects will be brought together to form separate volumes. In this way a volume on "Vegetable Fibres" is now in course of preparation. This is good hearing, as the *Kew Bulletin* is rendering excellent service to economic botany, whilst the miscellaneous notes showing what is going on at Kew are very interesting.

THREE NEW SONERILAS.—Just now the Sonerilas are looking particularly bright, their gay foliage making them most useful plants for the warm or temperate-house. M. MARCHAND, one of the managers of the Ghent firm of VAN HOUTTE, known for his successful hybridisations of *Bertolonia* and of *Sonerila*, has succeeded in raising these plants with wonderfully broad leaves. In *S. Madame Léon Say* the blade measures about 6½ inches long by 4¼ inches broad. The plant is dwarf, scarcely 5 inches high, and with fourteen well-developed leaves, which make the entire plant about 16½ inches in diameter. This acquisition is from *Souvenir de Madame Van Houtte × orientalis punctata*; it has the characteristic of the mother, and the vigour of the father. The handsome foliage bends gracefully back, and is speckled with innumerable silvery dots, the largest in the centre of the blade, and others, gradually diminishing in size, towards the edges, along which are the smallest of all in close rows. These dots have more space between them than have those of *S. Souvenir de Madame Van Houtte*, consequently the leaf is prettier than that of the latter. *S. Madame Blommaert* is as sturdy as the above-described species; the foliage is rather less wide, but the ground-colour is very dark bronze-green, verging upon black; the little round speckles are further apart, and all quite distinct; the branches and petioles are also of a much deeper red—the whole plant, in fact, is dull, showing traces of *S. orientalis*, and a scheme of colouring much deeper than that of the variety *punctata*. *S. Prof. C. de Boeschère* is different from other *Sonerilas*, and will be much valued. The well-marked veins are surrounded by a clear metallic green stripe, numerous little dots of the same shade on a dark green ground are grouped in horizontal bands, so that the foliage is streaked. The base of the veins and the toothed edges are claret-coloured; the under-side of the leaves is also pretty; the veins are claret-coloured, the stripes and

SPIRÆA ARUNCUS IN THE GARDEN OF W. MARSHALL, ESQ.

tips clear green, while the rest is deep red. The plant is dwarf, and from the same parents as is S. Madame Léon Say. *Ch. De Bosschère.*

GHEENT HORTICULTURAL SOCIETY.—On the occasion of the monthly meeting on Saturday, September 9, Certificates of Merit were awarded to M. G. Gyselynck for a Rhododendron seedling with leaves variegated with yellow; also to *Dracana indivisa foliis-argenteo-variegatis*, from the same exhibitor; to l'Etablissement Horticole, Ste. Dorothee, for *Æchmea Weilbachi foliis variegatis*; to M. Ed. van Coppenolle, for *Dracana van Coppenolleana*, a seedling of *D. australis*, raised in 1892; to MM. Duriez Frères, for *Adiantum cuneatum foliis variegatis*; to M. H. Schmitz, for *Encholirion speciosum*, from Brazil; to M. Jules Hye, for *Miltonia Moreliana superba*; for *Cypripedium triumphans* (*Enanthum superbum* × *Salleri Hyeannum*); for *C. giganteum* (*Harrieianum* × *Salleri Hyeannum*); to M. Henno Delbosse of Tournai, for a collection of *Gladiolus*; to M. Louis van Houtte, of the Socié Anonyme Horticole, for *Sonerila Madame Léon Say*, for S. Madame Blommaert and for S. Professor Charles De Bosschère.

THE ARAUCARIA AT KEW.—From the *Kew Bulletin* we learn that sections of the trunk of this famous tree have been placed in the Museum. The trunk measures about 30 feet in height, and is 1 foot 4 inches in diameter at the base. Nothing is said about the transverse section, but a careful study of the rate of growth in different years would have exceptional value from the known history of the tree from infancy, till its premature decay a year or two ago.

UNITED STATES NATIONAL HERBARIUM.—A systematic and an alphabetical index to all the North American new species of flowering plants and Ferns described in 1892 has been prepared by Miss JOSEPHINE CLARK, and published under the authority of the Secretary for Agriculture. We note that the names of plants derived from personal appellations are invariably spelt with a small initial letter, thus, *Sida garckeana*, *S. palmeri*. We shall have students and novices referring to their dictionaries to ascertain the meaning of *garckeana*. How is a young American botanist to know that Dr. GARCKE is the person in whose honour the plant was named?

"BRITISH FUNGI."—The Trustees of the British Museum have published a guide to SOWENY's models of British Fungi. Mr. W. G. SMITH was entrusted with the task of restoring the models of Fungi made by JAMES SOWENY. "By his deft manipulation the models have once more become faithful representations of the living plants. An excellent little handbook, with neat and accurate illustrations has been prepared, so that the student of these plants have now every facility put in their way, and the evanescence of the plants themselves is compensated for by the models and by the descriptions and illustrations."

LATHYRUS SYLVESTRIS has, according to the *Proceedings of the Agri Horticultural Society of India* (April to June, 1893), proved a complete failure at Lucknow and Saharunpore. Things are not much better at Natal.

"DIE NATURLICHEN PFLANZEN FAMILIEN."—The eighty-seventh part just issued contains among other monographs, one on the *Batidacæ*, by Dr. DAMMER, and one on *Combretacæ* by Sir DIETRICH BRANDIS. Myrtles are treated of by Mr. NIEDENZU, and *Melastomads* by Mr. F. KRASSER.

STOCK-TAKING: AUGUST.—Notwithstanding the "coal war" and the usual amount of disquieting rumours, the trade of the United Kingdom shows nearly "as usual," a wonderful amount of elasticity, and were our colonial friends quite in touch with us as to tariff arrangements, they and we would to-day show a better monthly account, good though (for us) that now before us is with imports in excess of those for August last year. But for the sad state of things in the coal-fields, the exports would have shown a

large increase—but of these more anon. The trade returns for August show an increase of £157,720 as compared with the same period last year. Now this in the face of a falling off in the import of live stock makes for improvement in manufactures, and textile fabrics stand forth to answer. Our extracts from the monthly Summary of Imports are as follows:—

IMPORTS.	1892.	1893.	Difference.
	£.	£.	£.
Total value for month	£34,844,365	£35,002,085	+157,720
§II.—(A.) Articles of food and drink—duty free ...	14,043,683	13,795,999	-247,684
(B.)—do., dutiable	2,017,891	2,136,334	+118,440
§VI.—Raw materials for textile manufactures (including Flax, Hemp, and Jute)...	2,970,521	3,111,221	+140,700
§VII.—Raw materials for sundry industries and manufactures (including wood and timber, hewn, sawn, split, dressed; vegetable materials, for paper-making, &c.)	4,668,354	4,781,648	+113,294
§IX.—Miscellaneous articles (including Clover, Grass, Flax, Rape, Linseed) ...	1,056,808	1,296,910	+240,112
(B.)—Parcel Post ...	45,640	43,102	-2,538

From the food section of the Returns we make our usual extracts, as follows:—

IMPORTS.	1892.	1893.	Difference.
Fruits, raw:—			
Apples ... bush	339,251	220,923	-118,328
Cherries	31,356	4,613	-26,743
Plums	226,977	247,142	+20,165
Pears	272,152	271,827	-325
Grapes	171,928	148,844	-23,084
Unenumerated	161,582	212,209	+50,627
Onions	358,855	510,961	+152,106
Potatoes	75,950	60,765	-15,185
Vegetables, unenumerated, raw, ... value	£143,736	£148,994	+5,258

THE EXPORTS

for August show a decline of £521,152—which reads to us coal, coke, and artificial fuel; and the reader need not be told how much the coal strikes have had to do with this, and with operations in other industries. But for this unfortunate conflict, our exports during August would have been in excess of last year, and the general winter outlook much better than it now is. Exports have increased to India, China, and British South Africa; it would be pleasant to include other far-off colonies. Instead of this, from Tasmania trade accounts are somewhat disheartening, owing to the protectionist craze in that part of the world. By a sort of McKinley tariff that land is cut off from the rest of the world. Thus, it turns out that the only thing cheaper in Tasmania than in England is meat, and that costs twice as much as in any other of its sister colonies. Farm produce costs about the same as in England, but more in winter than with us. Furniture, clothing, groceries, &c., cost twice as much as in free-trading England. It is to be regretted that in this lovely and fertile country, poverty should be showing itself amongst its scant population. It might be worth while to know what important "native industry" requires so prohibitive a tariff as that saddling the progress of our far-away colonial friends; and they might with advantage be advised to try back on British lines. As to the operation of tariffs nearer home, the new French Chamber will probably have something to say respecting that which has been found wanting with them; even its author, we are told, begins to doubt the expediency of existing import duties.

"DICTIONNAIRE PRATIQUE D'HORTICULTURE."—The last part (16) completes the first volume of the French re-issue of what has got to be called Nicholson's Dictionary. It contains many additional

articles and illustrations, so that those who have the original work will not find the French edition superfluous. It is edited by M. S. MOTRET, and published by OCTAVE DOIN, 8, Place de l'Odéon, Paris.

"KEW INDEX."—By an oversight in our last issue, the estimated number of names in the part just published was given as 43,000. It should have been 109,200, which is approximately correct.

THE CITY MARKETS.—Accounts recently published show a good business for the Corporation, even with the lack of profit on the most recent addition to the markets the property of the Corporation—Farringdon Fruit and Vegetable Market. The structure itself is not a very inviting one, inside or out, and the Corporation do not appear to be doing their best to attract wholesale men, but having obtained some as tenants, know how to keep them. Finding great complaints against the system of toll, and that the old market tenants did not hunger after stands, the tolls were abolished; now the rent per square foot is raised, and there is some strong language being used. By-and-by the place will become a retail market—competing with shopkeepers already severely handicapped by rates and taxes. Surely little can be said in favour of this mode of doing business.

THISTLES.—Baron Sir FERDINAND VON MUELLER has prepared for the Agricultural Department of Victoria an illustrated account of the commoner Thistles. None of these is indigenous in Australia, but having been introduced, they have thriven to such an extent, that a special law has been passed to facilitate their eradication. The first thing to do is obviously to be able to recognise the offender—and this is facilitated by the pamphlet before us—and to know his mode of life, which requires observation on the part of the cultivator. Meanwhile, it shows some remissness on the part of chemists and cultivators that they have not ere this been able to utilise these plants in some way. Has any analysis of a Thistle been made?

VEGETABLES FROM THE NORTH.—Prodigious numbers of the green aphid have this year invaded the market gardens around London, and as a consequence some kinds of green vegetables were ruined, and early became so scarce that the prices current at Johannesberg for Cabbages reigned in London, but only for a brief interval, for Scotland has been tapped for supplies, and the stream still continues flowing southward. Lancashire, Yorkshire, and Lincolnshire have sent on tributary supplies, and there are now always trucks of greenstuff running on the Midland Railway lines to the Euston Road. One salesman in the market at the station informs us that he distributes from ten to forty trucks per day, and he (Mr. PATRICK) says there is no diminution in either demand or supply. Little need to criticise the quality of the vegetable supply—some of it is simply superb. For some reasons greenstuff does not "take" so well at King's Cross as at the neighbouring station. The originator of the Cabbage trade at the market in the York Road, Mr. CRAVEN, says he is running sixty trucks a week of greenstuff from Lincolnshire. The trade here was begun during a plague of greenfly some eighteen years since, and has had its ups and downs.

BRANCHES CASTING THEIR TIPS.—This habit is especially affected by trees that are accustomed to cold climates. A. F. FOCOSTE has recognised it in certain American and other trees, viz., *Catalpa speciosa*, *Staphylea trifolia*, *Ailanthus glandulosa*, *Fescula hippocastanum*, *Tilia americana* and *platyphyllos*, which shed the tips of their branches at the end of the period of vegetation. He considers that this habit has been acquired in order to secure a determinate growth of the branches, and to obviate the useless expenditure of energy when the branches are killed back by winter frosts, as is always the case with many trees.

TROPICAL GARDENING IN BRITISH GUIANA.—We are frequently asked to mention a book on gardening within the tropics, and do not always find

it easy to do so in a way suitable to our correspondent's requirements. The present little book is well suited for its purpose. It is the work of Mr. J. F. WANN, who has had long experience as a gardener in the West Indies and in Guiana, and is published in Demerara at the Argosy Press. It deals with the general preparations, such as formation of drains, walks, hedges, shelters, &c., the construction and maintenance of the flower garden, the kitchen garden, and the orchard; and the last section is devoted to the several methods of propagation. All this is included within little more than 150 pages, so that it is evident the writer does not waste his words.

PHARMACEUTICAL CONFERENCE.—At the annual meeting of the Pharmaceutical Conference, held at Nottingham, and reported in the *Pharmaceutical Journal*, the President, Mr. CORDER, spoke of certain common herbaceous plants especially connected with medicine. "Special prominence was given to the noted *Herbal* of JOHN GERARD, written in the year 1596. GERARD, it was claimed, should occupy the first place in rank of those who cultivated herbaceous plants. Little had been done in that direction before his time, and he succeeded in growing more than a thousand species in a garden, the site of which was in the neighbourhood of the present Somerset House. But for the publication of his *Herbal*, however, he would probably have been quite forgotten in later times, the fame of SHAKESPEARE, SPENCER, BACON, and other famous individuals who flourished about the same time being likely to over-shadow that of the mere cultivator of plants. After describing the volume at some length, and explaining the plan followed by the author in its compilation, Mr. CORDER endeavoured to reclaim the early history of GERARD from the obscurity in which it is involved. He then spoke at some length of the different herbals published in England at an early period by CLUSIUS, TURNER, LYTE, DODDENS, and others; and reverting to GERARD's, detailed some of the curious information contained in it, including the description of the development of the 'barnacle goose.' Consideration was next given to the herbaceous plants of greatest interest, with special reference to GERARD's acquaintance with them. Thus the Hellebores, Aconites, Podophyllum, Poppies, and kindred plants, Anemones, Crocuses, Snowdrops, Irises, and Daffodils, all received attention in turn; and the veteran botanist concluded his remarks on his favourite subject by insisting that, though a love of plants is inborn and circumstances may foster the taste, yet even a very superficial knowledge of botany cannot fail to prove of some value to all."

CALIFORNIAN FRUIT.—A Californian correspondent sends us the following from a San Francisco paper:—"Sixty-six carloads of fruit were hauled over the summit of the Sierra Nevada yesterday on their way east, while the daily average for some weeks has been between 50 and 60 cars. Six 12-wheel compound locomotives are doing little else but hauling these fruit shipments. It generally requires two of these big locomotives to pull 20 loaded cars up the steep grades and through the snowsheds. Each car contains 24,000 lb. of fruit and 6 tons of ice, while the weight of each car is about 22 tons. Recently, 1550 carloads of fruit were sent east from Sacramento. For the same period last year the cars numbered 1100, or an increase for this year of 450 carloads. This large increase is attributed to the fact that the fruitmen, being unable to sell much fruit to the canners this year, are selling as much as they can in the eastern markets. The increased shipments have made it necessary for the railroad to haul hundreds of cars back from the east empty to fill the demand for more cars here."

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY: AUGUST 12.—First-class Certificates were awarded to Messrs. de Graaf Brothers, Leyden, for *Anomatheca grandiflora*; to Mr. Walraad, Boskoop, for *Magnolia Alexandrina*, for var.; to Messrs.

G. H. Krelage & Son, Haarlem, for *Montbretia cocciniflora*, fl.-pl.; to Mr. C. G. van Tubergen, Haarlem, for *Crinum Powelli* intermedium, *Hamanthus Katherinae*, *Satyrium carneum* princeps; to Mr. C. A. Hiebendaal, Hees, for *Ahutilon hybridum marmoratum* var. *Jules Marty*. Second-class Certificates were awarded to Messrs. J. van den Berg & Son, Amsterdam, for *Leucanthemum lacustre*; to Mr. H. Gerretsen, Hees, for *Begonia semperflorens*, *Vernon*, fol. var.; to Messrs. Krelage & Son, Haarlem, for *Gladiolus Marcel Prévost* and Dr. Regel, *Asparagus Sprengeri*, *Cactus Dahlia Zwerg*, *Cactus*, *Begonia tuberosa*, *Albert Crousse*. Botanical Certificates to Messrs. de Graaf Brothers, Leyden, for *Tigridia van Houttei*; to Mr. C. G. van Tubergen, for *Lycoris squamigera*. Votes of Thanks to Messrs. G. H. Krelage & Sons, for a collection of eighteen varieties of *Phlox decussata*, *Begonia hybrida*, *Tige de fer*; to Mr. Zur Kleinschmiede, of Deventer, for collection of zonal *Pelargoniums*; to Messrs. van Namen Brothers, of Zwijndrecht, for *Aster sinensis*, *Reine des Célèbres*.

THE WEATHER IN BRUSSELS.—The Chestnuts in the Avenue Louise, Brussels, last year flowered a second time in mid-autumn. This year a similar phenomenon has occurred, but even earlier in the season. The row of trees bordering the tram-line, and most exposed to the sun, had a fortnight ago the foliage scorched up by the heat. Now, these dead leaves are all falling, and new tender green leaflets are coming out in great numbers on all sides, and racemes of bloom are appearing. Truly, it is a spring before the autumn. Eight days ago, on August 25, in the markets of Brussels a second Strawberry crop was on sale, the result of the exceptional summer.

ORCHIDS AT M. PEETERS' AT BRUSSELS.—We noticed lately in the houses of this establishment the handsome *Miltonia Peetersii*, Rehb., a natural hybrid between *M. Clowesi* × *spectabilis* Moreliana and *Cattleya Schofieldiana*, Rehb. These two fine Orchids have been already described in the *Gardeners' Chronicle*. Very pretty also are *Sobralia xantholeuca*; *Oncidium ornithorhynchum* still rather rare, and the rare *Miltonia vexillaria* superba, Rehb. A *Cattleya Victoriae* Reginae in flower was so similar to *C. guttata* Leopoldi that we were at a loss to distinguish them. *Ch. de B.*

GERANIUM MITE (PHYTOPTUS GERANII).—Mr. BURRIDGE sends us specimens of *Geranium sanguineum* in which the upper leaves are crowded in tufts, each leaf incurved at the margin, and often of a clear crimson colour, so that the deformity, for such it really is, is highly attractive in appearance. We learn that acres of ground on the Hill of Howth are covered with these tufted growths, which are the result of the irritation consequent on the puncture of the young leaves by a mite known as *Phytoptus geranii*.

CONTINENTAL WOOD-WOOL.—Messrs. W. WOOD & SONS, of Wood Green, send us a sample of their "wood-wool," which is unusually elastic, clean, free from odour, and of a clear white colour, qualities which render it well suited for packing fruit.

UGANDA.—Our correspondent, Mr. SCOTT-ELLIOT, previously known by his travels in Madagascar and Sierra Leone, has obtained a grant from the Government Grant Committee of the Royal Society for the purpose of exploring Uganda.

L'ORCHIDÉENNE.—At the meeting on September 10, the following Certificates were awarded: Diploma of Honour, First-class: to *Anguloa eburnea* Linden, from M. Linden. Diploma of Honour, Second-class: to *Maxillaria callichroma*, from M. Linden; to *Galeandra Claesii*, from M. Linden. Botanical Certificates: to *Saccolabium* sp., from M. Linden; to *Dendrobium bracteosum*, from M. Linden; to *Maxillaria* sp., from M. Linden; to *Bulbophyllum* sp., from M. Linden; to *Phalaenopsis* sp., from M. Linden. Certificates of Merit, First-class: to *Warscewiczella Lindenii*, from M. Linden (par acclama-

tion); to *Cypripedium Morganiae*, from Madame Block (par acclamation); to *C. Elliottianum*, from Madame Block (par acclamation); to *Odontoglossum crispum* Caparti, from M. le Dr. Capart; to *Miltonia spectabilis* Moreliana, from M. Linden; to *M. s. radians*, from M. Linden; to *Aganisia ionoptera*, from M. Linden; to *Cattleya eldorado alba*, from M. Linden; to *Cypripedium* × *Spicero-hirsutissimum*, from M. Linden; to *Paphinia grandis*, from M. Linden; to *Phalaenopsis violacea*, from M. Linden; to *Odontoglossum crispum* var., from M. de Moerloose; to *O. Andersonianum*, from M. Linden; to *O. praestans*, from M. Linden; to *Aganisia tricolor*, from M. Linden; to *Laelia elegans* var. *Leeana*, from M. Linden. Certificates of Merit, Second-class: to *Cypripedium oenanthum superbum*, from M. Linden; to *Habenaria militaris*, from M. Linden; to *Stanhopea Wardi*, from M. Linden; to *Laelia elegans* var., from M. le Dr. Capart. Cultural Certificates, First-class: to *Cypripedium Wallaerti*, from M. Linden; to *Odontoglossum crispum*, from M. le Dr. Capart.

FLOWER SHOWS.—We have received reports of flower shows at the following places:—Tynemouth, on the 5th inst.; the annual show of the Tynemouth and South Northumberland Horticultural Society, Ponteland Floral and Horticultural Society's show, on the same day.

LILY OF THE VALLEY.—As examples of flowers out of season, but still welcome, we received from Mr. THEODORE JANNOCH, of the Lily Nursery, Dersingham, some fine flower-spikes of Lily of the Valley. In the letter that accompanied these, we are informed by him that he has not been without blooms of the Lily of the Valley since last November, and he will be cutting for some weeks longer. He doubts if this feat has ever been exceeded or equalled.

SOLANUM WENDLANDI.

This is one of the best of the many good garden plants for which English horticulture is indebted to Kew in recent years. It was introduced from Costa Rica many years ago by Mr. Wendland, the Director of the Botanical Garden at Herrenhausen, in Hannover, where it was cultivated in a pot in a greenhouse. In 1882, Mr. Wendland presented a plant of it to Kew, and recommended liberal treatment for it,

FIG. 55.—SOLANUM WENDLANDI: FLOWERS PURPLISH-BLUE. (SEE P. 338.)

when, he said, its ornamental character would be revealed. It was therefore planted in a shallow bed of rich soil in the porch of the Water-Lily-house, and as the stem grew, it was trained through into the house, and its shoots allowed to grow about and hang from the rafters of the house. Its growth was rapid during the summer, and in the winter it cast most of its leaves and rested. When the house was started again in April for the Nymphaeas and tropical Gourds, the Solanum pushed rapidly into growth, producing long soft shoots clothed with bright green succulent, pinnately-lobed leaves, and terminated by broad cymose, many-flowered heads, the largest heads measuring over a foot in diameter, and when at their best producing a truly gorgeous effect as they hung from the roof of the house and were reflected in the water wherein the Nymphaeas grew. Every year since then this Solanum has been most effective in the early part of the summer, flowering profusely, and keeping up a display for fully three months. This year the plant promised to produce a second crop of flowers. Each flower is from $1\frac{1}{2}$ to 2 inches across, and is coloured purplish-blue, with the club-like cluster of stamens coloured yellow. The stems and leaf-stalks, when young, are clothed with short soft hooked prickles, and the persistent base of the petiole becomes blunt and corky with age. The old stem of the plant in the Water-Lily-house is now 2 inches in diameter. Mr. Wendland says this species is wild in the colder regions of Costa Rica, where it climbs trees, and where its effect when in flower must be particularly fine. In a greenhouse here it was not a success, whereas nothing could be better than the behaviour of the plant in the hot, moist, sunny conditions of the Water-Lily-house. A second plant may be seen at the tropical end of the Succulent-house, where it is planted in the bed at the side in a shallow layer of soil, and its shoots are trained along the rafters. Here also it grows well, and flowers freely, some of the heads of flowers being quite as large as the largest produced by the plant in the Water-Lily-house. One may deduce from this that Solanum Wendlandi thrives in a hot, sunny house, preferring a moist atmosphere in the summer, and dryness at the roots and overhead in winter. Cuttings of the leafless shoots in early spring, or of the growing shoots in autumn, will root if planted in very sandy soil and kept in a glass frame, but considering the free-growing nature of the plant, it is not what one would call an easy plant to multiply in this way. It has never ripened seeds at Kew. There is a figure of the plant in the *Botanical Magazine*, t. 6914, where it was named by Sir Joseph Hooker in compliment to Mr. Wendland, to whom we are indebted for a great deal of valuable work in horticulture, as well as in botany, and who is full of admiration for, and loyalty to, Kew, where he worked as a young gardener forty-four years ago. *W. W.*

HOME CORRESPONDENCE.

RETARDED GROWTH IN A PEAR TREE.—In the early spring of last year I bought, amongst other trees, at a sale in Covent Garden, a Williams' Bon Chretien Pear, which was duly planted. All through the summer it never came into bud, although the wood kept green. This spring it was taken up and put in an out-of-the-way corner, for I did not expect anything to come of it. But, strange to say, after not moving in any way for a year, it came out in bud, and is growing fairly well. All I have spoken of about it have never heard of anything of the sort before. *H. D. Heavn.*

GROWTH OF LARCH AND OTHER CONIFERS.—In a letter from Mr. Wellwood H. Maxwell, of Munches, Kirkcudbrightshire, N.B., he says—"I have been very much interested in reading the accounts of the excursion of the Royal Scottish Arboricultural Society among the woodlands in the south of England, which must have been a most enjoyable one to all arborists, and especially the sight of the grand old trees which were seen in such numbers. In the accounts of the younger planta-

tions, which are always of great interest to arboriculturists, I was much struck with a statement regarding the growth made by young Larches in plantations on the Marquis of Salisbury's estate at Hatfield; the tallest of which in twelve years after planting, had attained to a height of 32 feet, and all the trees in the wood had made an average of about 20 feet in height. I got my forester to measure some trees in a small wood here, the former crop of which was laid low in the fearful storms of 1883, with the following results: Larch, planted in 1885, 24 feet high, with an average height of 18 to 20 feet. Douglas Fir, 17 to 20 feet; Scots Fir, 15 to 18 feet; and Corsican Fir, 15 to 17 feet; all the average heights at eight years planted. It has been a most curious season, but notwithstanding the long and severe drought, trees generally have made good growth; most of the hardy Conifers have made from 2 to 3 feet. A few trees of *Larix leptolepis* have made quite 3 feet of growth, and are thriving well. There is very little seed on Conifers this season here, including the Larch and Scots Fir. The only forest trees with any quantity of seed upon them are the Ash and the Horse Chestnut, which are perfectly loaded; and on some of the Oaks acorns are a plentiful crop. *D.*

THE FRUITING OF LAURELS.—I never remember to have seen so much fruit on the various kinds of Laurels as this year; especially profuse are the bunches of fruit on the Colchic Laurel—bunches of a dozen berries coming in a cluster, and they look so much like black Cherries in shape, as to be scarcely distinguishable when mixed with those fruits. Even the Caucasian Laurel, which seldom bears fruit in this country, is laden; while bushes of the common type are almost broken down with the weight of fruit. *E. M.*

ABIES ALCOCKIANA.—Speaking of blue Conifers, let me put in a word for *Abies Alcockiana* as one of the hardiest and most beautiful; indeed, it may—when the under-sides of its leaves are seen—be said to be a white Conifer, and its spring growth is of a rich chocolate-crimson. With me in West Yorkshire it suffers neither from winter snows and frosts, spring winds, nor summer droughts; and it seems from its infrequency to be an unduly-neglected tree. *R. Milne-Redhead, Holden Clough, Clitheroe.* [Probably, *Picea ajanensis* is meant. *Ed.*]

TWO CROPS OF NEW POTATOS IN A YEAR.—My previous note on a succession crop of early Potatos on the same ground requires a rather curious sequel to complete it. Our first attempt to boil them in the usual manner, starting with boiling water, was a failure; our second attempt, boiling for an hour, was also a failure, and we only succeeded by starting them in cold water, like old potatos, and boiling for over an hour. The result was, the appearance of new Potatos, and the flavour of old ones; and we have decided that the attempt, although apparently a success, was a distinct failure in practice. *Thos. Fletcher, Grappenhall, Cheshire.*

THE GRAPES AT WARWICK CASTLE, WARWICK.—In the several lofty vinerias in Warwick Castle Gardens are to be seen good examples of Grape-growing, in the way of unusually fine Black Hamburgh, Black Alicante, Gros Colmar, Muscat Hamburgh, and the now not often met with Black Prince, the bunches of the latter being tapering and full, and the berries large and, as is usually the case with this variety of Grape, perfectly coloured, and carrying a heavy bloom. The same may be said of a Muscat Hamburgh Vine carrying twenty-six bunches, of fine size, and beautifully-coloured! Note this, ye Grape growers, who experience difficulty in colouring a crop of this excellent Grape, consisting of one-third the number of bunches indicated. This Vine is growing at, I believe, the west end of the range of vinerias, and therefore got the full benefit of the afternoon's sun. The crops of the other varieties mentioned above also bear evidence of cultural skill, and of the special requirements of the Vines, soil, root and branch, and atmospheric conditions being thoroughly understood and judiciously attended to. The Black Hamburghs are especially good, being fine in bunch, berry, and finish. *W.*

FRUIT FARMING.—Perceiving that sundry opinions as to the profit of fruit-growing are now set forth in your columns, I venture to state my experience. I have been engaged in that pleasant pastime since the year 1857, having bought some 12 acres for the purpose. For many years I gave my entire attention to it, sparing neither money nor labour. But during all those years I have not suc-

ceeded in securing proceeds enough to cover the wages alone, except for two golden seasons, and those two just met their expenses. The land is well suited for the purpose, but I have lost many thousands by this insane investment. *R. D. Blackmore.*

VICTORIA REGIA.—If you have not already had too much about the Victoria, will you permit me to corroborate "W. W.'s" statements as to the leaves and their upturned edges? I have grown the Victoria with a fair amount of success for fifteen years, and I have watched it closely during this period, and noted its behaviour. I plant it out early in April, and the young leaves, until they reach about 2 feet 6 inches in diameter, lie flat on the water. At this stage the edges begin to turn up, until when the leaves reach their maximum development early in July, just before flowering commences, the upturned edge is from 3 to 5 inches, and it never flattens out on the water. The deeper the upturned edge, the healthier and more vigorous is the plant, and the larger will be the flowers. In 1879 I had a very poor plant. The edges were very slightly turned up, and the flowers were so poor that they were cut out to encourage leaf growth. In 1885 I had a plant with leaves 7 feet 2 inches in diameter, of great substance, and with deeply upturned edges. This was my best plant. When the Victoria commences to flower it produces with each flower a new leaf, and as it produces about eight to nine flowers a month, the leaves formed with these have not time to develop fully. Therefore, as long as the large leaves remain sound, the young leaves are cut out, so as to retain as long as possible the fine effect produced by five leaves filling the tank. Some of these large leaves have been retained until quite yellow, and in no case did the edges turn down in a healthy plant, but remained upright and strong, not "ragged at the edges," as stated by "V.," until cut out. About the middle of September flowering ceases, owing to reduction of temperature and light, and some fairly large leaves are again produced, and as the plant loses vitality later on, the leaves become smaller, and the edges cease to turn up, until the leaves again lie flat on the water, as they did with the young plant in April, and eventually they all decay away. This has been the behaviour not of one plant only, but of every good healthy plant which I have grown. *F. W. M.*

DAMPSHA MELON.—If your correspondent F. M. Bailey (p. 300), could get hold of the seed of this Melon I have named, it would be the very thing he is looking for; it keeps good two or three months after cutting, and is even then very good. It came from Persia about 1830 and was fruited in the Royal Horticultural Society's Gardens, Chiswick, and after that was lost sight of until 1847, when Mr. Wood, nurseryman, Maresfield, Sussex, gave some seed to my predecessor; and I, being foreman at the time, sowed the seeds and fruited it regularly year after year, and showed it in London, getting the second prize for flavour. It has the appearance of a green Vegetable Marrow, and very little care was required in its cultivation, simply making it a second crop after Potatos in a common frame. I remember the weight was 3 to 5 lb., and that there were generally fifteen fruits in a three-light box. One year I made an experiment with a pit of them; the pit was deep, and soil was put in as usual, and the plants planted, but I treated it like a Wardian case, and it was never opened for air till the crop of fruits was ripe, which were fairly good. *J. Rust, Eridge Castle.*

NYPHÆA LAYDEKERI VAR. ROSEA (Marliac).—It may interest your correspondent "T." (p. 299), to hear or know that the above hybrid Water Lily was raised by M. Bary Latour-Marliac, the celebrated specialist, at Temple-sur-Lot, France. It passed through last winter safely in the College Gardens at Dublin, as planted out in the deep rich mud of a cold-water pond, and has flowered freely all the season. It is of a deep rosy-carmine colour inside its petals, and a lovely soft bright rose colour outside, and is a choice companion for *N. pygmaea*, white, and *N. pygmaea helvola*, clear yellow, with orange centre. I should be glad to know on what authority "T." assumes or infers that this dainty little plant came from Japan? It was, as M. Marliac informs me, raised in his establishment in France as a hybrid. *F. W. B.*

—It may interest your correspondent, "T." (who writes about this plant in your last issue), to know that this pretty new Water Lily, which I received early in June from its introducer, Mons. Bary Latour-Marliac, has been blooming almost continuously ever since in the open

air in my garden, planted in a half paraffin-barrel, and that it is still in flower, with several more buds to come up. I believe it will prove quite hardy, and if so, it will be undoubtedly a great acquisition to our gardens, as, though its flowers are not large, they are produced in great abundance, and I consider it quite the prettiest hardy Nymphaea I have ever seen. I hear that Mons. Marliac, who devotes his attention solely to the introduction of new Japanese Bamboos and Nymphaeas, has some most beautiful novelties of the latter family, presumably of his own raising, now in flower, which will ere long be distributed by him to the public. These are said to be wonderful advances in colour. *N. Marliacea ignea* is an addition to that remarkable series, and has deep purple-red flowers. Another, named *N. M. rubra punctata*, is very interesting and striking in colour, being rosy-red over a lighter ground, the colour being laid on, as it were, in innumerable little dots. A third variety is also very charming, being of a soft salmon and rosy tint, with a rich yellow centre. These new Water Lilies are by far the most important things of the kind that have been ever raised. *W. E. Gumbleton, co. Cork.*

MAIZE—Mr. T. Fletcher must have been very unlucky with his Maize. I have grown acres of the plant, and never had any difficulty in producing plenty of cobs from plants 3½ to 6 feet high. For early use I sowed seeds in pots the first week in April, and planted out in trenches as soon as all danger of frost was gone. For later use, the seeds were sown in the open in the first week in May. I used to cut the cobs from the middle of August to the latter end of September, very often as many as four dozen a day. The trenches were prepared as for Celery. The seeds were always obtained from Peter Henderson & Co., nurserymen, of New York, U.S.A., who supplied us with many varieties. *J. F. Morgan, Gosfield Hall Gardens, Halstead, Essex.*

MARKET PRICES.—May I offer just a word of advice to market growers in general. Would it not be far better if growers were to try and develop local trade rather than rush all their produce on the London market? I could give cases that have come under my notice where produce has gone to London and has been returned to the local tradesmen of the same district at lower prices than the grower would sell it for on the spot, thus having to pay carriage and commission, and then accept less than local men were willing to pay for them, and at the same time making a glut upon the market and lowering the price accordingly. One of the most fruitful causes of disappointment to senders is the untrustworthy character of the market reports that appear from time to time in the garden papers. Who is responsible for them I cannot say, but it leads numbers of people to engage in what would appear a most lucrative business, making things worse than they were already for other growers, by increasing the supply which has been so long above the demand (especially in the cut flower trade), and bringing loss and disappointment upon the poor dupes. Until some new and trustworthy system of reporting market prices can be found, disappointment must accrue to those who engage in the business. In to-day's report Gardenias are quoted at 2s. to 4s. per doz., and a man whom I was talking to, who has been growing them especially for Covent Garden and West-end shops, assured me that 9d. per dozen was by far more like the price they are fetching. Why do not all growers form themselves into a society, and pay a responsible person or persons to make true and trustworthy reports as to the prices and supplies, thus saving disappointment to many, and at the same time regulating the supply, which would tend to keep the prices up to such a standard that would ensure a profitable return to growers? *Grower.* [Has "Grower" ever observed the paragraph which for many years we have been in the habit of placing over our market reports? Ed.]

DROUGHT-ENDURING FLOWERS.—Wishing to note the plants that have stood the ordeal of this hot dry summer best, I recently paid a visit to Messrs. Cannell's Flower Farm at Swanley, where less rain has fallen than in South London. Mr. Cannell told me that as some compensation for the scorching which flowers and foliage have received, many kinds of seeds that sometimes fail to ripen have this year been saved in very superior condition. For instance, fancy and show Pelargonium seed is unusually good and abundant. All the varieties of zonal Pelargoniums have rejoiced in the bright sunshine, proving how indispensable they are for bedding purposes. The variety John Gibbons has been benefited by the drought and heat, as they have checked its usually too-free growth, throwing it into flower and ripening

its wood. The semperflorens varieties of Begonias, have succeeded as bedders better than the tuberous Begonias. Many varieties of Sunflowers, Eryngiums, Gaillardias, Zinnias, Marigolds, Tropaeolums, Auribiums, Callas, and Enocheras have flowered well and continuously; and I noticed that the seed-pods of *Ceanothera macrocarpa* have assumed monstrous proportions, being quite a curiosity in their way. Dahlias seemed full of promise, being less drawn and more robust than usual, the Cactus section especially. *W. R. Streatham Hill.*

PLUMIERIA BICOLOR.—On entering the stove at Scone, a plant in flower of the above caught my eye at once. The fleshy deep green sheeny leaves are produced at the end of the branches; the flowers are funnel-shaped, pure white, with a yellow throat, and are produced in great profusion. No more effective stove plant could be desired. Plumieria is a genus of Apocynaceae, and is a native of the north of South America. *P. rubra* is so sweet scented, that it is called the Red Jasmine in the West Indies. I trust that other cultivators of this shrub will bear testimony to its value. I have learnt wisdom, or at least, caution, so I am not going to declare that Mr. McKinnon is the only grower of this shrub. *Vagabond.*

OVERCROWDING VINE SHOOTS.—I never can understand how it is that so many gardeners who really ought to know better allow the shoots on their Vines to become so crowded. It is not the lateral growths that I allude to, but the excessive number of shoots allowed to remain on one spur when disbudding. It is not unusual to walk into a viney and find as many as three and sometimes four shoots growing on one spur. Very often only one of these shoots is allowed to carry fruit. What then is the use of crowding the space which another ought to have, I would ask? As a rule, one shoot to a spur is quite sufficient, although there are times when, through an accident to a growth on the opposite or same side, the retention of an additional shoot to fill up what would otherwise be vacant space, may be allowed. In such a case, however, the main foliage of the principal growth from this particular spur is not crowded by this auxiliary shoot. In asking the person in charge why so many surplus shoots are left on the Vine, the answer invariably is that much foliage increases the number of roots. No one would question the principle that root action is largely governed by the leaves and *vice versa*; but then it is leaves that are of requisite texture and maturity that go to build up the buds at the base of every eye in connection with a due root-growth. Vines that are yearly overcrowded by a useless retention of shoots seldom, if ever, produce first quality fruit. Take Muscat of Alexandria, for instance; no Grape that I am acquainted with resents overcrowding of the foliage more than this. On such the bunches are long and thin, and devoid of that squareness of shoulder, so characteristic in a well-developed specimen of this Grape. If the best results are to be obtained, the wood must be annually matured, and this can only be done by a due regulation of growth and sufficient space for every shoot. It is the four or five leaves on the shoot nearest to the main rod that need light and exposure to obtain the necessary solidity to enable them to perform their functions, so as to ensure a full and satisfactory crop of fruit the following season. Where three shoots are growing from one spur, how can they all enjoy that position which is essential to success? The practice of removing entirely all lateral shoots below the bunch largely prevails among successful Grape growers, and for a very good reason, prevention of overcrowding of what I term the salient leaves as feeders to the Vines by the lateral growths. *E. M.*

FRENCH WRITERS ON PRUNING—Some of the assertions in M. Lequet's paper, which you were good enough to give us recently, are truly amazing, as, for example, one to the effect that "unpruned Apple trees do not bloom till they are eight or ten years old, and only bloom well once in two years then." I do not believe there is an Apple in cultivation that takes so long to flower and fruit, and I do know many prolific sorts that begin to bear the second and third year after planting, even on the Crab stock—Lord Suffield is a notable example. I have seen trees laden the second year after they came from the nursery with three or four one-year-old shoots on them. It is entertaining, next, to be told that it "has become an aphorism since the careful experiments of M. Hardy" that "all the branches which are left unpinched on a Cherry tree are so many fruit-bearing branches." I should have thought that anyone who ever saw a year's tree growing wild

knew this well enough without experiments of any kind. An unpruned and unpinched Cherry branch produces just a wreath of blossom and fruit from end to end. I daresay I could forward you loads of branches from 6 to 10 feet long like this in the season. Is the word "unpinched" correct here? As to pinching Peach trees, also favoured by M. Lequet, an English gardener has just to see the model trained trees in France to be disenchanted. I have seen what I was told were among the finest examples of this kind in France, and I am perfectly sure that myself and many others in England have often produced trees that for quantity and quality of fruit would have beaten them "into bits" in about one-fifth of the time. Perhaps you are aware that the "extension" system of training Peaches has been introduced into some noted French gardens with success, but to the great disgust of the French men (I give you the name of one place privately). The proprietor had two noted gardeners—one for the ornamental part and one for the fruit department. He wanted Peaches grown in the English fashion, and put up a long house for the purpose, which was put under the flower gardener, with a young Englishman to grow the trees, which also were sent from London. These trees were in full fruiting swing before the French trainer could have had his foundation "stumps" hewn out, and great were the exclamations and gesticulations over them by the French gardeners. They, the trees, were "barbarous," they were "groase," &c., but the crops got over them, and let us hope the example will do good. No doubt, to a French Peach-trainer, what he calls a "glutton," or a Peach shoot 5 or 6 feet long, with maybe a dozen fertile sub-shoots on it, and all the production of one summer, would be novelty such as he never contemplated. It would take him ten years to produce an equally fruitful shoot. *Extension.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 12.—At the meeting of this Society on Tuesday last at the Drill Hall, James Street, Westminster, the number of exhibits was much smaller than usual. Violas, Dahlias, and other seasonal flowers were well shown, especially Roses, which were quite exceptional for this season of the year.

Floral Committee.

Present: W. Marshall, Esq., in the chair; and Messrs. C. T. Drury, H. B. May, R. Dean, G. Stevens, F. Ross, J. D. Pawle, H. H. D'Ombraun, J. T. Bennett-Poë, C. Noble, C. E. Pearson, G. Gordon, and P. Barr.

A first-class collection of cut flowers was staged by Messrs. Dobbie & Co., Rothesay, N.B. The Violas, which were arranged in pretty sprays, upon black velvet, were very fine. The most striking of these were Archibald Grant, a fine bright purple; Dawn of Day, Duchess of Fife, Lucy Ashton, Bride-maid, Duchess of Sutherland, Blue Cloud, and Columbine. There were some pretty new single Dahlias, and also a new strain of single varieties, having the petals reflexed along the margin and tapered at the point. This new form of Cactus Dahlia will be prettier arranged in vases than the ordinary single, and we believe that, in another season or two, some very useful varieties with these characteristics may be raised. The best of those shown were Meg Merrilies (yellow), Guy Manoeing (white), and Ivanhoe (rose). (Silver Banksian Medal.)

A good group of cut Roses and a few herbaceous flowers were put up by Messrs. Paul & Son, Chesnut. An Award of Merit was given to Noisette Rose Adelina Viviani Morel, a small but pretty bronzy-pink flower, and very floriferous; also to shrubby Phlox Moliere, a very soft, beautiful pink bloom, of large size and excellent form. A few plants in flower of the blue Clematis Davidiana were also included. This species has terminal heads of bloom, and a few that are axillary; the habit is erect, and the height of those shown was 2 feet to 3 feet (Silver Flora Medal).

Another collection of cut Roses was from Messrs. W. Paul & Son, Waltham Cross, Herts; these blooms were of good quality for autumn Roses. The new H.P., Clio, shows fairly well at this season. Bunches of Tea, Marie Van Houtte, and the new China Rose, Duke of York, which received an Award of Merit a fortnight ago at the Agricultural Hall meeting, looked fresh and pretty (Silver Flora Medal).

Messrs. Jas. Veitch & Sons, Chelsea, had a collection of their new hybrid *Streptocarpus*, showing continued improvement in form, and especially in the colours, which are much deeper and brighter. These are fast becoming the most charming of greenhouse flowering plants. Also a group of their *Rhododendron javanico-jasminiflorum* hybrids, including a few that are new, which show larger flowers and corymbs than most of the earlier-raised varieties (Vote of Thanks).

A group of *Cannas* came from the Royal Horticultural Society's Gardens, Chiswick, including some of the newest and best varieties of the English and continental raisers. An Award of Merit was recommended to one by Messrs. Vilmorin, Andrieux & Co. named *Quasimodo*, a large flower of very bright scarlet, with narrow gold margin.

A few spikes of *Pentstemon*s came from Messrs. Stuart & Mein, Kelso, N.B.; and some *Tuberoses*, which had been grown in the open, from Dr. P. H. Emerson, Claringbold, Broadstairs. Captain Le Blanc, Northam House, Potters Bar (gr., Mr. May), sent twelve blooms of a show *Dahlia* Mrs. Le Blanc, very large and full, and quite white.

T. W. Girdlestone, Esq., Sunningdale, had a first-rate collection of single *Dahlias* in sprays, Goldenlocks (yellow), M.C.C., Demon (very dark purple), *Phyllis* (Hilac, flaked with rose and crimson), all obtained Awards of Merit.

A collection of China *Asters* was sent by Messrs. T. H. Crisp & Co., Clyn Valley Nurseries, Sketty, Swansea. These were of much better quality than we have seen them about London this season (a Bronze Banksian Medal).

Messrs. H. Cannell & Sons, Swanley, had a very pretty stand of *Cactus Dahlia* blooms, and Cannell's Gem was granted an Award of Merit. It is a red variety of rather small size, the petals much reflexed, and tips tapering to a point. Mrs. G. Reid is a very pretty combination of heliotrope and white, but its form is not good. The collection included a number of varieties, and the specimens were bright and good (Silver Banksian Medal).

Orchid Committee.

Present: Sydney Courtauld, Esq., in the chair, and James O'Brien (Sec.), Dr. M. T. Masters, F.R.S., A. H. Smee, Jas. Douglas, E. Hill, J. Jaques, H. Ballantine, T. W. Bond, and W. H. White.

Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), exhibited some very fine hybrid *Cypripedium*s, and the rare and very singular *C. præstans* (syn. *glanduliferum*), a very curious species, with flowers somewhat like those of *C. philippinense*, but with a large staminode, the broad middle of which is bright yellow, the sides yellow, thickly studded with short dark hairs. Among the hybrids were *C. × concolor-lawrencei* (concolor \times Lawrenceanum), with two large wax-like pale primrose flowers, thickly spotted with purple, proceeding from one spike; *C. × neo-superbiens* (*Enanthum × superbiens*), to which an Award of Merit was given; although we were under the impression that that award had been previously made to it. There was also a cut spike of *C. × Morgania burfordiensis*, which is by far the best form of that handsome variety.

Messrs. J. Veitch & Son, Royal Exotic Nursery, King's Road, Chelsea, exhibited some new and rare hybrid *Orchids*, foremost being *Cypripedium × Aphrodite* (niveum \times Lawrenceanum \times), being the reverse cross to *C. × Antigone*; the flowers were better than it had ever been seen before, and a First-class Certificate was awarded. The flowers were of the *C. niveum* form and colour, but very large, pure white, thickly spotted with purple. Another fine exhibit of Messrs. Veitch was *Lælio-Cattleya × Nysa* (*L. crispa* \times *C. Warscewiczii*), which bore some resemblance to *L. C. × exoniensis*, but the front portion of the lip was longer, and darker in colour (Award of Merit). *Dendrobium neoguinense*, like a white form of *D. macrophyllum* and *Lælio-Cattleya × epicasta* (*L. pumila* \times *C. Warscewiczii*), also came from the same firm.

Messrs. F. Sander & Co., St. Albans, staged an extensive group of very choice and well-grown *Orchids*, embracing *Lycaste Skinneri pulcherrima*, a grand form, nearly white; three of the brilliant vermilion *Habenaria militaris*, the same number of its equally pretty flesh-coloured companion, *H. carnea*; *Oncidium Jonesianum*, *Aërides Lawrenceanum*, *Angraecum articulatum*, *Zygopetalum Wailesianum*, six fine forms of *Miltonia spectabilis Moreliana*, the rare *Oncidium incurvum album*, *Cattleya Gaskelliana alba*, and several fine hybrid *Cypripedium*s (Silver Flora Medal).

Messrs. Hugh Low & Co., Clapton, also staged an effective group, in which were three plants of the beautiful new pure white *Stanhopea Amesiana*, several *Miltonia Roelzii*, the pretty white *Trichopilia Wagnerii*, *Cypripedium × marmorophyllum*, *C. euanthum superbum*, *C. × Brayanum*, *C. × picturatum*, and the singular but not handsome *C. Victoria Mariæ* (Silver Banksian Medal).

Messrs. Linden, l'Orticulture Internationale, Parc Leopold, Brussels, exhibited *Cypripedium × Clotilde Moens* (*Leeanum × Haynaldianum*), a pretty and floriferous hybrid, with flowers closely resembling those of *C. × Leeanum*, but borne three on a spike (Award of Merit).

R. J. Measures, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. Chapman), showed *Cypripedium Ganesa* (*Sallieri × Lawrenceanum Hyeannum*), *C. Hebe* (*Hookeri Measresianum × Lawrenceanum*), a fine bold and well-coloured flower; *C. Madame Cappe* (*Spicerianum × Dauthierii*), *C. radiosum* (*Lawrenceanum × Spicerianum*), *C. × Diana* (*superbiens × Spicerianum*), *C. picturatum*, *C. Schomburgkii*, and *C. × cardinale* var. (Bronze Banksian Medal).

Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a small collection of superb cut blooms of *Orchids*, of which *Cattleya Statteriana*, a nearly white-petalled *C. Hardyana*, was an admirable example of a unique *Cattleya*. Another curious species was a form of true *Cattleya Victoria Regina*, with greenish sepals and petals, shaded and veined with reddish-brown. Other fine things were *Lælio-Cattleya elegans* var. *Blenheimensis*, *Cattleya × Minucia*, *C. × Parthenia* (*fimbriata × Mossiae*), *Cattleya Leopoldi*, and the superb form of it, *C. L. Stand Hall* var. (Vote of Thanks).

H. G. Leon, Esq., Bletchley Park, Bucks (gr., Mr. A. Hislop), sent *Cypripedium Leone insigne* (*Chantinii* \times *callosum*), whose strong spike bore two flowers somewhat resembling those of *C. × Ashburtoniae*, but much larger, and better in colour (Award of Merit).

Norman C. Cookson, Esq., Oakwood, Wylam-on-Tyne (gr., Mr. Murray), showed a pretty hybrid (*Cattleya Dowiana* \times *Lælia pumila præstans*), the reverse cross to *L. c. × Ingrami*, and very closely resembling it. Chas. L. N. Ingram, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), sent *Cypripedium Adonis* (*hirutissimum × Curtisii*) and *C. Unique* (*Lindenii × Schlimii album*). Mr. J. O'Brien, Harrow-on-the-Hill, showed several spikes of *Satyrium membranaceum*. S. G. Lutwyche, Esq., Oakfield, Beckenham (gr., Mr. J. May), showed *Lycaste Skinneri* with two flowers on a spike. Mr. H. Elliott, Stourvale Nurseries, Christchurch, a good form of *Cattleya labiata Gaskelliana*; the Hon. Mrs. Foley, Fordingbridge, Hants (gr., Mr. Moxham), a profusely-flowered plant of *Cattleya labiata Gaskelliana*, with blooms much like those of *C. Mendeli Morganiae*.

Fruit Committee.

Present: Philip Crowley, Esq., in the chair; and Messrs. J. Lee, T. Francis Rivers, Harrison Weir, J. Chen, W. Warren, J. Wright, G. Bunyard, A. Dean, G. Wythes, H. Balderson, J. Smith, G. Norman, W. H. Divers, J. Hudson, T. J. Saltmarsh, and J. Willard.

Messrs. John Laing & Son, Forest Hill, London, S.E., staged a fine collection of Apples and Pears, in ninety dishes. Of Apples, Cellini Pippin, Lord Suffield, Emperor Alexander, Bismarck, Blenheim Orange, New Hawthornden, King of the Pippins, Cox's Orange Pippin, Stirling Castle, and Kerry Pippin were the most attractive. The best dish of Pears was General Todleben (Silver Knightian Medal).

Messrs. T. Rivers & Son, Sawbridgeworth, staged an excellent collection of orchard-house fruit, including Apples, Pears, Plums, and Peaches. All the specimens were of the best quality (Silver Knightian Medal).

Twelve dishes of Pears were exhibited by H. St. Vincent Ames, Esq., The Gardens, Cote House, Westbury-on-Trym, Bristol (gr., Mr. W. H. Banister).

Two dishes of very fine Lane's Prince Albert Apple, from a pyramid, were shown by the Rev. J. H. Brown, Bedstone Rectory, Shropshire; and Seedling Apples were exhibited by Mr. D. R. Carter, Petersfield Station; and by Miss Winckworth, Rochester.

Mrs. Crawford, Gatton, Reigate (gr., Mr. W. Slo-grove), had six dishes of Pears of remarkable size. The varieties were:—Doyenné Boussoch, Beurré d'Anjou, Doyenné du Comice, Marie Louise, Beurré

Diel, Conseiller de la Cour, and Fondante de Cuerne (Cultural Commendation). Twelve exceptionally large fruits of Peasgood's Nonsuch Apple were sent by the Bishop of Bath and Wells, The Palace, Wells (gr., Mr. J. B. Payne). The tree was planted against a wall, with south-east aspect, and a terrace behind, which has kept the wall cool, so much so that it is said no other fruit has succeeded in the position before this Apple tree. No fruit produced this season weighed less than 1 lb. in weight (Bronze Banksian Medal).

A new Grape, called Cape Muscat, was shown by Mr. Walter Weir, The Gardens, Acton Park, Wrexham. The fruit is black, of fair flavour, and solid flesh (Award of Merit). Lord Foley, Ruxley Lodge, Esher (gr., Mr. J. W. Miller), showed two dishes of excellent Barrington Peaches from trees outside, and a large fruit of King of the Melons Melon. Dr. P. H. Emerson, Claringbold, Broadstairs, Kent, showed five small Melons that had been grown in the open. The fruits were small, but the flavour was fair.

Messrs. Robert Veitch & Son, Exeter, had a few fruits of a new Peach Late Devonian. Mr. W. H. Divers, Ketton Hall Gardens, Stamford, had splendid Lord Palmerston Peach from a cool house, and some fruits of a seedling Peach named Duchess of York, described as of exceptionally good flavour and of good constitution (Award of Merit).

Messrs. W. E. Browne & Son, Wells, Somerset, sent six fruits of Monster Pippin Apple, and a dish of a variety called Bartlett's Glory (Award of Merit).

From Messrs. Sutton & Sons, Reading, came six bulbs of their Al Onion, and a dish each of the Windsor Castle and Sutton's Triumph Potato. The Potatoes were very fine, and all three subjects were awarded First-class Certificates.

The Society's Gardens at Chiswick contributed a collection of Onions in forty-six varieties, for comparison with each other.

Mr. W. H. Pitcher, Albury House Gardens, Surbiton, showed a dish of Tomatos (Vote of Thanks).

Lecture by Mr. James Douglas.

In the afternoon a paper by Mr. J. Douglas, on "Garden Phloxes and Pentstemons," was read by the assistant-secretary in the absence of the lecturer. Taking the *Pentstemon* first, Mr. Douglas described the species *P. Hartwegii* and *P. Cotæa* as the parents from which most of the garden varieties have been obtained. In regard to cultivation, the lecturer advised seeds to be sown on a hot bed in February, and as soon as large enough, to be transplanted, but kept warm for a little time, and afterwards hardened off by slow degrees. If propagated by cuttings, these should be taken in September or October, and put into handlights into good loam, leaf-soil, and sand. They should be kept in handlights until the spring, and plants grown in this manner would be useful for filling-up gaps in the herbaceous borders.

Phloxes were treated in a similar manner, a short history of the garden varieties preceding general remarks upon the cultivation most suitable to their requirements. Cuttings should be taken in the spring, as soon as sufficient growth has been made, and placed in a gentle heat. Plants raised in this manner are very superior to those obtained by division. If seed should be saved it must be gathered and dried carefully, and kept stored until February, when it may be sown in pots or pans, and placed over a hot bed in the pits. They can be flowered in pots if desired, and do exceedingly well; and they also flower to some extent the same season, if placed in the border.

Mr. A. Dean, in discussing the subject after the paper had been read, desired that amateurs should not believe that the culture recommended by Mr. Douglas was indispensable to the one plant or to the other, and declared that they would do extremely well and could be propagated very easily without any heat whatever. A few remarks from Mr. Bunyard concluded the meeting.

BRIGHTON AND SUSSEX NEW HORTICULTURAL.

SEPTEMBER 5, 6.—The second annual autumn exhibition of this Society was held in the Dome Corn Exchange and grounds, adjoining the Royal Pavilion, on the above date. The exhibits were tastefully arranged in the several buildings and two large marquees on the lawn, thus providing ample space for the visitors to inspect the various exhibits without getting crowded, as is too often the case in such places. Never, in our opinion, has the Corn Exchange presented such an attractive appearance, for down

each side of the building were arranged the miscellaneous groups in a most tasteful manner, while one end was occupied by a collection of garden sundries from Mr. Balchin, the other being devoted to a collection of fruit from Messrs. Cheal & Sons, Lowfield Nurseries, Crawley. Down the centre of the building were tables of plants, and on either side of these the numerous exhibits of fruit were staged, the whole presenting an attractive picture. The Dome was reserved for the most part as a promenade, collections of cut flowers being staged round the building. We noticed here some of the best collections of stove and greenhouse cut flowers that it has been our lot to see, notably those exhibited by Mr. Archer, gr. to Miss Gibson, Hill House, Saffron Walden. The Dahlias, too, were very good.

In the tents on the lawn were arranged the stove and greenhouse plants, vegetables, &c., of which there was a goodly show, particularly in vegetables, there being upwards of twenty exhibits in several classes, while in the fruit classes there were no fewer than twenty-nine entries for a dish of Pears. The competition was so keen in some of these classes, that the judges had a little difficulty in deciding. Should this society go on as it has begun, it will eclipse every other in the south of England.

For a miscellaneous group, occupying 150 square feet, the 1st prize fell to Mr. Wells, Shirley, Southampton; the 2nd going to Mr. W. Peel, of the same place. For a miscellaneous group arranged for effect, occupying a space of 80 feet, 1st, Mr. G. Sims, Dyke Road, Brighton. For a group of Ferns, Mr. J. Adams, Coombe Place, Lewes, was 1st. For the best tables of plants arranged for effect, 1st, Mr. Miles; and for a table of Begonias, 1st, Mr. Murrell, Manor House, Preston.

Mr. Portnell, gr. to Sir A. Lamb, Battle, was 1st for a collection of flowering stove and greenhouse plants; while in that for six foliage plants, Mr. Warren, of Handcross Park, was 1st. The last-named exhibitor was also 1st for six Ferns. Mr. E. Meachen was 1st for six Crotons, and Mr. Warren for six Dracænas. Mr. J. Turner was 1st for six Palms.

For six table plants, 1st, Mr. Miles; while Mr. H. Garnett, Mount Harry, Preston, was 1st for Orchids. For six Fuchsias the 1st place was awarded to Mr. Meachen; Mr. Murrell taking the same for six Pelargoniums. In the class for six Begonias, Mr. H. Head, of Hove, was 1st; and for that of Coleus, Mr. G. Sims. For a specimen ornamental plant, Mr. Warren was 1st, with a grand plant of Croton, and likewise for a specimen flowering plant.

Cut Flowers.—These were strongly represented, the 1st prize in Class 23 for twenty-four varieties going to Mr. Archer, Saffron Walden; and for that of twelve varieties to Mr. T. Portnell. Mr. G. Garroway, Nurseries, Bath, was 1st for twenty-four Roses; and Mr. Harris of Horsham, was 1st for twelve Roses. Mr. Garroway was 1st for twelve Teas. For forty-eight Dahlias, Mr. G. Humphries, King's Langley was 1st; and for twenty-four the highest award fell to Messrs. Cheal & Sons.

For twelve Dahlias, 1st, Mrs. F. E. M. Ronalds; Messrs. Cheal being 1st with single-flowered Cactus and pompon varieties.

For a collection of herbaceous flowers, Mr. Goldsmith, gr. to Sir E. Loder, Leonards Lea, Horsham, was 1st; and for a collection of annuals, Mr. Garroway. Both Asters and Pelargoniums were good, and Mr. Fowler and Mr. Wickham took 1st respectively. Mr. Chard was 1st for bridal bouquets, wreaths, centre table vase, and basket of flowers.

Fruit.—This was exhibited in good form, and there was a strong competition in most of the classes. For a collection of fruits fit for table, 1st, Mr. L. Budworth, gr. to C. Hill, Esq., Rockhurst. For three bunches of Black Hamburg Grapes, 1st, Mr. A. Kemp, gr. to R. S. C. Dickens, Esq., Horsham; and for any other variety, 1st, Mr. J. Bury, Forest Hill, S.E., who was also 1st for white Grapes, shown in three bunches. Melons were well represented for two fruits, one scarlet and one green-flesh. Mr. G. Stovell was 1st.

A variety of out-of-doors fruits were shown, the produce generally being of a high degree of excellence. The 1st prize for two dishes went to Mr. J. Coles, and that for two dishes of Nectarines to Mr. Offer, Handcross Park.

Vegetables.—There were five entries for nine kinds, and four for six kinds. The 1st prize in the former went to Mr. Garroway, of Bath; Mr. A. Ward taking 1st in the latter class. For six varieties of Potatoes, Mr. Kemp was 1st. Peas were the best we have seen for some time, those of Mr. Rapley's, that took 1st, being particularly good. Tomatos, especially

the 1st-prize lot shown by Mr. Garroway, were excellent. There was also a strong competition in Cucumbers, Mr. G. Helman, gr. to Viscount Gage, taking 1st.

Of the miscellaneous exhibits, not for competition, Mr. Piper of Uckfield, and Mr. Woolard, staged some good Roses; Messrs. Cheal of Crawley hardy fruits, and Mr. Balchin plants. On the whole, the Society, and especially the Hon. Secretary, Mr. Longhurst, must be congratulated on getting together so fine a show.

ROYAL AQUARIUM DAHLIA AND GLADIOLUS SHOW.

SEPTEMBER 6, 7, 8.—The finest exhibition of Dahlias in point of quality held in London for years past was opened on Wednesday, the 6th inst. All the leading growers were represented, and there were six collections of sixty blooms. Mr. C. Turner, Royal Nursery, Slough, was 1st; and Messrs. Keynes & Co., Salisbury, and John Walker, Thame, equal 2d. Messrs. Keynes & Co. were 1st with thirty-six blooms. Messrs. Saltmarsh & Sons 1st with twenty-four blooms, and also with twelve blooms.

In the amateurs' division, Mr. J. T. West, The Gardens, Cornwall, Brentwood, who has been showing very generally in excellent form this season, was 1st with twenty-four blooms. Mr. A. Ocock, Havering, Romford, was 1st with eighteen blooms; and Mr. Thos. Vagg, The Gardens, Bedford, Havering, 1st with twelve blooms, and also with six, all characterised by fine quality.

Pompon Dahlias were very effective in bunches of twenty-four varieties, Messrs. J. Cheal & Sons, Crawley, being 1st; while Messrs. J. Burrell & Co., Cambridge, were 1st with twelve bunches. Mr. J. T. West took the 1st prize for six bunches.

Single Dahlias were very fine also, and Messrs. J. Cheal took 1st honours with twenty-four bunches; Mr. G. Humphries was awarded the 1st prize with twelve; and Mr. R. Burgin, St. Neots, with six. Very fine and striking too were the decorative varieties; Messrs. Keynes & Co. were 1st with twelve bunches, and Mr. J. T. West with six.

A very fine collection of Gladioli from Messrs. J. Burrell & Co., Cambridge, numbering 144 spikes, was awarded the 1st prize, the remarkable fact being that many of the finest spikes were from last year's spawn.

Early Chrysanthemums, though not numerous, were yet very good. The best collection of twenty-four bunches came from Mr. E. F. Such, nurseryman, Maidenhead; Mr. Norman Davis, Camberwell, being a good 2d. A fine stand of twelve bunches of Madame C. Desgranges came from Mr. Shoesmith, Shirley, Croydon; and Mr. J. Agate, Havant, was 1st with twelve blooms of any large-flowered. Mr. D. B. Crane, Highgate, had the best twelve bunches of Pommpons; and Mr. W. E. Pagram, The Whin, Weybridge, the best six bunches of Madame Desgranges and its varieties, and also of any yellow variety of the same. Mr. A. McMillan had the best six blooms of distinct varieties; and Mr. D. B. Crane was 1st, with twelve bunches, not less than three blooms of each. Mrs. Walter Mole, Hemel Hempstead, had the best epergne of Chrysanthemums; Mrs. Smith, Romford, being 2d.

In the miscellaneous class a Silver-gilt Medal was awarded to Mr. A. Rawlings for a large collection of Dahlias; to Messrs. J. Laing & Sons, Forest Hill, for a large collection of cut flowers, and also for 100 dishes of Apples; to Mr. J. B. Payne, gr. to the Lord Bishop of Bath and Wells, for twelve very large fruits of Peasgood's Nonsuch Apple; and a Silver-gilt Medal to Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, for a noble bank of decorative Pompon and single Dahlias. A large number of Certificates of Merit were awarded, to which a later reference will be made.

DUNDEE HORTICULTURAL.

SEPTEMBER 7.—This popular show was opened by ex-provost Moncur, and the Hon. Charles Ramsay addressed a large gathering—so also did Sir John Leng, M.P.—on topics bearing on horticulture in its scientific and practical bearings.

There were three tents full of exhibits, one tent, about 280 feet long, embracing plants, flowers, fruits, and vegetables, of great cultural excellence, and numbering about two thousand entries. In many of the classes competition was very keen, and although cut flowers were not equal in quantity to what have been shown in some previous seasons, there were

many fine exhibits, especially in the nurserymen's and florists' classes, which were numerous, and came from all parts of Scotland.

Plants.—Especially fine were those shown from Rothesay, Aberdeen, and Hawick, and the local nurserymen came forward in great force.

Entering the long tent, a choice collection of Conifers was observed arranged on the grass, and on tables placed round the sides of the tent. Fuchsias did not show their fine drooping habit so well as if they had been a few feet above the ground. The Conifers were nice plants, feathered to the ground, and the green turf covered the roots with fine effect. Cupressus and Retinosporas in variety were the most telling in the collection.

The gardeners' competition tables were near the entrance, and were very creditable well-arranged productions of suitable kinds. Mr. Grossart, gr. to Burock, Dundee, was 1st, with Crotons, of beautiful colour and excellently grown; besides these plants he had Dracænas, Palms, Ferns, and some choice flowering plants (Celosias, in particular), thinly placed in a bed of Adiantum, edged with variegated Panicum and Ficus repens. Mr. Burchart, Elmslee, was 2d, with an effectively-arranged exhibit. The remainder of the tent was filled with groups of such effective plants (standing on the grass) as Liliums, Vallotas, Chrysanthemums, Pelargoniums, Begonias, Coleus, Palms, Ferns, and foliage plants in great variety of forms and shades of colour.

The Tables.—Two showy tables at the further end of the tent formed an attractive finish, and one was at least novel and very interesting, with a choice collection of Pine-apples, Melons, Pears, Apples, Peaches, Plums, &c., and a splendid bunch of Grapes hanging at each corner. Two Gros Maroc were such as one seldom sees for size of bunch and berry, and the colour was as good as possible; the fruits placed round the tall plants, with choice Ferns interspersed, had many admirers. This exhibit was from Mr. George Morrison, Dundee. Messrs. Laird & Sinclair's table was placed to match Mr. Morrison's, and was rich in Palms, Ferns, and florists' flowers. On the long lines of side-tables were exhibited large groups of Gladiolus, Dahlias, Asters, Pansies, Carnations, and Hollyhocks, with mostly every other favourite flower of the season; Cockscombs (about thirty in number) were the finest we have seen at any exhibition for some years, and the 1st prize was won by Mr. Collie, Invertay, with an extra fine triplet.

Cacti and alpine plants, in pots and pans, formed a fine addition to the competitive plants; they were varied in species, and tabled in great numbers, all healthy and vigorous.

Table plants were in great numbers, Mr. Grossart taking the lead. Allamandas, Poinsettias, Yuccas, Dracænas, and Caladiums, of great size, broke up the flatness and monotony of the smaller and lower exhibits. The table on the east side of this tent was loaded with florists' flowers, arranged with fine effect.

Florists' and other Cut Flowers.—Messrs. Thyne & Paton, Croll of Dundee, and Forbes of Hawick, were here in great force. The Carnations, Hollyhocks, and Dahlias, many new ones amongst them, were a fine display in Mr. Forbes' exhibit; Mr. Cuthbertson, of Rothesay, had a magnificent selection of hardy herbaceous plants, worth a visit to the show of itself, and the same exhibitor had a large breadth set apart for exhibiting grand Leeks and red and white Celery, for which they are now so famous. They had quantities of Sugar-Beet, which they are encouraging farmers to cultivate. Messrs. Croll and Cocker, of Rose fame, had a number of boxes of splendid Roses for the season of the year. The colours were very brilliant.

Fruits.—Leaving many fine exhibits unnoticed here, we passed to the fruit tent, where tables were placed all round the sides which were loaded with cut flowers. Honey was an attractive exhibit, and mostly of the finest quality. The fruit appeared to be the most attractive exhibition, as no one could remain near it long without being crushed by the great crowd. The finest collection of eight sorts which won the 1st prize came from Mr. Leslie, gr., Pitcullen, Perth, an exhibitor widely known for his splendid Grapes. He had very fine bunches of Muscat of Alexandria, Madresfield Court, and others, but his hardy fruits were hardly equal to those of some others competing against him. This exhibitor had 1st prizes in other classes where Grapes were prominent exhibits. Messrs. Laing and Dickson were the leaders in the smaller collections of Grapes. Apples were largely represented, culinary fruit was of immense size, and the dessert varieties of beautiful colour.

Stone fruits mostly from open walls were rather small, but of fine colour.

Vegetables made an immense show in a tent set apart for them, the quality being of the highest. Mr. Joss, gr., Craigie, was 1st for the large collection. Cauliflowers, Celery, Leeks, Onions, Peas, and Potatoes were in fine form, but not in great quantity; roots generally were excellent; Parsnips were such as we never saw before, being 4 feet long, and of beautiful form; they were shown by Mr. Duff, gr., Balledgarno. Dundee has deservedly a great name for its horticultural exhibitions, and the Association manages their exhibitions on different lines to other societies, as one may understand when we state that by 7 A.M. the judges were at work, and that they had completed their labours early in the day. Luncheon was served at 1 P.M., where numbers of the county gentry attended, and spoke feelingly on horticultural matters. Lord Dalhousie and Hon. Captain Ramsay acting as vice-chairman; Lord Camperdown was prevented from showing his love to the horticultural interests. *M. Temple, Carron.*

GARDENING AND FORESTRY EXHIBITION.

SEPTEMBER 13, 14.—Another of the fortnightly shows at Earl's Court was opened on Wednesday last, when the exhibits consisted chiefly of Dahlias and fruit. The small tent where the whole of the special exhibitions have been held during this season was much overcrowded, and many of the exhibitors expressed regret that the annex which was in use upon similar occasions last year could not be used now.

Dahlias were very good in quality, and the leading prize for sixty show and fancy blooms was taken by Mr. Charles Turner, the Royal Nurseries, Slough. Messrs. Saltmarsh & Son, the Nurseries, Chelmsford, had the best twenty-four in the nurserymen's class; and Mr. J. T. West, gr. to W. Keith, Esq., Cornwall, Brentwood, the 1st in the amateur section. Mr. J. S. Fowler, Giebelands, South Woodford, had the best twelve blooms among amateurs.

For a collection (any types) arranged for effect in a space of 12 feet by 6 feet, Messrs. J. Cheal & Sons, Lowfield Nurseries, Crawley, Sussex, were 1st; and Messrs. Keynes, Williams, & Co., Salisbury, 2nd. Messrs. Keynes, Williams & Co. were 1st for eighteen Cactus or decorative Dahlias in bunches of six; and in the amateurs' class for nine bunches, the 1st place was taken by Mr. E. Brown, gr. to M. W. Morris, Esq., Oak Lodge, Horley, Surrey.

Mr. Charles Turner had the best twenty-four Pompons in the nurserymen's class, and Mr. J. T. West, gr. to W. Keith, Esq., Cornwall, Brentwood, had the best twelve from amateurs. T. W. Girdlestone, Esq., Sunningdale, Berks, was 1st for twelve single varietal.

For a collection of twelve Sunflowers, Messrs. J. Burrell & Co., Home House Nurseries; and Messrs. Paul & Son, Old Nurseries, Cheshunt, were 1st for a collection of cut blooms of Michaelmas Daisies.

Fruit.—There was not a very great deal of fruit, but the quality of some of the dishes left nothing to be desired.

Mr. Geo. Woodward, gr. to Roger Lee, Esq., Barham Court, Maidstone, took leading honours in the classes for three dishes of Peaches, for dessert and culinary Apples, and for three dishes of Pears. The Apples and Pears shown by Mr. Woodward were quite remarkable for their quality.

Mr. J. Sanders, The Gardens, Poulton Ramsey, Hampshire, had the best single dish of Peaches.

Mr. J. McIndoe, Hutton Hall Gardens, Guisborough, Yorks, had the best three dishes of Plums in the class for dessert fruit; and in the one for cooking Plums, Mr. McIndoe had also the best collection of cooking and market Plums, showing twenty-five dishes; and Mr. R. Potter, gr. to Sir Mark Collett, St. Clere, Kemsing, Sevenoaks, was 2nd.

Miscellaneous.—Included among the groups and collections of non-competitive exhibits were a very grand group of Begonias, by Messrs. John Laing & Son, Forest Hill, which occupied one of the ends of the tent. A collection of Dahlias by Mr. M. V. Seale, Vine Nurseries, Sevenoaks; a large group of Dahlias at the other end of the tent from Mr. T. Ware, Tottenham; a few Dahlias from Mr. J. R. Trauter, Hangley-on-Thames. Another collection from Mr. J. Walker, Thame, Oxon; a group of Canna sprays by Messrs. Cannell and Sons, Swanley. Also some trusses of Begonia blooms; and some specimens of the Simplex Syringe

Fumigator by Mr. A. W. Young, 137, Homesdale Road, South Norwood, S.E. Mr. E. F. Such, Maidenhead, had a group of Dahlias; Mr. T. A. Hester, gr. to W. G. Dawson, Esq., The Links, Plumstead Common, had a collection of Apples; and fruits were also shown by Mr. J. T. Hoar, gr. to T. J. Cooper, Esq., The Grange, West Moulsey; Messrs. Paul & Son, Cheshunt; Messrs. S. Spooner & Sons, Hounslow Nurseries, Middlesex; Mr. W. Poupart, Twickenham; and Mr. A. H. Richwood, gr. to the Dowager Lady Freake, Fulwell Park, Twickenham.

DALE, GLASGOW, AND WEST OF SCOTLAND HORTICULTURAL.

The exhibition of the above, which was held in St. Andrew's Hall, Glasgow, was admitted on all hands to be the finest yet held in Glasgow. A large hall was filled with tables of choice plants for exhibition and competition. A score of tables were furnished with flowering and foliage plants—Crotons, Liliums, Pancratiums, and Fuchsias, well interspersed with Ferns, predominated. Messrs. Thyne's table was conspicuous for its great height and the gracefulness of the arrangement, many drooping plants being employed; it was greatly admired.

Messrs. Austin & McAslan had also a grand table, which attracted many admirers; but the Medal of the *Gardeners' Magazine* was awarded to Mr. McGinley, Oakleigh Park, gardener, for his beautifully-arranged table of plants, as being the most meritorious exhibit in the Hall; but Mr. McBean would have undoubtedly received this award for his 1st prize collection of vegetables, but being a recipient so often, he remains an ex-champion. The specimen Crotons, Ferns, and Palms, were distributed throughout the halls with excellent effect. The long tables of cut flowers—Dahlias, Carnations, Phloxes, Asters, and herbaceous plants—were an immense show of themselves. Messrs. Dobbie of Rothesay, Forbes of Hawick, and Campbell of Blantyre, had great exhibits of mostly every choice outdoor flower of the season. Pansies were in great force, many of them quite new in character; so were Dahlias, especially in the classes of Cactus and single varieties. Messrs. Campbell and Forbes had Hollyhocks in great variety, and quite free from disease. Passing round the platform, immense Palms, Ferns, and Lycopods as a ground-work, formed a handsome screen to the musicians in front of these fine plants; and at a lower level was a screen to the tubs and pots by a line of Vines in pots loaded with fruit. Passing onward, large banks of Gladioli filled the whole end of one of the lesser halls. The dinner-table decorations were capitally represented, Mr. McNeil, Shawlands, being an easy 1st. Mirrors, on which tracings of Lycopods and handsome leaves were carelessly laid, had a charming effect. Vases, from which grasses, mosses, and graceful foliage hung, was very tasteful. The fruit was of fine quality (not often a prominent feature among such decorations), and the other accompaniments were also of the best possible. Messrs. Smith & Son, Glasgow, were 2nd with a choice display. We pass many extra good Roses for the season. The largest exhibitors of these were Messrs. Cocker of Aberdeen, and Robinson of Helensborough Nurseries.

The Fruit.—There was the largest display of fruit that has ever been witnessed in Glasgow, and some grand bunches of Muscat of Alexandria were tabled. The 1st prize for two bunches went to Mr. Day, Galloway House, out of twelve exhibits. In the class for four bunches of Grapes, Mr. Leslie, Perth, had excellent Muscats, Gros Maroc, Black Alicante, and Madresfield Court; Mr. Day was a capital 2nd, the competition being very strong. For Black Hamburgh Grapes, 1st, Mr. Meuzies, Dunipace Gardens, with finely finished bunches; but many of the other exhibits in this class were but poor. In the collections of fruit, Mr. Murray, gr., Culzean Castle, was well to the front, his Muscat Grapes, Queen Pine, Pears and Apples were very good; 2nd, Mr. Bean. In the collection of six sorts, Mr. Halliday, Ayr, was 1st, his Muscat Grapes were superb; Mr. McConochie was a good 2nd.

For a collection of hardy fruit, 1st, Mr. Day, with an excellent assortment, the Figs, Apples, and Pears being of great merit. This class was largely represented, and all was good; Melons were beautiful, but the worst in quality we ever tasted at any show. Some shabby-looking fruit, with scarcely any perfume, were placed 1st, 2nd, and 3rd. The three bunches of Grapes set up by Messrs. Cross (exhibited along

with collections of flowers and plants) were large, handsome, and finely coloured, and said to be grown with the aid of their special manure. The Apples and Pears in their various classes were never excelled, and showed what a warm summer can do in maturing and beautifying hardy fruits; and they are nearly a month earlier than usual. Some large bunches of Grapes for heaviest were shown. A bunch of Gros Guillaume weighed 11 lb., and was finely finished; a fine Muscat was also noticed in this competition.

Vegetables.—One of the finest displays ever seen in Scotland filled a large division of one of the halls. The collection of Mr. Bean was as near perfection (so said experts) as could be desired. His Leeks, Cauliflowers, Peas, Onions being of great excellence. Mr. Lowe, of Stirling, was a good 2nd. We counted more than twenty collections, and each was of first-rate quality. In the Leeks classes, which were many, Mr. McBean surpassed himself, as he did with Onions, Roots, Kales, and the endless pots of Parsley were strong in competition—1200 entries were booked for this grand exhibition. *M. T.*

ROYAL CALEDONIAN.

SEPTEMBER 13.—The friends of this prosperous society may congratulate themselves on the great success of their autumnal exhibition. The fine weather, large attendance, and two thousand exhibits on Wednesday last, surpassed any of the ordinary shows which have taken place under the management of the "Zealous Veterans," whose enthusiasm (on these great occasions) is so manifest that they are not slow to give expression to their delight.

The exhibits in the plant classes were above par. The cut flowers (some from far north and south of Scotland), were of great excellence, and did not indicate any injury from the season being so early, dry, and warm.

The fruit, in many classes, was finer than ever seen in Edinburgh, and the exhibits were more numerous than at any exhibition held by the society. Though some of the Grape classes were represented strongly in quantity and quality, there were some classes decidedly under the average.

The tables for "exhibition only," were finer than usual, and more numerous. Entering at the east side, a long table of large specimen Ferns blocked the way somewhat, but they were most creditable specimens.

Davallia, *Pteris serrulata*, *P. major*, *P. cristata*, and *Adiantum* were of immense size, and in fine health.

Dickson & Co., as usual, showed extensively. Pansies, Apples, and Pears (hundreds of dishes), and Plums made an attractive display. Specimen plants occupied the centre of their large table. Fuchsias from Mr. A. Thomson and Mr. Anderson were much finer than usual.

Mr. Methven's table of Begonias was a great attraction, the varieties distinct and of much merit. In addition to this, they had a long table of choice decorative plants, Caladiums and Crotons of rich colour, Dracenas, and flowering plants tastefully interspersed. Messrs. Birkenhead had a table about 65 feet long filled with collections of Ferns. We here come to the gardeners' tables for competition, Mr. McIntyre, Darlington, being 1st with a table tastefully arranged. Mr. Wood, gr., Oswald Road, was a good 2nd. Cunningham & Fraser were well represented by collections of Hollies. Messrs. James Dickson & Sons and Messrs. Laird were strong in specimen Hollies and Conifers, which had a fine effect at the west end of the hall. Mr. Phillips, Granton Road, had a fine display of *Arancaria excelsa*, arranged for effect. Mr. John Downie had one of the most telling tables arranged for effect, with choice stove and greenhouse plants; and a second one of flowering plants. Passing long tables of zonal Pelargoniums and cut flowers, we arrive at the specimen Crotons for competition. The huge pair from Mr. Lunt, Keir House Gardens, surpassed any seen at Edinburgh for many years; and Mr. McIntyre, Darlington, was 2nd out of eight exhibits. We now come to the table of Mr. Campbell, nurseryman, Blantyre, laden with cut Carnations, Picotees, Dahlias, Pansies, &c., who has taken 1st prize for Dahlias and Picotees at all the shows where he has exhibited this year.

Mr. Forbes, Hawick, as usual, had a large and varied group, chiefly herbaceous plants and hardy florist flowers. Mr. Lister, Rothesay, had an immense display of cut flowers; so had Messrs. Laird, Edinburgh, Mr. M. Cuthbertson, Rothesay. Mr. Dobbie from the same place exhibited cut flowers in excellent form. Mr. Cocker, Aberdeen, made a great display of cut

flowers—of great merit but too numerous to particularise. We now reach the most attractive table in the show laden with bouquets and Orchids. Mr. Curror, Eskbank, was 1st for four Orchids, *Oncidium incurvum* was an immense plant (about 7 feet across), with grand spikes of inflorescence; *Vanda cœrulea*, *Miltonia spectabilis*, and *Celogyne Massangeana* were all good. Mr. Wilson, Kelvinside, was 2nd, *Odontoglossum grande* and *O. crispum* were in fine form.

For *Odontoglossums*, *Cypripediums*, and *Cattleyas*, Mr. Sharpe was 1st in each class; a great table of very fine *Cockscombs* was a change, and were very attractive.

Fruit.—Passing a wealth of cut *Gladioli* and other brilliant flowers, we now reach the fruit classes. The collections of twelve dishes were as fine as we have seen in the North. Mr. Hunter, gr., Lambton Castle, took the lead, and his *Grapes*, *Pears*, *Apples*, *Peaches* *Exquisite* and *Noble*, and *Nectarines*, were of the highest merit. Mr. Kirk, Alloa, though less strong in hardy fruit than Mr. Hunter, was much stronger in *Grapes*; Mr. McKelvie was an excellent 3rd, *Muscats* of *Alexandria* *Grapes* in this collection being the finest in the exhibition.

In the collection of eight sorts, Mr. Hunter again led with a similar 1st, Mr. McKelvie making a capital 2nd.

In the class for twelve bunches of *Grapes*, Mr. Kurke was deservedly 1st, with as fine *Grapes* as we ever saw (surpassing his collection at the International Exhibition two years ago). Duke of Buccleuch, Gros Maroc, Madresfield Court, and Black Hamburg, were the varieties; Mr. Leslie, Perth, came in a good 2nd.

In the class for four bunches, Mr. Leslie came well to the front; his *Muscats* and *Black Alicantes* were of great merit. Mr. Caldwell, Lougholm, was 2nd. *Black Hamburgs* we pass over, the average quality being but poor in this class, seldom well represented either in north or south. *Alicantes* and *Madresfield Court* were not equal to the average at Edinburgh in the single exhibits. *Muscats* were very fair, but Mr. McKelvie's pair out-distanced all others. *Lady Downe's* were only medium, being rather small in the berry. For the finest-flavoured *Black*, the exhibits were quite below average, and were chiefly *Black Muscats*. For the best *White*, for flavour, a *Muscats* of *Alexandria* was placed 1st, but it was not first-rate in flavour. Duke of Buccleuch led for any other white, Mr. Caldwell being 1st. Mr. McLutye, The Glen, was 1st for bloom, with *Alwick Seedling*.

In a collection of hardy fruits, Mr. Goodfellow, Kinfauns Castle, Perthshire, was 1st, with really good fruit. His *Peaches*, Dr. Hogg and Prince of Wales, were very fine in size and colour. *Plums*, *Apples*, and *Pears*, were also good.

For orchard-house fruits, Mr. Hunter, Lambton, out-distanced all his competitors with a grand exhibit.

Plums were finer in quality, and more numerous than we ever saw them at Edinburgh. *Peaches* were fine in several of the classes, but those from Mr. Lunt, Keir Gardens, were among the finest ever seen at Edinburgh, averaging over 10 oz. each in the dozen tabled; *Late Admirable* was the sort. Mr. Rigg, gr. at Tarvet, was 1st for *Nectarines*, having a first-rate dozen made up of *Victoria* and *Pine-apple*. The exhibition of *Apples* was equal to the best we ever saw anywhere in south of England, the size and colour being of highest merit, and hundreds of dishes were tabled in the various classes. Mr. Campbell, from Swansea, South Wales, had grand examples and was 1st in the best collections. Mr. Brown, Abercainey Gardens, had some beautifully-coloured fruit gathered from stone walls. *Pears* too were of great excellence, and hundreds of dishes were tabled.

Vegetables were a grand exhibition of themselves, every class being strongly represented; in that for twelve varieties there were twelve very good exhibits, Mr. Harper taking the lead. *Onions*, *Celery*, roots of all kinds, *Tomatoes*, and *Cauliflowers* were among the best we ever saw. The last-named was represented in twenty exhibits for six, and all first-rate. This was the finest autumn show ever held in Edinburgh by the Caledonian Horticultural Society.

Obituary.

JEAN BAPTISTE GUILLOT.—This morning's post brings me the sad intelligence of the death, on September 6, of Monsieur Jean Baptiste Guillot, of

Lyons, rosierists and Chevalier du Merite Agricole, at the age of sixty-six years. I had known him from a very young man, and have had many pleasant and profitable conversations with him on *Roses* and *Rose* culture. He was, in my judgment, all things considered, the most successful of the modern French *Rose* growers. Every year he had something new and beautiful to show to those who visited his *Rose* garden in the *Chemin des Pins*, at Lyons. Of the many valuable varieties which he introduced I may mention:—*Catherine Mermet*, *Madams de Watteville*, *Madame Hoste*, *Madame Falcot*, *Madams Cusin*, *Edith Gifford*, *Christine de Nœ*, *Ernest Metz*, *Gloire Lyonnaise*, *La France*, *Etoile de Lyon*, *Comtesse de Nadaillac*, *Honore Vernet*, *Gloire des Polyanthas*, *Mlle. Eugénie Verdier*; but the number is legion, and the quality of his seedlings in the bulk was usually above the average. He was much respected by his colleagues and by a large circle of amateur friends. The late Monsieur Jean Sisley once said to me:—"Guillot is a very honest man," and in saying that he meant to convey the highest possible praise. M. J. B. Guillot's father was a *Rose* grower of celebrity at Lyons some fifty years ago, and raised many good *Roses*, among others the *Rose Géant des Batailles*, which created quite a sensation in the gardening world at the time of its introduction (1846); the *La France* of the son twenty years later was hardly a greater triumph. *Wm. Paul, Waltham Cross.*

BOOK NOTICE.

A BIOGRAPHICAL INDEX OF BRITISH AND IRISH BOTANISTS. Compiled by James Britten, F.L.S., Senior Assistant, Department of Botany, British Museum; and G. S. Boulger, F.L.S., Professor of Botany, City of London College. (West, Newman & Co., 54, Hatton Garden.) 8vo, pp. 188.

We have had frequent occasion to allude to this list during its publication in the current volumes of the *Journal of Botany*, and have made numerous extracts from it in these columns. Many of our readers will, we are sure, be glad to learn that so useful a list has been reprinted in separate form, so as to be easily referred to. Moreover, considerable additions have been made, so that now the list includes the names of more or less prominent botanists from the earliest records to the end of 1892, and contains, we are told, 1825 entries. Considering the number of centuries over which the record extends, this seems an insignificant number. And yet there is no reason to complain of the authors on the score of undue reticence. They have, as they say, been liberal in including the names of those "who have in any way contributed to the literature of botany, who have made scientific collections of plants, or have otherwise assisted directly in the progress of botany exclusive of pure horticulture." The horticulturist, jealous for the honour of his craft, or anxious to obtain information as to the history of its heroes, need not fear that the compilers of this index have neglected his interests. So far as we have seen, there are included in this volume brief notices concerning most of the great horticulturists, such as Darwin, Hales, Herbert, Knight, Hooker, Lindley, Loudon, Wilson Saunders, Harpur-Crewe. Again, most of the great botanical collectors are mentioned, such as Masson, Douglas, Fortune, John Gould Veitch, and of course all or the great majority of those who have sent home collections of dried plants. The line seems to have been so drawn as to exclude only those collectors whose objects were wholly of a commercial character. Against this exclusion we have no right to complain; a compiler must lay down rules for himself, and the less he is tempted to diverge from them, the better will his book be. Nevertheless, it is clear that a strict adherence to such a rule may sometimes be the means of excluding historical data of great importance from a purely botanical point of view. Although not strictly to the point,

as the persons concerned are still living, and therefore on that ground would be properly excluded from such a list, let us take as a general illustration such a case as that of the discovery of *Eulophiella*, a new genus of *Orchids* from Madagascar. We are not expressing any opinion on what is a matter of controversy, but we take it as an illustration of great importance from a botanical point of view. This discovery has been utilised solely for mercenary purposes. Worse still, the discoverer, or one of the discoverers, actually announces, as if it were as great a credit to him as (if it be true) it is a disgrace, that he has destroyed all the plants within range, in order to enhance the commercial value of those which he collected! On moral grounds, such a man should certainly find no place in a scientific record, and yet from an historical standpoint he, as the discoverer and introducer of a new genus, may merit recognition. Fortunately for Messrs. Britten and Boulger, they were not called on to act in this case, which is one altogether beyond their limitations. We allude to it to show the great difficulty there is in laying down any rule as to the inclusion or rejection of names in such a book as the one now before us. A discovery made and turned to account solely for commercial purposes in the first instance may be, and, as we have just shown, is, sometimes, a matter of very great botanical importance.

The details given by the authors are very concise but considering that they comprise reference to other sources of information, they are adequate. The acquirements of the authors, and the unrivalled facilities at their disposition in the Museum, offer the best of guarantees that their work has been well done.

A few points may be noted for consideration, if a supplement or a new edition be called for. Patrick Browne, a writer on Irish and on West Indian plants, is described as Curator of the Oxford Botanic Garden. We are not wholly unfamiliar with the history of the Oxford garden, but we do not remember to have heard of this botanist having held the position assigned to him. The name of Theodore Hartweg certainly should have been included as having made large scientific collections of plants; and considering the physiological work of Thomas Rivers, the omission of his name is to be regretted. The name of the Rev. H. Harpur-Crewe is indexed under Harpur, but not under Crewe, where we should have expected to find it, and Thomas Lobb is, we believe, still living.

In consulting the book during its progress in detached parts and now as a whole, as we have done very frequently for some time past, we have found much to admire. We have in the great majority of cases found all that we could reasonably expect to find, and it has very seldom indeed happened that we have been disappointed in our quest. Those interested in the history of horticulture, as well as in that of botany, will find the work indispensable.

NEW INVENTION

THE EASY WEED-DESTROYER.

The Standard Manufacturing Company of Derby submit for our examination one of these appliances. It consists of a metal receptacle, which communicates by means of an elastic tube with a long copper tube, provided with a small aperture at the bottom, and affixed to an ash staff which terminates in a spike. The metal cup, having been filled with weed-killer, the spike is thrust into the crown of the weed, the metal cup is then raised, an operation which ensures the passage of a drop or two of the weed-killer down the copper-tube, and through the hole at its end close to the spike, into the heart of the plant whose destruction is thus compassed. The invention is easy to work, ingenious and effective, and is specially suitable to amateurs and lady-gardeners, as no stooping is necessary.

MARKETS.

COVENT GARDEN, September 14.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day, Ed.]

PRICES rule as last week.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

s. d. s. d.	s. d. s. d.
Adiantum, per doz. 6 0-12 0	Foliage plants, doz. 12 0-42 0
Aster, dozen buds. 15 0-39 0	Fuchsia, per doz. ... 4 0-6 0

POTATOS.

The demand is not equal to the supplies, which are very heavy, except for best samples which are readily picked up at good prices, 80s. to 90s.; ordinary stuff, 40s. to 50s.; and even at these prices slow trade. J. B. Thomas.

SEEDS.

LONDON: Sept. 13.—Messrs. John Shaw & Sons, Seed Merchants, of Great Mills Pond, Borough, London, S.E., write that the present remarkable and protracted drought naturally restricts the consumptive demand for seeds required for immediate sowing. Trifolium incarnatum is easier, and can now be bought in London on very moderate terms. Of Winter Tares the supply is getting short, and values tend upwards. Giant seed Rye offers at very tempting rates; French Italian continues scarce and dear. Rape seed is good and cheap. White Mustard steady. Linseed quiet. Not much doing in Peas and Haricots. Canary seed is slowly hardening.

FRUITS AND VEGETABLES.

BOROUGH: September 13.—Quotations:—Cabbages, 5s. to 6s. per tally; Turnips, 4s. to 5s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. 6d. to 5s. 6d. per bag; Damsons, 1s. 6d. to 2s.; Plums, 1s. 8d. to 2s. 6d. per half-sieve; Apples, 2s. to 3s.; Pears, 2s. 6d. to 3s. per bushel.

SPITALFIELDS: September 13.—Quotations:—Cabbages, 5s. to 6s. per tally; Turnips, 4s. to 5s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. 6d. to 5s. 6d. per bag; Apples, 2s. to 3s.; Pears, 2s. 6d. to 3s. per bushel; Damsons, 1s. 6d. to 2s.; Plums, 1s. 6d. to 2s. 6d. per half-sieve.

STRATFORD: Sept. 13.—There has been an excellent supply of all kinds of produce at this market during the past week, and a brisk trade has been done at the undermentioned quotations:—Cabbages, 3s. to 6s. per tally; Cauliflowers, 1s. to

1s. 9d. per dozen; do., 5s. to 6s. 6d. per tally; Turnips, 2s. to 3s. 6d. per dozen bunches; Carrots, household, 60s. to 70s. per ton; Mangels, 20s. to 24s. do.; Onions, Dutch, 4s. 9d. to 5s. per bag; Apples, English, 1s. 6d. to 4s. per bushel; Plums, 2s. to 2s. 9d. per half-sieve.

FARRINGTON: September 13.—Quotations:—Onions, 4s. 6d. to 5s. 6d. per bag; Cabbages, 5s. to 6s. per tally; Turnips, 4s. to 5s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Marrows, 1s. 6d. per dozen; Cucumbers, 2s. to 2s. 6d. do.; Beans, 1s. 9d. to 2s. per half-sieve.

FARRINGTON: September 14.—Quotations:—Apples, 2s. to 2s. 6d. per bushel; Pears, 6s. do.; Plums, 2s. 6d. per half sieve; Damsons, 2s. do.; Tomatoes, French, 3d. per lb.; Walnuts, 9s. to 11s. (50 kilo.); Cucumber, large frame, 1s. 9d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: September 13.—Prices range from 50s. to 105s. per ton.

STRATFORD: September 13.—Quotations:—Light-land, 50s. to 65s.; Dark-land, 40s. to 50s.; Hebrons, 70s. to 80s.; Imperators, 50s. to 75s. per ton.

FARRINGTON: September 14.—Quotations:—Reading Giants, 55s. to 60s.; Hebrons, white, 80s. to 90s.; Bruce's, 55s. to 65s.; Sutton's Abundance, 70s. to 80s. per ton.

LONDON AVERAGES: September 13.—Magnus, 50s. to 60s.; Hebrons, 80s. to 110s.; Snowdrops, 80s. to 100s.; Regents, 70s. to 80s.; Champions, 60s. to 70s. per ton.

CORN.

Averages.—Official statement of the average prices of British corn, imperial measure (quarter) for the week ending September 9, and for the corresponding period last year:—1893: Wheat, 25s. 7d.; Barley, 27s. 2d.; Oats, 17s. 4d. 1892: Wheat, 29s. 5d.; Barley, 27s. 8d.; Oats, 20s. 2d.

HAY.

Averages.—The following are the averages of prices at the principal metropolitan markets during the past week:—Clover, prime, 115s. to 165s.; new, do. 125s. to 155s.; inferior, do. 100s. to 120s.; hay, best, 145s. to 170s.; inferior, do., 90s. to 100s.; new mixture, 115s. to 130s.; and straw, 35s. to 54s. per load.

[By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

- 0, Scotland, N.; Principal Wheat-producing Districts—1, Scotland, E.; 2, England, N.E.; 3, England, E.; 4, Midland Counties; 5, England, including London, S.; Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.; 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending September 9, is furnished from the Meteorological Office:—

"The weather was very fine and dry during the earlier part of the week, but subsequently it became rather unsettled, with occasional rain. Thunderstorms were experienced in most parts of Great Britain on Friday, the accompanying rainfall being heavy in some districts.

"The temperature was above the mean, the excess ranging from 1° in 'Scotland, W.,' to 3° in 'England, N.E.,' the 'Midland Counties,' and 'England, S.W.,' and to 4° in the 'Channel Islands.' The highest of the maxima, which were recorded either on the 3rd or 4th in Ireland, on the 5th in Scotland, and on the 6th in most parts of England, varied from 81° in 'England, S.,' and 80° in 'England, E.,' to 72° in 'Ireland, S.,' and to 71° in 'Scotland, N.' The lowest of the minima were registered, as a rule, either at the beginning or end of the week, and ranged from 35° in 'Scotland, E.,' and 36° in the 'Midland Counties,' to 43° in 'England, N.W. and S.W.,' and to 54° in the 'Channel Islands.' At some of the inland stations ground frost was experienced.

"The rainfall slightly exceeded the mean in the 'Channel Islands,' and just equalled it in 'Scotland, N.,' but in all other districts there was again a deficit.

"The bright sunshine was very prevalent, and exceeded the mean in all parts of the Kingdom. The percentage of the possible duration ranged from 73 in the 'Channel Islands,' to 60 in 'England, S.W.,' and to between 41 and 53 in most other districts. In 'Scotland, N.,' and 'Ireland, N.,' however, the percentage only reached 30."

A STACK OF LOAM SWARMING WITH WOODLICE: C. B. W. They may be driven out of the stack by saturating it with strong manure-water once or twice; or, by taking the stack down and re-erecting it in alternate layers of steamy rack stable dung. This would improve the loam, the ammonia would drive out the insects, and the whole fitted for use in six months from the time of performing the job.

ADDRESS OF BOOKSELLER: G. Bligh, Chandos Street, W.C.

ANTIRRHINUM: J. M. R. Interesting as malformations, but of no use as florist's flowers. The corollas are split up into their constituent petals, or rather the five petals have not become united as they usually do in the course of growth.

BOOKS: N. S. No one book will afford you the information required, and you should obtain the following, *How to Lay-out a Garden*, by the late E. Kemp. It was printed and published by Bradbury & Evans, 11, Boulevard Street, E.C.; *The Art and Practice of Landscape Gardening*, by H. E. Milner, of the author, Dulwich Road, Norwood, S.E.; and Simpkin Marshall, Hamilton, Kent & Co., Stationers' Hall Court, London; *Landscape Gardening*, by Samuel Parsons, G. P. Putnam's Sons, 27, King William Street, Strand, W.C. London's *Suburban Gardener* is a bit old-fashioned in its plans and other matters, but it advocates excellent methods of practice in general, and gives abundant reasons for everything. This and the first-named may be obtained from some of the best old book-shops. If pinned to one book, choose Kemp's.—*Kolland*. The book which we suppose you to mean is Chas. Whitehead's (not Muirhead), entitled *Hints on Vegetable and Fruit Farming*, 4th ed., London, John Murray, Albemarle Street, Piccadilly, price 1s. 6d. The other manuals on *Gooseberries and Currants*, *The Pear*, *The Apple*, all by Mr. D. T. Fish, are obtainable at the *Bazaar Office*, 170, Strand, W.C., some at 1s. others at 1s. 6d. each. An "authoritative" list of *British Apples* was published by the Royal Horticultural Society in 1884. It is a report of the committee of the National Apple Congress, held at Royal Horticultural Society Gardens, October 5 to 25, 1883. London: Macmillan & Co.—A. H. B. The Cape Colony has a warm temperate climate; and you would find *The Vegetable Garden*, by MM. Vilmorin-Andrieux, of Paris, a suitable book. There is an English edition published by John Murray, Albemarle Street, London.

CHRYSANTHEMUM BUDS DESTROYED: *R. O.* This is pretty certainly due to some nocturnal earwig, weevil, or larva. The injury does not appear very recent; but if you will go in and visit the plants at night, and tap them sharply over a sheet of paper, if you find anything send it up to this office.

CHAD: *J. A. K.* *Pyrus baccata* varieties.

FUNGUS ON CABBAGE: *T. H. S.* *Cystopus candidus*. Try the Bordeaux mixture, or dusting with sulphur. Bad cases should be destroyed by fire.

FIGS WITHERING AT THE STALK: *C. W. R.* Due to some error of treatment.

GARDENIA ROOTS: *F. F.* We are unable to find any insect on your cuttings. We have seen similar appearances produced by slime-fungi. Obtain some fresh plants from outside, and grow them under the same conditions, so as to see whether the fault is in your soil.

GENUS AND VARIETY: *J. H.* A genus is such a group of different kinds as *Rosa* or *Brassica*; a variety is such a particular form of, say, *Brassica* as *Kale*, or *Savoy*, or *Cauliflower*.

KID-GLOVE: *Anxious One.* The larva are probably those of a beetle of the genus *Dermestes*, which would find kids nice tender eating. The question is hardly horticultural, unless it be that your garden-gloves are attacked. *L.*

MUSCAT GRAPES: *E. K.* The shrivelling complained of may be due to several causes, as, for instance, lack of moisture in the soil, and immaturity at the time of cutting the bunches; or it may be the forerunner of "shanking," which is due to a variety of causes. Kindly send fruit, shoots, and foliage for examination.

NAMES OF FRUITS: *W. J. B.* Your Pear was much bruised and over-ripe; it is *Williams' Bon Chrétien* or *Souvenir du Congrès*, we cannot be sure which variety.—*G. Southcott.* Apple *Cellini Pippin*.—*J. W.* *Flemish Beauty*, a very fine specimen.—*C. H. H.* 1, *Beurré d'Amanlis* (west wall), other not recognised; 2, *Beurré Hardy*; 3, *Madame Treve*; 4, *Bergamotte d'Espere*; 5, *Jersey Gratioli* Apple, true *Galloway Pippin*.—*Kent & Brydon.* Apple, most probably *Lord Derby*.—*George Waitt.* Apples: 1, *Stone's*; 2, *Golden Noble*. Pears: 4, *Durandean*; 5, *Williams' Bon Chrétien*.—*B. R. D.* 1, *Glon Morceau*; 2, *Van Mons Léon Le Clerc*; 3, *Beurré Bachelier*.—*Pom. Apple, Blenheim Orange.*—*H. D. H.* Pear *Beurré Clairgeau*.—*An Old Subscriber.* 1, *Cox's Pomona*; 2, *Emperor Alexander*; 4, *Beauty of Kent*; 5, *Grange's Pearmain*; 6, not known.—*G. P.* 1, *Beurré Hardy*; 3, *Pomme de Neige*; 4, *Flower of Kent*; 5, *Tower of Glamis*; 6, *Warner's King*; 7, *Cox's Orange Pippin*.—*A. C.* *Yarm.* 1, *Manx Codlin*; 2, not known; 3, *Bishop's Thumb*; 4, *Clapp's Favourite*; *Plum, Lawson's Golden*.—*J. P.* 1, *Lord Suffield*; 2, *Non-such*; 3, *French Crab*; 4, *Maltster*; 5, *Barchard's Seedling*; 6, *Alfriston*.—*George Woolgar.* 1, *Col. Vaughan*; 2, *Kerry Pippin*.—*Alpha.* Your Piums were quite decayed.—*M. B.* *Chislehurst.* Pear *Beurré d'Amanlis*; 1, *Stone's*; 3, *Duke of Devonshire*; 4, *Old Nonpareil*; 5, *Golden Spire*.—*J. S.* *Knole.* 1, *Souvenir du Congrès*; 2, *Beurré d'Amanlis*; 3, *Comte de Lamy*; 4, *Soldat d'Espere*; 5, *Beurré Bosc*.—*Chas. Young.* 1, *Vicar of Winkfield*; 2, *Althorp Crasane*; 3, *Glon Morceau*; 4, *General Todleben*; 5, *Louise Bonne of Jersey*; 6, *Passe Colmar*; 7, *Winter Doyenné*; 9, *Vicar of Winkfield*; 11, *Marie Louise*; 15, *Beurré Clairgeau*.

NAMES OF PLANTS: *A. B. B.* 1, a *Solidago*, we do not know which one; 2, *Achillea Ptarmica*, double flower; 3, *Achillea Ptarmica*, single; 4, *Staphylea pinnata*; 5, *Erigeron canadensis*.—*Ancient.* *Helianthus decapetalus*, *Malope grandiflora* (*Malvaceæ*).—*D. J.* *Broussonetia papyrifera*.—*J. J. S.* 1, *Arundo Phragmites*; 2, *Alopecurus agrestis*; 3, *Melica uniflora*; 4, not recognised, perhaps an *Agrostis*; 5, *Agrostis vulgaris*; 6, *Agrostis alba*; 7, *Aira flexuosa*; 8, *Milium effusum*; 9, *Bromus giganteus*.—*J. R.* The one with the leaves much tapered at the base and yellowish fruit is *Cratægus punctata*; the other is one of the many forms of *C. coccinea*.—*Reader.* *Cratægus punctata*, red fruits. *Pyrus Aria*.—*W. C. & Sons.* One of the many forms of *Phillyrea latifolia*; your specimens show how variable the plant is.—*Viridis.* *Cratægus punctata*.—*R. B.* *Chislehurst.* *Lobelia speciosa*, one of the varieties of *L. erinus*, of which there are many.—*C. W.* 1, *Nephradium molle*; 2, *Pteris tremula*; 3, *Adiantum tenerum*; 4, *Poly-podium phymatodes*; 5, *Aspidium Sieboldii*; 6,

Lastrea aristata variegata; 7, *Asplenium cicutarium*; 8, *Adiantum macrophyllum*.—*Firgrove.* 1, *Asplenium Ruta-muraria*; 2, *A. Trichomanes*; 3, *Ceterach officinarum*.—*Ovon.* *Ampelopsis Veitchii*; Pears later on.—*W. T.* *Lycopodium clavatum*; getting scarce in the south.—*H. F.* 1, *Abies pectinata*; 2, *A. Nordmanniana*.—*S. M.* *Banbury.* 1, *Adiantum formosum*; 2, *Pteris adiantoides*; 3, *Aspidium* (*Cyrtium caryotideum*); 4, *Adiantum hispidulum*; 5, send in flower; 6, *Galega officinalis alba*.—*T. Wakeford.* 1, *Lygodium scandens*; 2, *Carex variegata*; 3, *Aspidium* (*Cyrtium*) *falcatum*; 4, *Adiantum hispidulum*; 5, *Pteris argyrea*; 6, *Gymnogramma ochracea*.—*A. D.* *Ledum latifolium*.—*W. B.* 1, *Solidago canadensis*; 2, *Achillea Ptarmica*; 3, *A. P. fl.*; 4, *Aster* not recognised; 5, *Pelargonium* next week; 6, *Lonicera japonica*.

SEEDLING APPLES: *W. H. Manning.* A promising enough fruit, quite distinct in our opinion.

SENECIO, FUNGUS ON: *T. S. W., G. P., and others.* The Orange fungus is, we believe, *Coleosporium senecionis*. In another form or stage of growth it grows on Scotch Pines and other Conifers, when it has quite a different appearance.

SHRUBS FOR GROWING IN THE SHADE OF TREES: *W. T. H.* *Yew, Cornus Mas, Cornus alba, Ruscus aculeatus*; *Cotoneaster microphylla*, if shade be not too dense; *Berberis (Mahonia) aquifolia*, *B. Darwinii*, *B. vulgaris*, fairly well; common *Hazel*, *Blackthorn, Burus*. *Rhododendrons* are partial to shade, and usually flower well. *Skimmia japonica* (oblate of gardens), common *Laurel, Laurestinus, Aucuba* may be planted at points furthest from the shade. They stand drip without injury. Those in italics are the best for dense shade.

TANKS: *Anxious.* If the soil is of a solid nature and not likely to yield to pressure, the brick walls of the sunken tank at the side may be made of 9-inch work set in cement or mortar made of lias lime; and space should be left between the outside of the walls and the soil, of say 9 inches, and this space to be filled in with fine concrete. The bottom in any case ought to be laid on a bed of concrete 1 foot thick, and formed of three layers of sound brick set on edge in cement. An 3-inch coating of Portland cement should be laid on floor and sides. Concrete is formed of 80 parts small pebbles, 40 parts sharp clean sand (river), and 10 of ground lime; mix first in the dry state, and then throw water over it to make the mixture perfect, turning it once or twice with the shovel. No time should be lost in using it; and its deposit should be so managed that when tipped from the barrows it will get a fall of several yards, the mass being thereby driven closer together. A layer of concrete 7 or 8 inches thick should be allowed to set before adding another. Height of elevated tank:—The bottom should be 10 to 20 feet above the top of the *Cucumber-houses*.

TOMATO TO BOTTLE: *Constant Reader.* As you would *Gooseberries*, but they do not keep well. Can any reader suggest a better method?

UNITED HORTICULTURAL BENEFIT AND PROVIDENT SOCIETY: *G. W. W. Collins*, 9, *Martindale Road, Balham, S.W.*

Prices from £25, including Pump and Timber Supports.

May 27, 1893, The Dell, Englefield Green, Surrey. ROBERT WARNER & Co., Engineers, 27, Jewin Crescent, E.C. Dear Sirs,—It affords me much pleasure to inform you the 25 ft. Annular Sail Windmill, on 40 feet timbers, working a set of 3 in. x 9 in. stroke treble pumps, that you fixed here for Baron Schröder, is giving very great satisfaction, pumping the water through 4,224 feet of pipe, to a vertical height of about 80 feet. I must also express my thorough appreciation of the manner in which the whole of the work has been so successfully carried out.—Yours faithfully,

H. BALLANTINE, Head Gardener to Baron Schröder. We have a similar Mill and set of Pumps in hand for Lord Northbourne.

FIXED.

THE IMPROVED GARDEN GULLY (VINCE'S PATENT).

This useful invention is a great improvement on the ordinary Garden Grating, and is especially suitable for hilly walks and drives. As they never get stopped by rubbish or sand they effectually prevent the washing away of the gravel in heavy storms, and they save half the labour in cleaning out the cesspools. The prices are:—

8 in., 2s.; 10 in., 3s.; 12 in., 6s. 6d.

(The larger sizes are very strong for carriage drives.) Full Particulars and Testimonials on application.

VINCE & VINE,

58, Chester Road, Upper Holloway, London, N.

JOURNEYMAN, in the Houses, in a good establishment.—W. HILL, Gardener to Sir Charles Shakerley, Bart., Somerford Park Gardens, Congleton, can highly recommend a young man as above.

JOURNEYMAN.—ROBERT SELL, Osbaston Hall, Hinckley, seeks a situation for his son (age 15) as above. Four years' experience.

JOURNEYMAN.—Age 20. Six years' experience Inside and Out; three years in present situation; highly recommended.—A. S., Carshalton House, Carshalton, Surrey.

JOURNEYMAN, in the Houses.—Age 24; used to Ferns, Palms, and general Soft-wooded Stuff.—SOLOMON, 23, Charles Street, Islington Green, London, N.

IMPROVER.—Lad (age 16), having had three years' experience in the gardens, seeks situation as Improver where three or more are kept.—BASIL STANLEY, Overbury, Tewkesbury.

IMPROVER, Inside.—Age 16; has been out before. Can have a good character. Bothy preferred.—H. WALKER, Kinver, Stourbridge, Worcestershire.

TWO GARDENERS.—Wanted to place a steady intelligent YOUTH of 19, with a Gardener, Florist, and Seedsman, with view to learn the business. Unexceptionable references.—Address, BROWN, J. W. Vickers, 5, Nicholas Lane, E.C.

TWO HEAD GARDENERS, &c.—Situation wanted in a Nobleman's or Gentleman's Garden, to learn the profession, or in a good Nursery Garden; age 19. Small salary to begin with. Good references.—W. DIGGLE, Outwell, Wisbech.

TWO GARDENERS.—Wanted, to APPRENTICE a YOUTH, age 16, in a good Establishment, to learn Gardening. Premium given.—R. GOODBURN, 31, Old Dover Road, Canterbury, Kent.

TWO GARDENERS.—A young man, age 20, wants situation in the bothy, as Inside and Out. Good reference.—W. J., 12, Mayfield Villas, Merton Road, Wandsworth, S.W.

TWO GARDENERS, &c.—Situation wanted by a young man, to Assist in Plant and Fruit Houses. Three years' character from present employer.—W. LEVETT, Benhall Lodge, near Saxmundham, Suffolk.

TWO GARDENERS.—Situation wanted in the Garden, Inside or Out (age 18). Bothy preferred. Good character.—H. B., 2, Stamford Road, Watford.

TWO GARDENERS.—J. HARRISON, Gardener, Swifts House, Bicester, Oxon, would be pleased to recommend a strong willing lad, age 17, who has had a little experience both Inside and Out.

TWO SEEDSMEN, &c.—Situation required in the Seed and Bulb Trade. Age 17; experienced; references.—G. T. W., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TWO SEEDSMEN.—Young Man seeks situation in Seed Firm. Five and a half years' good reference.—T. B., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TWO NURSERYMEN.—A young man seeks employment in a Nursery, having had nine years' experience in London Market Nurseries, and can show good references. Used to Growing Ferns and Bedding Stuff.—J. GOLDING, 41, Abercorn Road, Angel Road, Upper Edmonton, N.

TWO NURSERYMEN and OTHERS.—ADVERTISER seeks a situation in a Market Nursery or Private Place, as Grower of Roses, Carnations, Pelargoniums, Ferns, and other Flowers for Market, or for private purposes.—KIMPTON, 5, Evelyn Road, Ham, Surrey.

TWO NURSERYMEN.—Situation wanted in a Market Nursery by a young Man (age 21). Good character. Used to same.—G. F., Mrs. Pulham, Edith Cottages, Fourth Cross Road, Twickenham.

RICHARD CLEAVER (late Lichfield), is open for Engagement on Commission, or otherwise, Wholesale and Retail.—401, Stratford Road, Birmingham.

COLLECTOR of RENTS in the Country.—Age 33 years; fourteen years' character. Highest references; security if necessary.—X. O., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

ESTATE CARPENTER.—Age 31, married. Understands Horticultural Buildings, and all general work required on an Estate. Seventeen years' experience; excellent references.—A. ROSS, 13, Westbury Road, Westgate-on-Sea.

ASSISTANT, five years' Retail experience in Seeds and Bulbs, seeks re-engagement. Wholesale or Retail.—N. R. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

CLERK.—Advertiser requires a situation as above; experienced in the Nursery and Seed Trade Offices, Book-keeping &c.—Good references.—P. H., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, London, W.C.

TWO FLORISTS.—Situation wanted by a respectable young man, age 24; well up in General Market Stuff; eight years' experience.—X., 1, Roman Villas, Standard Road, Bexley Heath.

TWO FLORISTS.—A young MAN desires a situation. Well up in Window-boxing and Foliage; also Nursery-work. First-class testimonials.—C. P., 31, University Street, W.C.

TWO FLORISTS.—A young Man, age 25, steady. Can make any Design in Floral-work; also good Salesman. Fifteen years' experience in Markets and Shops. Requires position as Shopman, Manager, or Market Salesman. Highest references.—J. DAVIS, Sea, Tulketh Street, Southport.

THE MANY CHANGES that are taking place in our midst prove that, to keep pace with the rapid march of progress, we must strain brain and muscle to their utmost tension. There is no time for pausing to watch our neighbours, because there would be a danger of our getting elbowed out of the race altogether. The man who hesitates is indeed lost for others will grasp the prize whilst he is wondering whether it is advisable to take it. It is the same in dealing with disease. Unless we destroy it when first attacked, it will overmaster us. Holloway's Pills and Ointment are the best medicines for the cure and relief of all complaints at all seasons of the year.

Select from.

AMATEUR GREENHOUSES.

SPAN ROOF.

THESE GREENHOUSES

LEAN-TO.

are made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy man or gardener in a few hours. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16oz glass throughout. All parts are neatly packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

100ft.	10ft.	9ft.	50 0 0	70 0 0

Deduct 10 per cent. if required for brickwork.

SPECIAL NOTICE.

Owing to the greatly increasing demand for my Amateur Houses every autumn, and having to refuse so many orders last season through customers not booking their orders early, I should feel greatly obliged if intending purchasers of my Greenhouses, &c., would place their orders early, even if they do not require dispatch until later in the season; they will thereby enable me to cope better with the great autumnal pressure. **Avoid disappointment.**

If William Cooper's Houses are not the Cheapest and Best Value for Money in the Trade, how is it he sends more Houses off in one week than any other maker in one year? Do not be misled by other makers copying my blocks and prices. Call and see the materials used, and the Houses being made. Works cover over 5 acres of Ground.

Long.	Wide.	High.	Packed on Rail.		Erected within

Deduct 10 per cent. if required for brickwork.

When ordering, it should be stated at which end the door is required (when facing front of house from outside); if desired, it can be inserted in front.

"INVINCIBLE" HOT-WATER APPARATUS.

Tenant's Fixture.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE.

Requires no sunk stove-hole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all.

Securely and carefully packed on rail at the following respective prices:—

SIZE OF HOUSE.	PRICE.

THE LARGEST STEAM HORTICULTURAL WORKS IN THE WORLD.

Telegrams: "CONSERVATORIFS. LONDON."

Telephone: No. 4652.

AMATEUR GREENHOUSES.

SPAN ROOF.

THESE GREENHOUSES

are made especially for Amateurs at a nominal figure, thereby coming within the reach of those who require a strong but inexpensive structure, and being constructed in complete sections, are erectable by any handy man or gardener in a few hours. The framework is substantially constructed of red deal, the lower part being filled in with good, sound, well-seasoned, tongued and grooved matchboards. The house is fitted with door complete, with rim lock and brass furniture, painted one coat of good oil colour, supplied with all necessary ironwork and stages for each side, and good 16oz. glass throughout. All parts securely packed, and put on rail; or delivered, erected, and glazed complete, within twenty miles of London Bridge, at the prices mentioned on each side.

Delivered and Erected Complete within

SPECIAL NOTICE.

Owing to the greatly increasing demand for my Amateur Houses every autumn, and having to refuse so many orders last season through customers not booking their orders early, I should feel greatly obliged if intending purchasers of my Greenhouses, &c., would place their orders early, even if they do not require dispatch until later in the season; they will thereby enable me to cope better with the great autumnal pressure. Avoid disappointment.

If William Cooper's Houses are not the Cheapest and Best Value for Money in the Trade, how is it he sends more Houses off in one week than any other maker in one year? Do not be misled by other makers copying my blocks and prices. Call and see the materials used, and the Houses being made. Works cover over 5 acres of Ground.

Deduct 10 per cent. if required for brickwork. When ordering, it should be stated at which end the door is required (when facing front of house from outside); if desired, it can be inserted in front.

"INVINCIBLE" HOT-WATER APPARATUS.

MOST EFFICIENT AND CHEAPEST IN EXISTENCE. Requires no sunk stove-hole and no brick setting. Will last all night without attention. Will burn house-cinders, therefore costs next to nothing for fuel. Anyone can fix it. A child can stoke it. Success guaranteed.

Cost of complete Apparatus for Greenhouses, with 4-inch pipes, flow and return along one side cut and fitted; so that if the internal measurement of the Greenhouse is given, the Apparatus will be sent completely ready for fixing, an advantage which will be appreciated by all.

Securely and carefully packed on rail at the following respective prices:—

SIZE OF HOUSE.	PRICE.
7ft. by 5ft.	£2 15s.
9ft. by 6ft.	£3
10ft. by 7ft.	£3
12ft. by 8ft.	£3 5s.
15ft. by 10ft.	£4 5s.
20ft. by 10ft.	£5 5s.
25ft. by 10ft.	£6 5s.

The following are extra:—Set of Stoking Tools, 2s. 6d.; Cap to Stove Pipe if required, 1s. 6d. Estimates for complete Apparatus for any sized house, free on application.

IMPORTANT.

I respectfully beg to inform all readers of this Paper that the first edition (100,000 copies) of my Revised PRICE LIST, consisting of 400 Pages and about 1200 Illustrations, bound in cloth, is now in preparation, and will be published in about three weeks, when I shall have much pleasure in forwarding to every person who has applied for a Price List up to August 24th of this year one post-free, and to all persons, during the next few days, who send Three Stamps for postage, after which the price will be One Shilling each, post-free. This List will be the most Complete in the trade, and has cost several thousand pounds to produce.

W. COOPER,
755, OLD KENT ROAD, LONDON, S.E.

FERNS AS ART MODELS.

ALTHOUGH from the strictly botanical
point of view all abnormal forms of
Ferns or flowers are termed "monstrous," the
word is obviously misplaced when applied to
symmetrically-formed and thoroughly healthy
types produced in a wild state, and there-
fore as natural in their origin as those
which are ranked as normal. Now, it is a
curious fact, that though conventionally treated,
we frequently find Fern frondage used in a
decorative way in woven fabrics, such as table-
cloths, curtains, and so on. Yet we have never
come across a single instance of adaptation of any
other than the common or normal fronds, the
wonderful capacity for ornamental development
with which Nature has endowed Ferns, and
especially British Ferns being apparently lost
sight of altogether, though the wealth of sug-
gestions existing in this direction is simply
inexhaustible. Take, for instance, the frond of
the common Lady Fern. Normally we have a
somewhat stiff midrib flanked on each side with
a symmetrically tapering row of once divided
pinnae. This frond, it is true, in the course of
its development affords many highly-decorative
phases of delicately inrolled curves, ranging from
the first spiral untwisting of the central stem to
its later pendulous crozier-like beauty just pre-
ceding its complete unrolling. Each stage affords
innumerable object-lessons all as full of grace
and possibility of enriched development as
any Acanthus leaf that ever inspired the Greeks.
Yet how rarely do we find even this stage avail-
ed of, the flat, fully developed frond meets us
everywhere, but the more beautiful incipient
stages rarely. Then, again, in this connection
every species has its own peculiarities, the Shield
Ferns, to wit, turn themselves, as it were, inside
out, the unrolling frond bending over back-
wards, forming a reversed crozier. The Hart's-
tongue unrolls itself like a narrow scroll. The
mountain Buckler Fern and marsh Buckler Fern
both shake their little pinnules loose ere the
ball-like head of the unrolling frond uncurls, so
that the head seems to bristle with delicate
recurved points. All these features, if carefully
studied as artistic texts, would be capable of
wonderful development as decorative types for
draughtsmen, sculptor, and architect, and in
our mind's eye we can picture a series of capitals
worked up from the themes he suggests which
would fitly grace the noblest building ever
conceived by architect. All this, however, relates
only to the inherent beauties of the common
Ferns. But what is to be said for our innum-
erable Art students, all eager for fresh fields and
pastures new, that they have never hit upon the
marvellously tasselled and extra plumose varieties
as educational subjects for their pencils? Here
we have not only infinite variations of every

detail of the flat, once or twice divided fronds aforesaid, but we have the apices of these divisions, even to the tertiary subdivisions spreading out into the more charmingly imagined tassels conceivable, ramifications innumerable filling up with delicate diapering the whole ground-work of the picture, and exhibiting endless modes and methods of treatment of the most ornate character conceivable, and yet so delicately and symmetrically adjusted and arranged as to be perfectly graceful and free from any feeling of over-elaboration. Here, too, of course the incipient stages are varied *ad infinitum*, the tassels unrolling in all attitudes, of pendulous beauty, and spreading out as they develop into it may be a myriad-stranded bunch of fine filaments branching again and again into a veritable mosslike ball, or a broad-fingered starlike flat tassel like a finely-fringed glove.

Outside these elaborate types again, there are scores of variations which though simpler in design, are by no means less pregnant with artistic suggestion. The revolute variations, for instance, afforded by several species, and of which we may take as the extreme type *Athyrium f.-f. revolvens*, two forms of which were found together in Scotland, one in which the normal frond, after assuming the usual flat form of the species becomes symmetrically rolled backwards in all its divisions, the frond itself curving at the tip to such an extent, that it forms a dependent spiral; the side divisions do the same, and the pairs of tertiary ones besides being distinctly convex in cross section, form semicircles. The other find has the fronds and side divisions only recurved, and the tertiary divisions quite flat; and it is a moot point where is the more beautiful.

Now, here is a type built up entirely of lines of beauty which so far as we are aware has no parallel at all among the myriad other vegetative forms in Nature, and yet produced by the simple continuance of growth of the superior superficial cells after the frond is normally matured. A like abnormal continuance, affecting the plant generally, instead of partially, has yielded the splendid group of frilled and fimbriated Hart's-tongue (*Scelopendrium v. crispum*), in which the plain, flat, strap-like frond is transformed into frills of the most ornate description, the bold convolutions of which would admit of their artistic use to great advantage.

Obviously, nothing short of the plants themselves, as they live and grow under congenial conditions, would be of any use whatever in this connection to the Art-student. The best collection in the world of pressed fronds, or even such Nature-prints as have been produced by Colonel A. M. Jones; or in Moore's folio edition of *Nature-printed British Ferns*, fail altogether to convey the grace and beauty of the living Fern, many of the most charming types, such as the revolute and frilled ones aforesaid, being crushed out of recognition by any process which involves either drying or printing from an impression; while with the more elaborate ones, in which the divisions may overlap to such an extent as in places to be three or four deep, the printing process is altogether inapplicable. Fortunately, however, the grand collection existing at Kew embraces the *élite* of the varietal forms, and though some of them would develop their specific beauties to greater advantage under glass than in the open, the Art-student who may wish to avail himself of the hints we give, would find ample material for his pencil, and be well repaid for not merely one visit, but many. *Chas. T. Drury, F.L.S., F.R.H.S.*

NEW OR NOTEWORTHY PLANTS.

PHALÆNOPSIS FUGAX, n. sp.*

A VERY curious *Phalænopsis*, the closer affinities of which are at present very little known. The whitish

* *Phalænopsis fugax*, n. sp.—Folius cucucato-oblonga viridibus unicoloribus 4-5 poll. longis, ad 1 poll. latis; racemo sublongiore cataphyllis 1 v. 2 vestito, supra clavato paucifloro

or pale yellow flowers open about 9 o'clock in the forenoon, and begin to fade at 2 or 3 o'clock of the same day. This striking fact (for a *Phalænopsis*) was observed in two following years by Mr. White, Orchid grower to Sir Trevor Lawrence, Burford Lodge, to whom I am indebted for fresh materials. The most striking part of the flower is the middle lobe of the lip, which is contracted to a globular hollow body, furrowed at the top, and with an obtuse pointed cone before; the lateral lobes are linear, erect, and in the way to be shown very often in other *Phalænopsis* species. It is by no means a beauty in the genus, but interesting for a new type of the labellum. *F. Kränzlin, Berlin.*

JAPANESE HORTICULTURE.

THE following extracts are taken from a paper read by Mr. Henry Izawa at the nurserymen's Congress at Chicago:—

DWARFING PLANTS.—The art of dwarfing plants is so little known in other lands that a short description of its process is not out of place here. A few examples will suffice to give you a general idea. The successful Japanese nurseryman must not only be a good grower, but he must also be an artist, conversant with the general arts and customs of his country, which differ very materially from those of any other country.

The Pines may be considered the most important of all trees in Japan, and great care is taken of their cultivation and preservation. The most popular ones are *Pinus densiflora*, *P. parviflora*, and *P. Thunbergii*. They are generally grown from seed, and great care is taken to select the choicest qualities. In the spring of the second year, when the seedlings are about 8 inches high, they are staked with Bamboocanes, and tied with Rice-straw, the plants being bent in different desirable shapes. The next fall they are transplanted to a richer soil, and well manured. In the following spring the plants are re-staked and twisted, and tied in fanciful forms. This mode of treatment is given until the seventh year, when the trees will have assumed fairly large proportions, the branches being trained in graceful forms, and the foliage like small clouds of dense green. The plants are now taken up and potted in pots I and I½ foot in diameter, and are kept well watered. Every succeeding year great care must be taken of new shoots, which must be kept pinched back. After another three years of this treatment, the trees are virtually dwarfed, there being no visible growth thereafter.

The dwarfing of Bamboo is another important branch of the Japanese nursery business. Three weeks after Bamboo shoots begin to grow, and when the trunks measure about 8 inches in circumference and 5 feet in height, the bark is removed, piece by piece, from the joint. After five weeks, when the plants get somewhat stout, bend and tie the stem zigzag; after three months, when the side-shoots grow strong enough, cut them all off 5 or 6 inches from the main trunk; they are then dug up and potted in sand—care should be taken not to use any fertilizer, but plenty of water should be given. Cut off the large shoots every year, in May or June, and after three years the twigs and leaves will present admirable yellow and green tints.

Dwarfed *Thuia*s are effected by means of grafting. Let a *Thuia Lobbi*i [= *gigantea*] seedling grow on fertile soil for three years, or until it becomes about 5 feet in length; then in the middle of spring cut off all branches, leaving the trunk and top branch; take a quarter-inch chisel, and hammer it into the thickest

bracteis minutissimis triangulis acutis quam ovaria pedicellata multoties brevioribus; sepalis dorsali petalisque ovato-linearibus acuminatissimis, sepalis lateralibus ter latioribus ovatis acuminatis; labelli bene brevioris unguelineari, lobis lateralibus erectis lineari-oblongis antice rotundato-rotundis, lobo intermedio in basi v. isthmo, callo conico obtuso instructo, ipso globuloso antice sulcato intus vacuo nudo; gynostemio brevi, anthera antice longe producta; pollinibus et fovea stigmatica pro gynostemii magnitudine maximis, rostellis lineari. Totus flos vix pollicem diametro, albidus v. stramineus; labelli lobis laterales violaceo-striati. Flores fugaces vix 5 v. 6 horas durantes. *F. Kränzlin.*

portion of the trunk, hollow out a 1-inch deep hole to every 2 or 3-inch space, so that the trunk can be bent more easily in the desired direction. Rice-straw is twisted round the trunk, which is bent in many curious forms and fanciful shapes. In spring-time of the second year of this treatment, the plants are potted in rich soil; in another two years, when the plants have assumed permanent forms, *Thuia obtusa* is then grafted on the *Lobbi*i stem.

GRAFTING.

The process of grafting is, in brief, as follows:—Apply plenty of manure to the *Thuia Lobbi*i plant; in early spring take some 2-inch shoots of *Thuia obtusa*, cut the end in a slanting plane, and insert in the smaller portions of the *Thuia Lobbi* trunk one graft to every inch on the trunk; wrap the grafts with Rice-straw, and take the plants to a shady, draughtless room, with the temperature at 35° F. Increase the temperature one or two degrees daily; continue this for three weeks, by this time a little breeze may be admitted, and leave the temperature of the room 60° for two weeks, and at 70° for two weeks; leaves will soon grow from the grafted twigs. In the latter part of spring, when the temperature in and out-of-doors becomes uniform, the plants can be safely transferred to some shady position out-of-doors. In the fall, when all the grafts have taken good hold, cut off all the remaining shoots of *Thuia Lobbi*. Transplant every year in good rich soil; six years will be sufficient to produce handsome specimens of dwarfed *Thuias*.

All kinds of Conifers are treated in a similar manner. There are also a great demand for curiosities in mixed grafted Conifers; that is, six or seven kinds of Conifers on one plant.

Maples form one of the best materials for the artistic fancies of the Japanese craftsman. Often a great many different varieties of Maples are grafted on one stem. Seedling Maples are spliced and tied together when growing; after they have formed an union, the desired shoot is cut off—this is kept up until ten or twenty varieties are obtained. Maples thus grafted form lovely features for lawns, their varying hues and types of foliage enhancing each other's beauty.

MINIATURE LANDSCAPE GARDENING.

Now, a few words regarding our miniature gardening. The æsthetic idea shows itself in every line of Japanese industries, and especially is it the case with our nursery and landscape gardeners. The most inexperienced need not fear any difficulty in our mode of gardening if he but uses his mind and efforts in the right direction. The skilful artist introduces into his miniature garden, not regular geometrical forms, but anything odd, irregular, and artistic. To us gardening is not mathematic, but an art—hills, dales, rivulets, waterfalls, bridges, &c., vie with each other in presenting their quaintest forms and fancies, and harmonious symmetries. Dwarf plants of all descriptions deck the scene here and there in thousands of peculiarly artistic shapes. We derive many lessons from Nature, and endeavour to imitate her as much as is practicable, although on a smaller scale. It is in the person of a Japanese gardener that Dame Nature finds her most ardent lover; his is the ambition to make his country a place for men like Arnold to flee to when seeking a studio to the beauties of the "Light of the World."

PLANT NOTES.

DIANTHUS GALLICUS (PERSSON) SYN. D. ARENARIUS (THORE).

This must not be confounded with *D. arenarius* of Linnæus, which is figured in the *Botanical Magazine* (t. 2038), and is a very distinct plant. The only portrait I can find of *D. gallicus* is in Wooster's *Alpine Plants*; it represents only the flower, but is good as far as it goes. The leaves are thick and glaucous, and the stalks very long and creeping; the whole plant somewhat resembles an enlarged and drawn-out *D. cæsius* with fringed flowers. It is very

late in flowering; the flowers are pale pink, and very fragrant. It is a native of the sandy coast along the whole circuit of the Bay of Biscay, extending into Portugal. It is very abundant near Biarritz, extending some distance inland on the sand-hills of the maritime Pine-woods, but growing also close down to the sea level. By giving it a depth of 2 feet of pure sand in a sunny corner of my garden, I have made

first time this season. White Queen is a free-branching and profuse-flowering variety, about 9 inches high, the flowers being large, well-formed, and, as the name implies, white—pure white. Planted by itself in beds, it is very telling when contrasted with masses of scarlet, pink, and other distinct shades of colour. *H. W. Ward, Longford Castle Gardens.*

autumn nearly every wood produces them in plenty, and there is no doubt that Dr. Plowright traced some case of Mushroom poisoning to this source. It is rarely that the species causing the mischief can be accurately determined, after these accidents, but fortunately Dr. Plowright was a practical mycologist, and soon discovered the cause. We have considered it of advantage to give a figure of this enemy of the unwary, with a few particulars of its history. The pileus, or cap, is from 3 to 4 inches broad, with rather a viscid skin, soon becoming expanded and rather flat. Sometimes the top is quite naked, at other times patches of the volva-membrane, irregular in size and shape, are adherent. When growing exposed to the sun, the colour is whitish, or pale lemon-yellow, but in more shady places with a dull greenish tint, or pale olive. The gills are free from the stem and white, broadest in the middle, and narrowed towards each end. The stem is from 3 to 5 inches high, solid at first, but becoming hollow, bulbous at the base, with a large drooping white collar or ring towards the top, and a volva or sheath at the base, the lower portion of which is grown to the bulb, the upper margin being torn and loose. When quite young, the cap is enclosed within a membranaceous coat or volva, with the form of an egg, but with the growth and elongation of the stem, this volva is broken irregularly, and the young cap rises on its stem, carrying up with it fragments of the torn volva attached to its surface, whilst the residue remains like a ragged membrane attached to the bulbous base. Whilst still fresh, this fungus has very little odour, but soon after being gathered it smells more strongly, becoming more or less stinking in decay. The odour faintly resembles that of the Stinkhorn (*Phallus*), and hence the name.

There is a variety which is pure white, sometimes called a distinct species, under the name of *Agaricus vernus*, which only seems to differ in colour, and less fetid odour, but it is equally dangerous. In both forms the spores are white, and the substance rather soft and fragile, so that we cannot imagine how any sane person can possibly confound them with the common Mushroom. *M. C. Cooke.*

FIG. 56.—STINKING WARTED CAPS: *AGARICUS PHALLOIDES*, PALE YELLOW OR GREENISH.

HYBRIDISATION: ITS BENEFITS AND RESULTS TO ORNAMENTAL HORTICULTURE.*

It may fairly be said that three great agencies have been at work during the past century to increase the number of cultivated plants. These have been the introduction of new species, the selection of sports, and the hybridisation of species already in cultivation. It would be hard to say which of the three agencies has been the most potent, but it is a fact that many of our choicest garden ornaments of to-day are neither species nor sports, but hybrids that have themselves been so crossed and recrossed that to unravel their parentage would be hopeless. As proof of this, we need only cite the Pinks, Pelargoniums, Begonias, Heaths, Rhododendrons, Gloxinias, Gladioli, &c. Such results are the best possible proof that hybridisation has immense possibilities for the florist. The great improvement of many hybrids over either parent is a valuable feature in itself.

Though it is now approaching two centuries since Fairchild raised the first hybrid that was recognised as such, it is scarcely more than half a century since gardeners started in earnest to the work of hybridisation. Kölreuter may well be designated the father of hybridisers, for from 1760 till near the time of his death, in 1806, he devoted his best energies to the scientific rearing and comparison of parent and hybrid forms. The altogether unexpected results he obtained in crossing species of such genera as *Dianthus*, *Malva*, *Lobelia*, *Nicotiana*, and *Mirabilis*, at once showed the way, and supplied the stimulus to gardeners, who—to their praise be it said—were not blind to the hint thus furnished. But the gardening world was first aroused to the height of anticipation when a couple of well-known cultivators entered the

A POISONOUS FUNGUS.

AGARICUS (AMANITA) PHALLOIDES, FRIES.—There is rather strong evidence that this is one of the most poisonous of British fungi, if not really the very worst. It resembles a little the celebrated Fly Agaric, but the brilliant red of that species is in itself a warning, whilst the present is more subdued in its colouring, and much more common. In the

it grow luxuriantly and flower abundantly; but its special requirements will prevent its becoming a common plant in cultivation. *C. Wolley Dod, Edge Hall, Malpas.*

ASTER, WEBBS' WHITE QUEEN.

This charming variety of the somewhat stiff Aster has been very much admired by visitors to these gardens this year, where it has been grown for the

* Presented at the St. Louis Convention of the Society of American Florists by Dr. J. M. Macfarlane, Lansdowne, Pa.

field in the persons of R. Gowen, gr. to Lord Carnarvon, and Dean Herbert, the amateur but enthusiastic florist. As the two brought forward successive crosses of the then fashionable *Ericas*, as well as of *Rhododendrons*, *Gladioli*, and *Amaryllis*, that still find high favour, the natural outcome was that every gardener became a hybridiser. During the first half of this century, therefore, the number of garden hybrids increased greatly, while the price at times realised for some lucky batch of seedlings was a windfall to the owner.

More recently, the careful scientific experiments of Gärtner, Naudin, Godron, Wichura, and Darwin have given a firm foundation to the subject, while the innumerable varieties of *Pelargoniums*, *Fuchsias*, *Rhododendrons*, *Petunias*, and *Orchids* testify that the florist has not been resting on the laurels which his predecessors gained. But all this notwithstanding, he has too often approached his experiments in a very hap-hazard frame of mind. True, some of the leading continental firms so realised the importance of the work to be done, that they engaged men for it who became specialists. Dominy, Seden, Kellermann, Turnbull, Grieve, and others amply deserved the name. Like other industries and pursuits, the rearing of hybrids is one of the importance of which has not been fully realised in America. Till within the last few years, there has not existed here the type of wealthy, leisured, and cultured men, who can appreciate such products, and are prepared to spend large sums in order to obtain them. But while a change for the better is at present going on, is it not true that this country has at times fulfilled its mission best when it has gone outside itself to compete with other nations? Why should it not do the same in the production of new and valuable crosses? I am glad to know that already a beginning has been made, and that hybrid Orchids from American raisers have been willingly awarded their meed of praise.

System and method are characteristics of the universe, and should be also of those who propose to enter the list of hybridisers. Want of system and method has sadly shown itself in the past, so that the market has been flooded with hybrids whose parentage is unknown, and the means adopted for the obtaining of them is unrecorded. Every gardener, then, should have a pocket notebook as a constant and cherished companion. I could not help admiring the system adopted by a well-known Orchid-grower of England, whose stock of hybrids is almost without a rival. A large well-bound volume contained a record of every experiment conducted. The time of opening of the parent blossoms, the date when cross-pollination was effected, remarks on the ripening of the capsule, the period when it was plucked, the time of sowing of the seeds, and the nature of the soil in which they were placed, the first appearance of the seedlings, and the date when these were pricked off into pots, were all duly entered. By such means he commanded success, and it has come to him. How unlike the all too common reply made by many, when asked only it may be as to the parentage of a cross, "Well, Golden Queen was the seed parent, and I think Silver Gem was the male."

If it be asked now, "What flowering plants will hybridize?" the answer is difficult to give, for our sad lack of knowledge on many points must be confessed. It has been demonstrated that the pollen grains of one species when put on the stigma of some species belonging to a different order, or even sub-class, will protrude pollen tubes that may reach the ovary or even the ovule. But the operation seems to be largely physical, and there stops. It can be laid down as an ascertained law that only forms which are more or less related to each other will cross. But we do not mean to imply by this that in habit, environment, flower-colour and odour the two should resemble each other closely. Witness the hybrid between the slender, twiggy, small-flowered *Rhododendron Dauricum* and the tall, large-flowered *R. arboreum*; or between the dense, wiry Patagonian shrub, *Philesia*, and the tall Chilean climber, *Lapageria*. These indicate to us the outer limits of possibilities, so to speak, but the fact that hybrids

of such never or rarely bear seed, teaches us that natural limits have been overstepped by human art. Since hybrids between species of *Dianthus*, *Pelargonium*, *Begonia*, *Petunia* and others are to a large degree fertile, this indicates that the inner limit shades off into cross fertilization of individuals of the same species.

A very important matter in hybridisation is the skilful and judicious selection of appropriate parents. It seems inevitable that embryo hybridisers always attempt at first to get marvels, rather than improvements. They wish to lead Nature, instead of being content to put their hand in hers. "Improvement" then should be the hybridiser's watchword, and we predict that this can best be attained by a thoughtful study of the parent species. Let us illustrate by one or two cases. The deservedly-popular and early-blooming *Rhododendron Nobileanum* is a cross of the low-growing, white-flowered *R. caucasicum*, with the magnificent scarlet *R. arboreum*. But, as grown in English gardens, the leaves of the former parent are liable to the attack of an insect that riddles and browns them. The weakness is powerfully inherited by the hybrid offspring, and is decidedly against it in the florist's eyes. The selection of our native *R. catawbiense* instead gave the well-known strains of which John Waterer is an example, and these are free from the defect indicated.

No better illustration can be given, I think, of the inferior qualities of two selected parents being subordinated to the good points of both in the crossed offspring than in *Nepenthes Mastersiana*. This form has done more to popularize the pitcher plants than any species or hybrid yet brought forward. The one parent, *N. sanguinea*, has ample bright green leaves that bear scarlet-crimson pitchers of graceful shape and large size. But the plant tends to become "leggy"; its pitchers rather inconstantly, and is often difficult to propagate. The other parent, *N. Khasiana*, has narrow gray-green leaves, long narrow pitchers of a greenish hue tinged and streaked with brick red—not highly desirable acquisitions—but its pitchers at every leaf usually, and is easy of cultivation. The hybrid, in habit, in leaf form, and colour, in shape and colouring of the pitcher, and not least, in its free mode of propagation, is all that could be desired.

Since it is a general rule that as we approach the tropics the wealth and colouring of flowers increase, one aim should be to cross good hardy forms with others of a more tender kind, for people do not want to grow all their plants the year round in glass-houses, if they can do otherwise. Then, too, since hybrids remain truest in type when propagated otherwise than from seeds, if one proposed parent that has good points, be an annual or biennial, one that is perennial should be chosen as the other parent. Good illustrations of this are to be found both among natural and artificial hybrids. "Habit" is an important item with florists, and the improved crossed strains of *Begonia*, *Canna*, &c., are known to all of you. The quality of the flowers, however, largely determines the value of the plant. But "the quality of the flowers" is a complicated problem, since size, shape, colour, perfume and duration may all have to be considered. A skilful study of these may insure a hit when otherwise there would be mediocrity or a failure. Few hybrids in their blooms set off the good points so well as one that has had a wide though questionable reputation, and yet is little known to cultivators. I refer to *Bryanthus erectus* of Graham; a well-grown plant of this, not to say a bed of it, is a sight indeed. As colour is an important consideration, needless effort may be saved by avoiding the crossing of species that have yellow and purple, or scarlet or dark blue blossoms. While I know a good many ugly combinations of the above, the only passable one is that between the cardinal and blue *Lobelias*, which is not uncommon in the wild condition with us, and has repeatedly been produced artificially.

All experimenters practically agree that some genera and species cross much more readily than others. Where striking differences exist in the structure of the two parents, the probability of

blending is correspondingly reduced. In spite of this the man would be rash who would attempt to predict with our own present knowledge that certain species cannot be crossed. Look up the literature of twenty years back and you will read that the Carrant and Gooseberry, the red and blue Pimpernel, as well as others that might be named, refused to blend. Yet we have hybrids of them now. They yielded to steady and determined effort. The group of Orchids, however, should be an example and encouragement to all. Till within the last quarter of a century few artificial hybrids, and only a few wild hybrids of the Orchid order, were known, the order itself being viewed as of minor hybridising capacity. But the rage for novelty and improvement taxed the skill of the gardener, while the prices willingly paid for good novelties furnished the incitement. He set himself to understand the curious structure of the flower, and to his aid came Darwin's classic work. The order now stands first as having furnished the greatest number of hybrids, the most varied combinations, and the most beautiful results. It cannot be too strongly stated, however, that these achievements have been accomplished by a skilful selection of parents, and a knowledge of the cultural treatment that best suits them from the seedling on to the adult's age.

(To be continued.)

THE LARGEST WILLOW TREE IN ENGLAND.

A LINCOLNSHIRE correspondent sends the following particulars regarding the large Willow in Haverholm Park. The last measurements, which were taken twelve years ago, are as follows:—At 1 foot from the ground it measured 27 feet 4 inches round; at 4 feet, it was 20 feet 5 inches; but at 7 feet, owing to the protuberances at the base of the limbs, it was 28 feet in circumference. About 8 feet from the ground it breaks into eight large limbs, each equal to an ordinary-sized tree. The spread of branches was on one side 40 feet, and 28 feet on the other; and the tree, which is of the *Huntingdon* species, is about 40 feet high. It is perfectly sound in bole and limb, and quite healthy, though its age is given as 1000 years. It stands on a slight elevation, very like the bank of a river; indeed, one can easily trace an indentation of the surface, pointing probably to the ancient bed of the river Slea. A Gooseberry bush grows from a hollow between two of the branches, and a Thorn tree has sprung up lower down.

NORTHWICK PARK.

THE Worcestershire residence of Lady Northwick is in the extreme south of the county, and within 2 miles of Blockley Station. The hall is situated on a gentle slope in an extensive and beautiful park planted in grand old English style with Oaks and Beeches principally, which give shade and shelter to the numerous deer who can browse up to the front door without hindrance of terrace, flower-garden, gates, or barrier of any kind. Space, grace, freedom, and breadth of effect, combined with simplicity, seem the characteristics of the place.

The estate is extensive, well-appointed, and well-managed. The number and size of allotments provided for the workmen and cottagers on the estate, is much greater than is usual upon estates, and, in conjunction with the fact that Lady Northwick annually offers many prizes for the encouragement of the better cultivation of allotment-gardens, prove conclusively that the welfare of the poor is a matter in which her ladyship takes great interest. I think there are more than 150 acres of land in allotments.

The flower-garden is entered at the left of the mansion, and is in old-fashioned style on undulating turf. Standard Roses, and beds of Everlasting-flowers; beds of *Petunias*, and *Zinnias*, and *Asters*, and *Calceolarias*, yellow and red; masses of *Pelargoniums*, crimson, scarlet, orange, pink, white; rows of *Centaurea*, *Lobelia*, *Tagetes*, *Perilla*, &c. The

beds and borders at the time of my visit (August 28) were well filled with brilliant colours. The best Pelargoniums were Waltham Seedling, Brilliant, Veuvius, Henri Jacoby; and last, but not least, the grand old Indian Yellow of Donald Beaton. This was quite a treat.

The kitchen garden department covers about 6 acres, including orchard. On entering at the garden-door, one is struck by the gorgeous display of Asters on a border 60 yards long, and which are again continued on another border at right angles in front of the long range of vineries. The flowers are superb, especially those of Ne Plus Ultra and Dwarf White Victoria; and the display may be imagined when it is stated that Mr. Hillier grows 3000 plants of Asters. The drought has scarcely made itself apparent at Northwick in any department of the garden. The Onions are excellent, particularly Veitch's Main Crop; for, measuring the first to hand, I found that it was rather more than 13 inches in circumference, and there were hundreds of bulbs as large, and larger. These were sown on March 9. Brown Globe were very fine, and James' Keeping fully up to its well-known standard. Veitch's Model Cauliflower has been, and is, at Northwick of first-rate quality, and deserves all that can be said in its favour; also, the Mammoth Scarlet Runner of the same firm is a favourite variety; and Canadian Wonder Kidney Bean has maintained its reputation for abundant cropping. Celery is grown of high quality, and in great quantity; and Potatoes are grown as they ought to be, i.e., with plenty of space.

The best crops of Pears were Glou Morceau, Marie Louise, Pitmaston Duchess, and Williams' Bon Chrétien, 2½ bushels of extra-fine fruit of the latter being gathered from one tree on the garden-wall. Plums have been good; Blue Imperatrice on a wall was a picture of beauty. Apples are plentiful here, and in great variety, amongst them may be mentioned Blenheim (brown and white varieties), Ribston Pippin, Sturmer Pippin, King of the Pippins, Peasgood's Nonsuch, Reineette du Canada, Cellini Pippin, Lord Suffield, Hanwell Souring, French Crab, Hawthornden, D. T. Fish, the uncommon Calville Rouge, and good old Normanton Wonder syn. Wellington, Dumelow's Seedling, all bearing heavy crops of fruit.

The vineries contain very good crops of Grapes, good in bunch, berry, and finish, of such well-tried varieties as Black Hamburg, Black Alicante, Mrs. Pince, Foster's Seedling, Trebbiano, West's St. Peter's, and Muscat of Alexandria. *J. Udale.*

ORCHID NOTES AND GLEANINGS.

LÆLIA PURPURATA VAR. FASTUOSA.

A VARIETY with lilac sepals, rosy-lilac petals, and a deep crimson lip. Flowered at L'Horticulture Internationale. *Lindenia*, t. 385.

LELIO-CATTLEYA EXIMIA X.

A magnificent hybrid raised by Mr. Seden out of Cattleya Warneri by *Lælia purpurata*. The flower-segments are broad, deep rosy-lilac, and the lip intense crimson, with a yellow blotch. *Lindenia*, t. 386.

MASDEVALLIA POURBAIXII X.

A hybrid raised by M. Pourbaix, of Mons, out of *M. Veitchiana* by M. Shuttleworthii. The plant is intermediate between its parents; the flowers are dull orange-red, covered with a multitude of little brownish-red dots. *Lindenia*, t. 387.

ODONTOGLOSSUM THOMPSONIANUM.

A form of luteo-purpureum, probably, with the segments clear yellow, heavily blotched with chestnut-brown. The oblong acuminate toothed lip is white, with a central orange blotch, and radiating lines of the same colour. *Lindenia*, t. 388.

FLOWERING OF THE LARGEST ORCHID.

It will interest our readers to know that the gigantic Orchid referred to aforesaid as the largest Orchid known, *Grammatophyllum*, has flowered this summer with Mr. Syme at Rangoon, with whom it produced a

grand inflorescence 6 feet in length. Its owner has grown the plant for three years, but this is the first season of its flowering; probably, like many other shy-flowering species, it may bloom fairly regularly once it has got into flowering trim.

ORCHIDS AT MOUNT HARRY, BRIGHTON.

Excellent well do the Orchids in the gardens of R. G. Fletcher, Esq., thrive under the skilful care of Mr. Garnett, the gardener at Mount Harry. The plan adopted is to grow the Orchids in houses where other suitable plants—not liable to harbour injurious insects—are arranged with them, and in many cases the results are truly remarkable.

The first division of the largest range has a rockery on each side of the entrance, in which a large specimen of *Hedychium coronarium* occupies the one side, on the other hand being an equally large *H. Gardnerianum*, and in both cases the plants are well in flower. On the stages are a few richly-coloured *Coleus* and other foliage plants, among which the Orchids luxuriate. Quantities of *Cattleya labiata* are sending forth flowers; a specimen of *Oncidium arcodes* has two spikes, which bid fair together to excel the number of flowers borne on one spike by the same plant last season, viz., 112. *Lælia tenebrosa*, *Vanda cœrulea*, *Dendrobium Phalanopsis Schroderianum*, and the showy *Odontoglossum grande* are very fine; and three plants of the pretty *Oncidium Jonesianum* bear between them nine beautiful sprays of flowers all differing in some respect.

In the second division, *Dipladenia amabilis* is making a fine display on the roof, and grand specimens of *Eucharis* are mingled with the Orchids, one pair having borne about ninety spikes each. Here the *Dendrobiums* are making marvellous growths; so strong, indeed, were those of *Dendrobium Dalhousieianum* that we took the measurement, and found one of the best pseudobulbs to be 3 inches in circumference and 4 feet 6 inches long, and still with unfinished growth, the specimens forming one of the best examples of Orchid culture we had ever seen. In this house *Cattleya Dowiana* was fine; the *Calanthes* and all the other specimens remarkably vigorous.

In the cool Orchid-house, the back wall is covered with *Luculia gratissima*, which some find difficult to grow, but which here thrives, and blooms profusely. A good collection of *Odontoglossums* is being got together; but although they seem to be growing well, it may be found that ultimately they will not give so much satisfaction as the Brazilian and other warmer-house Orchids, the soil here being almost pure chalk; and it has been said that *Odontoglossums* are more difficult to manage on chalky than on loamy or clay soil. Be that as it may, we are sure that failure will not take place for want of attention, for Mr. Garnett is very enthusiastic, and is fertile in expedients to meet emergencies. Among the cool Orchids, some *Odontoglossums* are in bloom, one, *O. bictonense* being an especially good form; varieties of *Cattleya Alexandra* show that they can be pretty, one of those here having a bright carmine lip and broad spotted petals; some forms of *C. granulosa* and *C. Gaskelliana*, too, are in bloom; *Lælia pumila Dayana* has fifteen fine flowers; the charming *Lælia monophylla* has blooms of a rich scarlet, and 2½ inches across; and *Zygopetalums*, *Oncidiums*, &c., help to make a show.

In the vinery, in which the young Vines planted two years ago have made grand canes, the resting *Dendrobiums* are placed; and in a sheltered corner of the rock garden the North American *Cypripedium spectabile* grows and flowers satisfactorily every year.

The present condition of the Orchids at Mount Harry gives a good warrant for the more extended culture of them which is there contemplated.

ABRAHAM'S OAK.

A BLOCK of the Oak of Mamre, or Abraham's Oak, has been deposited in the Kew Museum; it forms part of a branch broken off in a snow-storm. The Abraham's Oak was described and

figured by Sir J. D. Hooker in the *Linnean Transactions*, vol. xxiii. It is *Quercus pseudo-coccifera*, a common tree throughout Syria. This particular tree is supposed to indicate the spot where grew the Oak or the lentisk under which the patriarch pitched his tent, and is revered accordingly by Jews, Mahomedans, and Christians. Further particulars are given in the *Kew Bulletin*.

THE ROSERY.

IN THE ROSE-HOUSE.

HAVING a large span-roofed house of Roses, many of which are planted out into borders, a few notes upon seasonable work among them may be welcome, especially as there is much to do in this department during the coming month, if early blooms are required. Ever since the end of June this house has been open night and day, and at present the plants carry a fine lot of well-matured wood; about one-half of the foliage has fallen, and the borders are dry. During the next fortnight we intend trimming over the plants, and doing the little pruning necessary; but there will be very little of this to do, because the plants are grown chiefly for cut flowers, and I believe in cutting each bloom with a long stem. Not only does this enhance the value and beauty of a Rose, but it keeps the plants pruned into a closer and more useful shape. My readers must have noticed how persistently a Rose will break into new growth from the two or three upper eyes of

shoot from which bloom has been removed, while the lower eyes remain dormant. In this way a plant becomes loose and straggly in a very short time; therefore, I prefer to cut away freely when securing the blooms, and by so doing render them much more useful and showy for decorative purposes. I am writing now of the medium growers, like Catherine Mermet, Perle des Jardins, &c.; the climbers shall receive attention later on. I also cut a great number of buds for propagating, and find that those from under glass are much harder, and give a greater percentage of success than do Tea and Noisette buds from the open ground. This is more noticeable in other seasons than during the present hot and dry summer, when plants in the open have had wood much harder and riper than usual. From the above, it will easily be guessed that I have not much pruning to do among this section; in short, it consists more in thinning out weak lateral growths, and as much of the older wood as I can afford to cut away. Having done this, any leaves that may remain will be cut off, and the house still left open for about a fortnight longer.

Now, a word or two about the climbers. These need quite a different style of pruning; but, like the others, almost all of this was done during the growing season. I have climbers on the roof at various intervals—up the pillars, and over the iron ties from roof to roof. The house is on a hill, is 24 feet wide, and ranges from 8 to 12 feet high, so that the strong growers have plenty of room to show their true characteristics and usefulness. In order to do this, they must make plenty of strong wood, and it is absolutely necessary that this be well ripened previous to being started into fresh growth. I have more than once called attention to this point, and its great importance will be realised when I say that almost every one of the well-matured eyes will produce a bloom, whereas upon partially-ripened rods they would barely exceed one in a dozen; a matter of three weeks longer in maturing may make all the difference. As soon as a long rod of growth has opened all its flowers, I begin to remove the wood, not cutting away the whole at once, for I am convinced that this practice is often the precursor of canker, while there cannot be a doubt that it aggravates it. If we give a little thought to the matter, we shall be convinced that the roots must be in a high state of activity to support the enormous quantity of foliage and bloom borne by a climber at this stage. To remove this so suddenly, as some advise, must seriously upset the balance between

root and wood growth. There is no outlet for the large quantities of water which the roots are absorbing, and consequently they cease activity to a great extent. I have more than once taken the trouble to examine the roots of plants treated in this manner, and have found the points of the roots dead, giving me the idea that they stopped growth suddenly and prematurely. By removing the useless wood in two or three cuttings we avoid this, and the plant continues in health and activity, and more strength is gradually diverted to those strong shoots which invariably break from the base of the older ones, or from the crown of the plant. As we are so dependent upon these for a good crop the following season, we at once see how essential it is to converge all of the plant's strength and energy into this point. Unless these are encouraged early, they cannot become properly matured in time for the early forcing I intend my plants to undergo. Plenty of water at the roots, with a thorough soaking of liquid manure once a fortnight, will materially assist towards this end; but all root-watering should cease by the end of August, or the roots will not ripen up satisfactorily.

To hark back again to the present work. Having stopped such rods as may still be inclined to grow, and removed all of their ripe leaves, it will be well to fasten them into their proper places at once. Both the short and long growers will have the surface-soil scratched over, and be left fully exposed to all the light and air possible for a short time longer. My pot Roses, which I intend bringing into the same house, were looked over and repotted a few weeks ago; they are now beginning to push into new growth, and will be housed about the middle of next month. At the same time as this is done, the borders will be mulched and slightly forked over. One good soaking will be afforded them, but no more until the days have turned. For some time the pot plants can stand among the border Roses, and also upon a low wall which runs all around the centre border. Later on, as they break into growth, a batch will be removed to another house; but for the remainder of this year, one house will be sufficient.

I shall probably commence cutting very soon after the days turn, and they will come on rapidly. By starting them early, and keeping them just on the move, we gain such a great advantage; and with a slight increase in the temperature, added to the remarkable influence the turn of days has upon all plant life, this house will soon be full of bloom. An even temperature of 45° to 50° up to the end of the year will be aimed at; after this it will gradually rise to 65° and 70°. One of the most important things is to keep the plants free from insects, and if a good syringing or two be given with some insecticide of almost double the advertised strength, now that the wood is carrying no young foliage, insects will not attack them so freely. Syringing during the winter must be done with judgment, clear days being chosen as much as possible. I prefer a slight fumigation to syringing at this time, and it will pay to do this promptly. It is the first few insects which stock the house, and do so much mischief. *A. P.*

INTERNATIONAL JUBILEE HORTICULTURAL SHOW AT LEIPZIG.

THE anniversary of the fifty years' existence of the Leipzig Gardeners' Society was celebrated this year with a great horticultural exhibition, lasting from August 25 to September 5. It was anticipated that the exhibition would be a large one, and extensive preparations were made; moreover, the announcements made by the Society led to great things being expected. Unfortunately, the weather proved very unfavourable, with the result of a small attendance of visitors. Then, the large hall, in which the warm-house plants were placed, was destitute of windows, and was roofed over with semi-transparent linen, making it a not very suitable place either for the plants for so long a period, or for

the visitor; and so dark was it, that it was impossible to obtain a favourable view of all the plants.

The exhibition, in point of extent, exceeded all previous ones held in Germany, and many had wished, says the *Handelsblatt für den Deutschen Gartenbau*, that one-third less space had been occupied by exhibits.

Considerable blame is attached to those inevitable scapegoats at horticultural shows—the judges; and the show authorities come in for a share; for the bad way in which exhibits were placed, rendering the judges' work very difficult. This consisted of the indiscriminate mixing up of exhibits which should have been grouped for the purpose of comparison. This error on the part of the show authorities is not confined to Germany, as many of our readers can testify. Moreover, the judges were provided with no one who was acquainted with the various groups of exhibits to serve them as a guide to the various objects; consequently, much time was lost. The remarks of the editor of the above-named journal as regards arrangements at these big shows is very pertinent. He says that when tasteful or landscape-like effects are desirable, or must be carried out, plants and objects of one kind should be placed in juxtaposition as much as possible, for the sake of comparison, and not be too much subjected to the general arrangement.

The show was (in so far as the foreigner took but little part in it, although it was a so-called international) a triumph for the home gardener; and instead of being a German, it was in reality a Leipzig exhibition, and that without inflicting any injury to it.

Great praise was due to Messrs. Hanisch, M. Jacob, Otto Mann, Otto Thalacker, and Albert Wagner for their efforts in giving to the event a decided stamp of magnificence.

FRUIT REGISTER.

PEAR JARGONELLE.

OF all the varieties of Pears I think there is none so peculiar in its likes and dislikes of soil as the Jargonelle. In this garden, where the soil is heavy and retentive, and consequently cold during the winter and spring, it will barely exist when planted in the open, whether as a bush, pyramid, or as a standard. For ten years we never gathered half-a-dozen Pears from trees in such a position; yet against a wall we manage fairly well. It was a great surprise to me therefore, then to see the half-standard trees growing in Mr. R. Dean's garden at Ealing, wreathed as were the branches from end to end with fruit, not large certainly, but free from spot and blemish of any kind. The smallness of the fruit was owing to the quantity upon the trees, coupled with the long spell of drought, anterior to my visit in the middle of July. The soil there is a light sandy loam, and evidently especially suited to the requirements of this Pear. Another peculiar feature of this variety is its bad selling properties, especially when Williams' Bon Chrétien can be obtained. In many places there is really no sale for Jargonelles in the presence of "Williams'." There are plenty of persons, though, who would prefer the former to the latter when caught at the right moment. *E. Molyneux.*

FLORISTS' FLOWERS.

NEW VARIETIES OF DAHLIAS.

BOTH at the National Dahlia Show at the Crystal Palace, and again at the Royal Aquarium Exhibition, new varieties of Dahlias were produced in large numbers, especially of the true Cactus type. Thanks to raisers, the Cactus Dahlias are following the form of *D. Juarezi*, but in not a few instances, quite novel and attractive colours, after the character of Mr. Ware's beautiful variety *Delicata*, which it is sup-

posed originated as a seedling from Mrs. Hawkins. The decorative Dahlias so-called, which in many instances are but a reproduction of what our forefathers rejected many years ago, are losing ground, and it is only varieties of a distinct and attractive character which will be found able to compete with the true Cactus forms. The National Dahlia Society have found it expedient to have a class for true Cactus Dahlias from which the decorative varieties are rigidly excluded.

Of new show and fancy Dahlias but very few have so far put in appearance. At the Agricultural Hall Show, Mr. Mortimer, of Farnham, received an Award of Merit for Mrs. Mortimer, the ground deep bright gold, the petals tipped with white and suffused with pink, deepening on some of the petals to orange-brown, a very distinct and pleasing variety that might probably be shown either as a show or a fancy type. Two other promising flowers are Niobe (Keynes, Williams & Co.), shaded crimson, paling to bright crimson on the petal edges; and Cherub (Harris), of much the same colour as a flower which bore this name thirty years ago, buff, shaded with cerise and orange in centre, very pleasing, small as shown—but Mr. Harris never grows his seedlings to large size. Mr. Mortimer has a fancy named *S. Mortimer*, having a pale pinkish-rose ground striped and flaked with crimson, which is likely to be a useful variety from the exhibitor's point of view. Of true Cactus varieties, Mr. Ware has introduced a white variety named Mrs. A. Peart, creamy-white, with a bright yellow centre, very distinct and good (Certificate of Merit). There are several white decorative varieties in cultivation, but nothing possessing the true Cactus character found in Mrs. Peart. From Messrs. Keynes & Co., have come *Lady Penzance*, beautiful soft yellow; *Lady Henry Grosvenor*, delicate salmon base, and bright yellow centre, a decided improvement upon two or three varieties of the same colour; and *Chancellor*, wine-crimson, flushed with purple upon the basal petals, very fine and distinct. To all three Certificates of Merit have been awarded. *Gloriosa* (Keynes), a large deep bright scarlet variety, which received an Award of Merit at the Agricultural Hall, missed it at the Crystal Palace through being too coarse. *Ernest Cheal* (Cheal & Sons), deep bright scarlet, gained the same award at Islington, but failed to do so at Sydenham through being out of condition. *Matchless* (Perkins & Sons), is a very fine dark variety, the colour maroon, paling to crimson on the petal tips, a true Cactus; and *Purple Prince*, from the same raisers, maroon centre, the base of the petals tipped with bright purplish-crimson; both awarded Certificates of Merit. *Beauty of Wilts* (Pictor), bright orange-salmon, very distinct and pleasing; *Mary Hillier* (J. T. West), pale bright orange-red, fine shape; *Ethel* (J. T. West), the base bright salmon, flushed with deep orange shading to scarlet, very fine; and *Florence Keith* (J. T. West), pale yellow base, edged with deep orange, very distinct and novel, all received Certificates of Merit. *Lilacina* (Cannell), pale yellow ground, deeply suffused with bright purplish-mauve, especially on the petal tips, is a decorative variety, but certificated because so distinct and novel.

So far a few very fine additions have been made to the Pompon varieties, such as *Captain Boyton* (C. Turner), rich shining maroon, fine shape, medium size; *Rowena* (C. Turner), yellow ground, heavily tipped with bright pale red; *Irene* (C. Turner), white, the base of the petals rosy, and side edgings of bright crimson; and *Eric* (C. Turner), white, with the side margins of deep bright maroon-crimson, all received Certificates of Merit; and the same award was made to *Ceres* (Keynes & Co.), pale yellow; *Little Julia* (J. T. West), bright red, of very fine shape; and *Pomponal* (Cheal & Sons), sulphur base, slightly tipped with the palest rosy-purple.

Some very distinct single Dahlias were shown both at the Crystal Palace and Royal Aquarium, and awarded Certificates of Merit, viz., *Scarlet Perfection*, brilliant scarlet, of the finest shape; and *Queen of Beauties*, orange-scarlet, with an orange tip to each petal, from Messrs. Perkins & Sons; *May Sharpe*, buff, flaked with orange-red and scarlet; and

Mrs. Harris, blush, with side edgings of bright rosy-purple, from Messrs. Cheal & Sons; and The Demon, rich shining maroon; Phyllis, flushed with lilac and flaked with crimson on a pale ground; M. C. C., yellow, striped and flaked with orange-red; and Tommy, yellow, flaked with bright crimson, all from Mr. T. W. Girdlestone. R. D.

SINGLE DAHLIA PARAGON.

I see that Messrs. Keynes, Williams & Co., in their catalogue of Dahlias, give Mr. H. Cannell the credit of having been the raiser of this well-known single variety. As I have in my possession a Dahlia catalogue issued in 1832 which contains this variety, and the only single flower in the list, while its description tallies exactly with what is grown in the present day. Illustrations as Mr. Cannell undoubtedly is as a florist, I can scarcely imagine that he was a raiser

VEGETABLE PRODUCTS IN CHINA.

SOME curiosities of the rise and fall of certain commercial vegetable products may be gathered from a report on the trade of Pakhoi for the year 1892. In some remarks on the export of essential oils the most noticeable developments are said to have been made in Star Anise and Cassia, the former from *Illicium verum* and the latter from *Cinnamomum cassia*. The advance in the value of Anise oil was from £15,185 in 1891 to £35,579 in 1892, and in Cassia oil from £13,074 in 1891 to £41,408 in 1892. Chinese traders, who alone have any knowledge of the trade in Star Anise and essential oils, assert that this extraordinary increase is due solely to increased production, and further state that every alternate year there is a large increase in the trade. This

advanced considerably. This commodity is the refuse of the ground-nuts (*Arachis hypogæa*), after the oil has been extracted, and it is pressed into cake and used chiefly as a fertiliser in China, for which purpose it is said to be admirably suited, and it is interesting to note that enquiries have been made from Europe with a view to its introduction for the same purpose. Its cost if purchased in Pakhoi, according to the value as stated in the customs returns, would be about £3 12s. per ton, which with freight, &c., to Europe would make its cost considerable.

SPIRÆA BUMALDA, "ANTHONY WATERER."

WITH a perseverance as admirable in its way, as the shrub is in another, Mr. Waterer has exhibited this charming little plant at several of the exhibitions this season. It is of dwarf habit, and its flowers are of a very rich deep rose colour. It is this depth of colour which gives to *Spiræa Anthony Waterer* its distinctive character. For rockeries, the front of shrubberies, or for massing in beds, this little plant will be found most desirable. *S. Bumalda* is of Japanese origin, and is probably a form of *S. japonica*, *alias callosa*, *alias Fortunei*.

DECIDUOUS FERNS.

So many deciduous Ferns fail in late autumn and during the winter through lack of comprehension on the part of their owners of their peculiarity of dying down, that a few lines of warning may be of service. Quite recently we were consulted by a friend, to whom we had given a few British Ferns, and who was much concerned to find that several, notwithstanding the greatest care, were getting shabbier and shabbier, and, as he put it, "dying by inches," whereas they were no more dying than the trees were dying which were shedding their leaves in showers all around us. The phenomenon, in fact, is precisely the same in both cases, the only difference being that as every frond of a Fern springs from the roots, its disappearance with its fellows involves the disappearance altogether of the plants, while in the deciduous trees the trunk and branches remain to attest their continued existence.

Among tropical Ferns, owing to the equability of the seasons, by far the greater part of the species are evergreen, but in the temperate zones a large proportion lose their fronds entirely in the winter, some even, such as *Cystopteris montana*, withering down without any apparent reason in August. Most of the deciduous species, however, continue to grow until the temperature falls so low as to check them, growth then somewhat suddenly ceases. The sap appears to be withdrawn into the crown or rhizome, which swells up and forms the incipient fronds of the next season, either in a clump in those of caespitose habit, or in nodules upon the rhizomes in the case of the creeping ones.

The fronds then change colour, often assuming brilliant tints of orange and yellow, shrivel, fall, and rot away, finally disappearing entirely. That the sap is absorbed by the crown is clearly evidenced by the fact that, if the fronds be cut immediately they begin to turn, the cut fronds will remain as they were for some time, while those left will shrivel rapidly, and eventually become quite thin; furthermore, so long as any sap remains, no matter how dilapidated the frond may appear, a strong leading vein will be found to persist attaching it to the crown. This being the case, it is obvious that the fading fronds should not be removed until they are quite brown and shrivelled, as otherwise the next season's growth is likely to be impaired, and the vitality of the crown, and its consequent ability to withstand the rigours of the winter, are also to a certain extent diminished.

In outdoor ferneries, therefore, it does not do to be over neat when the plants become, as they inevitably do, somewhat unsightly in the fall of the year

FIG. 37.—SPIRÆA BUMALDA, "ANTHONY WATERER." DWARF HARDY SHRUB, FLOWERS DEEP ROSE.

of Dahlias sixty-one years ago. That the credit of re-introducing it is his I gladly admit; and I can go a step further and say, that when Paragon is caught at its best, as Messrs. Cheal & Sons sometimes show it, it is in the foremost rank of the single varieties. It has such a marked individuality of character, that this fact accounts for its being the only single variety included in the catalogue above mentioned; but the year of its actual first appearance is probably unknown. I can quite understand that its distinct marking caused it to be grown through so many years, till it was re-introduced by Mr. Cannell. There were two double Paragons in cultivation during the thirties, one was *Brewer's*, described as a dazzling scarlet; the other *Wells*, primrose; but neither of these is to be confounded with the single Paragon. It would be interesting if Mr. H. Cannell would inform us where he succeeded in finding Paragon, and so was enabled to re-introduce it. R. D.

latter statement, however, is only partially verified by the customs returns for past years in the case of Star Anise, and not at all in the case of essential oils. The Consul gives it as his opinion that the increase, in part at any rate, is to be accounted for by a change of route—that whereas in past years these goods have been sent in native boats to Macao by the West River, last year, possibly owing to increased taxation by that route, the trade has been diverted to Pakhoi. The essential oils of Anise and Cassia are mainly destined for export to Europe, where the demand, stimulated no doubt by the heavy fall in silver, has greatly increased. Enquiries have been made by European firms with a view to purchasing the oils in Pakhoi, but the trade is entirely in the hands of the Macao merchants established at Pakhoi, who prefer to send them to Macao before sale to foreigners and shipment to Europe, and it seems improbable that they will ever be purchased at profitable rates or indeed at all in Pakhoi. Ground-nut cake has also

and even when the fronds are dead and removable, it must not be forgotten that in a state of nature, they serve as a loose covering, and consequent protection, to their own crowns and those of their neighbours. When, therefore, for order's sake, they are cleared away, similar protection should be afforded by a mulching of leaves, to serve at once as some protection against extreme frost and also against drought, which in dry frosty weather with keen easterly winds, has also to be guarded against.

With Ferns in pots under cover the same principles must be kept in view, and decidedly the best plan with the hardy deciduous varieties, is to sink the pots in the soil in some sheltered part of the garden, so soon as the decay of the fronds renders them unsightly.

The chief risk of deciduous Ferns in pots, viz., drought though forgetfulness is thus avoided. In the course of four or five months during which they are invisible, they are almost certain to be neglected, or it may be considered that in their dormant state they are like bulbs and need no attention, but this is by no means the case. If during the winter we visit the Ferns in their congenial homes, we shall find them absolutely soaking in the wet leaf-mould in which most of them will not only be embedded but actually covered. In the winter too, though apparently dormant, they are not altogether so for the greater part of the time, since long before the fronds actually rise, the crowns may be observed to fatten up and swell, while if a plant be lifted, the root-points will manifestly be active. If, therefore, pot plants be allowed to get dust dry, it is clear that these active roots will be killed and instead of crowns fattening up to burst into verdancy like a fountain when the spring comes, there is simply a blank in the collection, and a look to suit it upon the ere-while owner's face, who will then probably insist upon it that it died in the autumn.

Among our native British species the truly deciduous ones are the Lady Fern (*Athyrium filix-fœmina*), and its relative, the Mountain Lady Fern (*P. alpestre*), all the species of Bladder Fern (*Cystopteris*), even the so-called *C. sempervirens* only maintaining its fronds a little longer than its relatives; the Oak Fern (*Polypodium Dryopteris*), Beech Fern (*P. Phegopteris*), Limestone Polypody (*P. calcareum*), the Royal Fern (*Osmunda regalis*), the Woodsias (*W. ilvensis* and *W. hyperborea*), the Moonwort (*Botrychium lunaria*), Adder's Tongue (*Ophioglossum vulgatum*), the Mountain Buckler Fern (*Lastrea montana*), the Marsh Buckler Fern (*L. Thelypteris*), the intermediate Male Fern (*L. propinqua*), the common Bracken (*Pteris aquilina*), and the Parsley Fern (*Allosorus crispus*). All these, even if grown under glass, under quite warm conditions, disappear altogether, so far as fronds are concerned, in the autumn. Nature, however, has no bard and fast lines, and consequently we have species which, though still deciduous under natural conditions, occupy an intermediate place by managing to retain their fronds through the winter under shelter. These are the soft Male Fern (*L. filix-mas*), the Broad Buckler Fern (*L. dilatata*), and its close ally, *L. spinulosa*. These seem only to lose their fronds by stress of weather, and not by the sudden reflux of vital energy which characterises the truly deciduous species previously named. On the other hand, such species as the Shield Ferns, viz., the Holly Fern (*Polystichum Lonchitis*), and the hard and soft Shield Ferns (*P. aculeatum* and *P. unguilare*), the Hard Male Fern (*L. pseudo-mas*), the Hard Fern (*Blechnum spicant*), the Hart's-tongue (*Scolopendrium vulgare*), the Common Polypody (*P. vulgare*), and all the Spleenworts (*Asplenium*), are perfectly evergreen, maintaining their foliage well into the following season, and being thus, under shelter, well adapted for winter decoration. The deciduous Ferns, however, though useless in this respect, make up for their winter invisibility by such a sudden outburst of delicate verdure in the spring, altogether unhampered by the presence of old fronds, as in the opinion of many amply compensates for the drawback. Their growth is also more rapid, and hence, while more of the

deciduous species are in full form early in June, the evergreen ones require another month, some even, such as the common Polypody, not being fully developed before August or September.

In collections under glass, the end of the year is a good time for a general readjustment, and in forming them, it is well to bear the proportion of deciduous and evergreen species in mind, as by so doing, the winter fernery may lack but little in attractiveness as compared with that of the summer since, though fewer in number, the evergreen plants, having more elbow-room, are fully capable of affording a fine contrast by their verdure to the frosty and snowy condition of things out-of-doors.

The same remarks apply to such hardy exotic deciduous species as the Canadian Maidenhair (*A. pedatum*) and the Ostrich Feather Ferns (*Struthiopteris germanica* and *S. pennsylvanica*). These, like the British ones, can be sunk in the soil, and will, when taken up, overhauled, and reinstated in the spring, very speedily send up their verdant plumes to gladden the eye that can appreciate delicacy of form, coupled with that gamut of greens which constitutes so great a proportion of the harmony of vernal nature, and such an agreeable foil to the brighter hues of the floral wealth of summer.

A curious feature which we have observed in connection with some deciduous Ferns is, that their period of rest seems determined less by the seasonal peculiarities of the place where they are grown, than those of their place of origin. We have, for instance, varieties of the Lady Fern found in Devonshire and in Scotland, the latter of which though domiciled in Essex for ten or twelve years, rise constantly about a fortnight later than the south country ones grown side by side with them, the deterrent effect of the longer Scotch winter seeming to be permanently impressed upon the species. It would be interesting to know if this be generally the case, as it touches upon the question of heredity of acquired characters. We have also a splendid variety of *L. dilatata*, found in the Azores, which has quite lost its semi-deciduous nature, being perfectly evergreen, though frequently frozen. *Chas. T. Drury, F.L.S., Fernholme, Crest Gate, Essex.*

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By M. TEMPLE, Gardener, Carron House, Falkirk, N.B.

THE PINERY.—Pine plants to show fruit at the beginning of the year should now be in a well-rooted condition, the roots filling every part of the ball; and those to be selected for the purpose indicated should be placed where they can receive special treatment. These future fruiters should not suffer from lack of water at the roots, nor should the soil be constantly kept very moist, enough clean soft water being afforded to keep the plants in health. Some growers of Pines force plants into fruit by drying the soil till injury is done by it and an arid atmosphere in the house. The result of this kind of treatment is fruit of small size and of inferior quality. The temperature need not rise above 65° at night, and there should be a gradual decrease of heat as the season advances, in order to rest the plants. Those which are to show fruit some months later than the foregoing, should have a healthy growing atmosphere maintained about them, air being admitted early in the day. Where stable manure is employed to furnish heat, more air will be required in the house than if hot water were employed. When the sun is powerful the use of artificial heat should be dispensed with as much as can be done with safety, remembering also that a high temperature in dull, sunless weather is ruinous to young plants.

PEACHES AND NECTARINES.—Those trees which fruited in May will now be losing their leaves. A good shake of the wires to which trees are trained, or the same applied to standard trees, will cause many leaves to fall; but forcing the leaves from the branches when they are still doing good service is weakening to the trees. All lateral growths should be kept cut off, and attention given to thinning out the old wood which produced the crop of the past year. Sun and air should be allowed to have full

access to the trees and borders, and the surface of the latter should be freed from mulching. Borders inside the houses which are well drained may require water, and need weekly examination with a probe stick, for they should at no time be allowed to become dry; on the contrary, a sodden soil prevents the ripening of the fruit-buds.

MELONS.—When fruit is ripening it should be well exposed to the sun, and as much air afforded as can be, and no more moisture supplied at the roots than will keep the foliage and roots healthy; all syringing of the leaves should now cease, except where young fruits are swelling, and only then when weather is sunny. It is a great point in Melon growing at any season to maintain healthy foliage to the last. The reason why we find so many fine-looking Melons at exhibitions, with perfume strong and tempting, and the flavour of the worst description, is due to the fruit having been ripened on plants destitute of healthy foliage, and often after the roots have been destroyed by a too liberal use of liquid manure. Late crops now setting should have close attention in fertilising the strongest and best-placed blooms. In pits the fruits should be elevated, resting on bricks or tiles. Our late crops in pots have set a crop without much trouble, careful watering and airing being important items of management.

THE KITCHEN GARDEN.

By H. C. PRINSEP, Gardener, Buxted Park, Uckfield.

FRENCH OR KIDNEY BEANS.—As these are so much in request during the winter, preparations should now be made for furnishing a continuous supply. Those gardeners who have some artificially-heated pits will have no difficulty in this matter. Failing suitable pits, the Beans can be grown in houses with other plants, but it does not make their cultivation easy if the latter require a different kind of treatment. Beans sown in heated pits at this season should afford a supply of pods during the early part of the month of December; and if precautions have been taken to sow some seed in a pit or cold frame, these should supply the table till those sown in heated pits are ready for use. The pods of Runner Beans as they become ready should be gathered for fear frost should destroy them and the plants. The pods can be kept in a fresh state for a week or two in a cool, dark cellar; and the pods left on the plants will grow rapidly when the others are gathered. French Beans in bearing should be covered up securely at night if frost is imminent, and lights may be placed over those plants that are just come through the soil.

ASPARAGUS.—Plants on beds set apart for forcing, will have completed their growth, and any roots required for forcing at an early date should have all top-growth removed, as the longer the period of rest thus induced, the more readily will they respond to the forcing.

AUTUMN ONIONS.—If these are not planted at once, the operation had better be deferred till April, for unless the roots take a good hold of the soil before frost sets in, they will be lifted out of it and destroyed. Growth in those Onions that were transplanted earlier should be encouraged, so that they may soon become established.

VEGETABLE MARROWS.—Like French Beans, these succumb to the first touch of frost, and precaution must be taken to cover them at night when there are signs of frost. After bright days, with the wind in the north, sudden frosts will occur at night, and it is well to be on the safe side. If a slight covering of bracken or other litter be thrown over the plants, it will suffice to ward off several degrees of frost, and in that way the supply may be prolonged for a few weeks longer. All Marrows should be cut when of usable size, preserving them in a cool place.

PEAS.—Those sown in beds in brick pits for a late supply must be closely watched for mildew, as, if it should much increase, it will be of no avail to try to get a crop. See that the plants do not suffer from want of water, as this has a tendency to induce mildew. The glass lights should be put on at night and tilted at the back, removing them in the early morning, so that the plants may be kept starchy.

STORE-ROOM.—All roots, including Potatoes, should be examined at frequent intervals, and decaying roots removed. Shallots must be kept cool and dry, or they will start into growth; the

same may be said of Onions, which will keep sound longer if kept cool. Preparations should be made on wet days for storing the roots of Salsafy, Scorzonera, Carrots, and Beet, as the time will soon arrive when it will be necessary to take them out of the ground.

THE ORCHID HOUSES.

By W. HOLMES, Gardener, Pickering Lodge, Timperley.

CATTLEYS.—*Cattleya Bowringiana* is one of those useful species which come into flower during the latter part of October, and the gardener who has a good stock of the plants, if he places them in different parts of the *Cattleya*-house, may have flowers till December. *C. Bowringiana* is about finishing its new growths, and should be watered carefully, as it will start anew if too much water be afforded. Let, therefore, the peat and live sphagnum moss get quite dry before affording water. The plant will bear much light without the leaves being injured, but a glaring sun on an air-bubble in the glass will soon disfigure the leaves.

INTERMEDIATE HOUSE.—*Cœlogyne cristata*, *Cymbidium eburneum*, *C. affine*, *C. Mastersii*, *C. Lowianum*, *C. L. concolor*, *Sobralia macrantha*, *S. xantholeuca*, *S. x. alba*, *S. leucoxantha*, are plants which do very well with the *Cattleyas*; and those which are well established may have liberal supplies of weak manure-water given them, especially *Cœlogyne*s, these being now engaged in perfecting their new growths, and they promise to be fine this year. *Cœlogyne cristata alba* and the *Trentham* variety of *cristata* make longer rhizomes than the others, and it is good practice to keep them pegged round the sides of the pots whilst growing, so as to encourage rooting in the potting materials, instead of their going outside the pots. Pseudobulbs are much finer when roots are pushed into the former. By this date shading will be less needed than formerly—in fact, those on the north side of houses may be dried and rolled up under the pent-house, or stowed away. The blinds on the south or sunny side of the house may remain in place for a short time longer, bright sun doing a good deal of mischief in a short time even at this season. On very bright days let the houses be well damped down, and well ventilated, all the light and sun being afforded that is safe. Species which need more attention in the matter of shading than others are *Phalenopsis*, *Vandas*, *Angraecums*, and some *Cypripediums*, and the blinds should be run down over these on very bright mornings. When any *Cattleya* or *Dendrobium* has completed its growth for the season, see that these are properly hardened off, and then remove them to a drier and more airy house. Remove the plants of *Cattleya* as fast as they finish their new pseudobulbs to that end of the house where there is more light, and the ventilation more abundant, and give but little water at the root. The same kind of treatment should be applied to *Dendrobiums*, removing these plants to a cool earlyinery where the ventilators are constantly open, but so arranging the plants for the present that no cold draughts reach them, water being withheld, but not suddenly. *Thunia Marshalliana* and *T. Bensoniæ* are placed in theinery along with the *Dendrobes*. *Pleiones lagenaria* and *maculata*, now losing their leaves, should not be dried off before flowering is past, when they may be kept slightly drier for a few weeks.

THE HARDY FRUIT GARDEN.

By T. TURTON, Gardener, Maiden Erlegh, Reading.

ROOT-PRUNING APRICOTS.—Trees which may have made very strong growth may be root-pruned with advantage at this season, and the pruning will correct this the first season, but unless the same be repeated every year until they fruit heavily, growth will be as strong as ever, with the result that sooner or later the branches will die off, as is often witnessed. This chiefly happens in districts the natural soil of which is too deep and rich for the Apricot. In such soils satisfactory results can only be obtained by having the roots restricted to borders from 4 feet to 6 feet wide, by building a 4½-inch brick wall up to within 6 inches of the surface of the border. In districts where chalk is readily obtained, a wall may be made of this material in the manner described in one of my earlier Calendars. This mode of restriction has been tried in these gardens with very good results, the trees not making nearly so strong a growth, and the crops are considerably larger than was formerly the case. For Apricots, Peaches, and Nectarines, I prefer to have the borders from 4 feet to 6 feet in width, and confined

in the above manner; and if a brick wall is decided upon, and tiles are used for edging, these can be placed on the top of the wall, and kept in position with a fillet of cement on either side. Apricots are so profitable a crop, and so greatly in demand, that no ordinary expense or labour in bringing them into full bearing should be considered too great. On a suitable formation, like chalk, limestone, or almost any kind of rock which is not more than 2 feet from the surface, these restrictions of wood growth would be unnecessary, and in the event of non-success on such soils, very liberal root-waterings should be afforded at this season to enable the trees to fully develop the flower-buds; and throughout the growing season a good mulching should be laid over the roots.

LATE PLUMS.—At no previous time do I recollect *Coe's Golden Drop Plum* to have ripened so well as this year; and to prolong its season, although the fruit will hang for some time on the trees after it is ripe, they should be gathered when quite dry, and laid in a single layer on the fruit-room shelves, but not plucking them off the stalks, but gathering the fruit with the stalks attached, or decay will soon take place, owing to the rupture of the skin. *Transparent Gage*, another very excellent sort, will also keep well if treated in the same manner. *Belle de Septembre*, a very fine kitchen Plum, which should also be in all good collections, as being so late in an ordinary season, does not ripen till after the wasps have disappeared. The above also applies to *Damsons*, which may be kept after being gathered for several weeks quite fresh, and be a welcome change for tarts.

GENERAL WORK.—Take advantage of dry weather to cut down weeds among bush trees, also Strawberry plantations, and from the latter remove runners, which despite the dry weather the one-year old plants are so persistent in making. Afford old plantations of Strawberries liberal supplies of liquid manure during showery weather. Cut out the old fruiting canes of autumn-bearing Raspberries as soon as they finish giving serviceable fruits, and tie up the young canes in the manner described for the summer-bearing sorts; also remove any late sucker growths from the stools of the summer-bearing sorts.

PLANTS UNDER GLASS.

By B. WADDS, Gardener, Birdsall Gardens, York.

VIOLETS.—Six of the best sweet-scented varieties for flowering in frames or pits during the winter and spring months, are *De Parme*, *Lady Hume Campbell*, *Marie Louise*, *New York*, *Queen of Violets*, *White*, and *The Czar*. Preparations should be made at once for lifting plants that have been grown for the purpose on borders outside. They should be in their winter quarters by the end of the first week in October. For earliest flowers, plant *New York* and *Marie Louise*, in a frame on a spent Cucumber dung-bed facing the south, or make up a bed of rotted dung, 2 feet high at the back, and 1 foot at the front. Place two light frames over this, and fill up the insides with manure to within about 1 foot of the glass, and give it the same slope as the top of frame. The depth of space left for plants must depend on the size of the ball of earth to be taken with the roots; when the plants are in and all is finished, there should be about 4 inches between the leaves of the plants and the glass. The ball of earth with the roots should be placed on the manure, so that the roots touch it at once. Give a space of about 8 inches from plant to plant, and fill up between with old garden-soil. If the plants in their summer quarters were in lines a foot apart, with about 6 or 8 inches between each plant, a man should start at one end of the border, and with a bright spade take out a spit of soil up to about 3 inches of the first row of plants. A sharp cut of the soil between each plant, then 3 inches behind the row, dig out each plant, hand them with the spade to the man with the barrow; if the soil is dry, give a good soaking of water previously. There is not much damage done to the plants in this way, and careful attention to this at the time of lifting is imperative. After the plants are in, give a mulching of old horse-dung passed through a coarse sieve, and then a thorough soaking of water three times over; and if troubled with mould, spread half an inch of small charcoal all over the bed. Treated in this way the plants do not feel the shift, and continue flowering. *De Parme*, *Lady Hume Campbell*, *Queen*, and *The Czar*, require the same care. They are not so early in flowering, and they do well in span or lean-to pits without any further protection

than the glass affords. Give abundance of air night and day during fine weather, and keep close during severe frosts; those on the dung-beds, too, should be well protected from frost, and if the weather is very bright after planting, and there are any signs of the plants flagging, give them some slight shade. It is a good plan to put some plants of each sort into pots and boxes, they often come in useful during bad weather, when the frames cannot be opened; place them in a cool-house, where there is no fire-heat. Boxes 2 or 3 feet long, 9 inches wide, and 9 deep, will hold two rows of plants, and are handy for moving about; they should be well-drained, and some good rotted manure placed over the drainage. Or they do very well in pots, if kept kept from fire-heat, and good attention paid to watering, with plenty of light, and a free circulation of air at all times.

THE FLOWER GARDEN.

By T. H. CRASP.

PROPAGATION OF PLANTS.—One of the most pressing matters at this season is the completion of the propagation of all kinds of plants raised from cuttings needed for bedding-out another year. In addition to doing this, it is advisable, at the end of the month, to lift a few plants of each kind of *Pelargonium*, and to pot them in as small pots as they will go, and place them on a shelf of a dry house of some kind, watering them sparingly now and during the winter. In the spring these old plants will usually produce abundance of cuttings. We may now expect slight frosts in the less warm parts of the country, and any tender plants which it is intended to winter should be potted-up and placed in safe quarters.

CARNATIONS, PICOTEEES, AND PINKS.—The layers or cuttings of these, being rooted, may be planted where they are to bloom. If beds are employed, it is advisable to raise them slightly, say, 3 or 4 inches above the surrounding ground, and in most cases fresh loam, decayed manure, or road-grit will be found useful additions to the soil. The layers should be carefully cut from the mother plant, and as much soil preserved about the roots as possible; and still more care should be taken with plants struck from cuttings. Carnations and Picotees may be planted at about 12 inches apart each way, and the Pinks a trifle nearer together. It is good practice to pot-up some of each kind and variety, standing them in a cold frame for the winter—they are of use in filling up gaps in the beds in the spring.

HERBACEOUS BORDERS should be tidied up, all spent flowers and old stems, &c., being removed, and if seed is required of any plant, no time should be lost in securing it, gathering the seed-vessels as soon as the seeds are found to be fairly matured. Let the seed-vessels thoroughly ripen on shelves in a dry house before cleaning and storing the seed. Most of the ornamental grasses and *Illichrysums*, &c., should have been cut and dried some time since, for if this job is delayed till the seed is ripe, many of them would be valueless. All late-flowering species of everlastings should now be cut, tied up in bunches, and hung up in ainery or dry house.

BULBS.—All *Daffodils*, *Narcissus*, *Crocus*, *Snowdrops*, *Lilium candidum*, and *Crown Imperials*, should be planted about this time, or as soon as the ground is cleared of summer flowers. *Anemone fulgens* should also be planted for early display; and if the tubers of such things as *Iris reticulata*, and its varieties *I. hispanica* and *I. anglica*, are planted this month, they will succeed much better than if left to a later part of the year. Bare places in borders, if not required for the planting of bulbs, may be sown with *Candytuft*, *Nemophila*, *Collinsia*, *Limnanthes Douglasii*, and other hardy annuals.

STAMP COLLECTING.—We have received the July special issue of *STANLEY GIBSON'S Monthly Journal*. The mere fact of the existence of this magazine, which is entirely devoted to matters connected with foreign postage stamps, shows how the fashion for collecting these has increased of late years, and what a business it has become, and how much laborious trifling has been superadded to what was of a more wholesome character. The issue before us has many illustrations, and these, as well as the letterpress, should interest general readers, as well as those for whom they are specially intended.

EDITORIAL NOTICES.

LETTERS FOR PUBLICATION.—All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for contributions, or to return unused communications, or illustrations, unless by special arrangement.

NEWSPAPERS.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

Advertisements should be sent to the PUBLISHER.

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

TUESDAY, SEPT. 26. Royal Horticultural Society: Floral and Fruit Committees, at the Drill Hall, James St., Westminster.

SHOWS.

WEDNESDAY, SEPT. 27. Show of Hardy Fruit, &c., at the Gardening and Forestry Exhibition, Earl's Court (Three days). Gloucester and Cheltenham Horticultural Society (Two days).

SALES.

MONDAY, SEPT. 25. Dutch Bulbs, at Protheroe & Morris' Rooms. Plants, at Protheroe & Morris' Rooms. Large Importations of Dutch Bulbs, at Stevens' Rooms. Orchids, Ferns, Store and Greenhouse Plants, at Ham Green, near Clifton, Bristol, by Alexander, Daniel, Selfe & Co.

TUESDAY, SEPT. 26. Important Unreserved Sale of Established Orchids, and Store and Greenhouse Plants, by order of the Executors of Stephenson Clarke, Esq., deceased, by Protheroe & Morris (three days). Dutch Bulbs, at Protheroe & Morris' Rooms. Large Importations of Dutch Bulbs, at Stevens' Rooms.

WEDNESDAY, SEPT. 27. Dutch Bulbs, at Protheroe & Morris' Rooms. Annual Unreserved Clearance Sale of Greenhouse and other Plants at The Floral Nursery, Maidenhead, by order of Mr. R. Owen, by Protheroe & Morris. Large Importations of Dutch Bulbs, at Stevens' Rooms.

THURSDAY, SEPT. 28. Plants, at Protheroe & Morris' Rooms. Bulbs, at Protheroe & Morris' Rooms. Large Importations of Dutch Bulbs, at Stevens' Rooms.

FRIDAY, SEPT. 29. Bulbs, at Protheroe & Morris' Rooms. Orchids from Mr. F. Sander, at Protheroe & Morris' Rooms.

SATURDAY, SEPT. 30. Dutch Bulbs, at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK—55°·7.

Technical education in gardening. We are all agreed that practical training in a garden, under an experienced master, is the most important factor in the education of a gardener. If to the routine experience thus obtained be added an intelligent knowledge of principles, and the ability to turn it to account in practice, we have an ideally perfect education. This is what is to a great extent carried out at Kew, though, of course, there is no opportunity in that establishment of obtaining information in the culture of fruit and vegetables. This is what is carried out in detail in the Versailles School of Horticulture, in those of Ghent and Vilvorde in Belgium, and in many similar establishments in Germany and America.

An education of the character just mentioned should fit men, if they be otherwise suitably endowed, to rise above the class of garden-labourers and to fill the higher places in the gardening world—to be the directors and teachers

of others, and to command an adequate remuneration. Such an education can only be obtained at a properly-equipped school of horticulture on the one hand, and in a well-ordered garden establishment on the other. Then rises the question whether, assuming the necessity of instruction in the principles of cultivation, that instruction should precede, accompany, or follow the more strictly practical training. A good deal might be said in favour of either plan. We are not prepared to discuss this point now; all that we are for the moment concerned with is the necessity for increasing the knowledge and developing the intelligence of the young gardener, as well as his memory and manual dexterity. We want to teach him to observe and to reflect as well as to work, and thus to enhance the value of his labours, and to put at his disposal resources that practical work by itself would never give him. So that this be accomplished, the manner of doing it is a point of minor importance.

So far we have had in view the class who, beginning early, pass the most receptive part of their lives in the practice of routine gardening. But there is a larger and more varied class whose requirements have to be provided for, and that is the class which constitute the auditory at the lectures which are delivered under the auspices of many of the County Councils. These men, speaking generally, do not aspire to fill the higher ranks of the profession; they have other occupations—they want to know enough to turn their little gardens or their allotments to account, and that is all. For the most part, they are almost entirely ignorant of the practice and quite devoid of knowledge of the principles of gardening or farming. We do not see that any better plan can be adopted in this case than what is now followed. Thorough systematic education is here out of the question. The instruction given must clearly be rudimentary; it must be severely practical, and it must, so far as possible, take the form of practical demonstration. Those lecturers have, as it seems to us, succeeded best who have recognised these facts, and acted on them. The local flower-shows might be utilised in this way with great effect if the judges or some competent person could, as was done at Carshalton, point out to the competitors the reasons why certain exhibits were placed first and others last on the list. Much good could also be effected by the display on such occasions of the particular varieties found by experience to be the most suitable to the locality and to the circumstances of the people.

A third class remains to be spoken of, and that is the lads and lasses in the rural schools. Our hopes of progress and advancement largely centre in them. In all such schools, after the elements common to the education of all are provided for, instruction should be given, so far as circumstances will allow, in the principles and in the practice of cultivation. In this manner the lads on leaving school would be far better suited for the business of life than they now are, and after leaving school they would be in a position to follow up with profit what they had learnt at school by attending the lectures and demonstrations of the County Council lecturers. How much more profit might they not be expected to derive from them, than do the present auditors, who for the most part have had no previous education of the kind. To carry out the school education, we need teachers, men or women who, knowing what are the requirements of their pupils, have ability and knowledge enough to supply them. Amongst others, the Essex County Council has acted on

this view. They have established a normal class for teachers, who are carefully instructed and thoroughly drilled in the principles which underlie all successful cultivation. The method pursued is excellent in that it compels the teacher to instruct himself. He is not merely talked to and shown diagrams and preparations, but he has to make them for himself, to develop his own faculties by himself. A better plan of training teachers it would be hard to find. As to the place of examinations in the scheme of education, and the results already obtained, we may have something to say on another occasion.

DISCHIDIA RAFFLESIANA.—Many of those who learnt their botany from LINDLEY's publications have been interested in the figure and description given of the pitchers of this plant, and in the fine plate in WALLICH's *Plante Asiaticae Rariores*. An opportunity of seeing the plant itself and its curious appendages, was, however, not offered till comparatively recently, when the living plant was introduced to Kew from Java by Dr. TREUB. It is an epiphytal plant, closely allied to *Hoya*, with numerous roots proceeding from its stem, and with fleshy orbicular leaves. The pitchers are borne on short lateral shoots. Their appearance is sufficiently indicated in our illustration (fig. 58). Numerous adventitious roots, not shown in our illustration, rise from the base of the pitcher, and dip into the cavity of the pitcher. The pitcher is a modified leaf, the inner surface corresponding, according to TREUB, to the lower surface of an ordinary leaf. Dr. TREUB considers that the pitchers serve to collect and retain rain-water. BECCARI, however, is of opinion that they act as ant-shelters, and DELPINO advances the opinion that they are insect-traps; but against this view TREUB points out that the roots which branch within the pitcher would afford a ready means of escape. Moreover, there is nothing to show a carnivorous habit in the minute structure of the pitcher. In the June number of the *Annals of Botany*, Dr. SCOTT and Miss SARGANT give a summary of what has been written on the subject from the time of WALLICH to the present day, and add a full account of their own observations on the minute anatomy and morphology of the pitchers. They confirm the statement and opinions of TREUB, as before-mentioned.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the above will take place at the Drill Hall, James Street, Victoria Street, Westminster, on Tuesday, September 26, when prizes will be offered for Gladioli. At 3 o'clock Mr. W. LOGGLEN, gardener, Marston House, Frome, will deliver a lecture on the "Causes of Failure in *Eucharis* Culture."

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed by Mr. G. J. INGRAM, the secretary of the Institution, that an election of pensioners on the funds of this Institution will take place in January next. Intending candidates should therefore send in their applications on or before October 14, after which date they cannot be received. Forms of application and full particulars may be obtained from the secretary, 50, Parliament Street, London, S.W.

HORTICULTURAL COLLEGE, SWANLEY.—The Experiments Committee of the Kent County Council held a meeting at the College on the 7th inst., when Professor F. CHESHIRE gave an account of his visit to some agricultural and horticultural schools in France, illustrated by photographs taken by him. At the Agricultural College at Grignon trials of manures were being made, both in field and pots, and in order to investigate the composition of the water passing through the soil, cement-tanks 3 feet deep have been made, in which the plants are grown, and what is lost by the soil is found out by analysing the water. At the Versailles School of Horticulture instruction is given in the growth of vegetables, fruits, and decorative plants under glass. Here more

Allen

FIG. 58.—DISCHIDIA KAFFLESIANA: A BARE FITCHER-PLANT AT KEW. (SEE P. 368.)

applications for the employment of students on leaving are received than they are able to supply, which proves the efficiency of the school. At Vincennes is a smaller horticultural school. Here the Professor met Mr. GEO. VILLE, the celebrated agricultural chemist. In their experiments on preventing Potato and Vine disease, the copper sulphate is mixed with carbonate of soda instead of lime, as they find this composition admits of a finer state of division than when lime is used; in order to render the solution adhesive, sugar is added in preference to molasses. In the gardens of the Luxembourg, Paris, there is a portion devoted to specimen fruit trees and bushes trained in different styles. Once a week a free public lecture and demonstration are given as to management and pruning. The next meeting is fixed for September 21.

MR. MILNER.—It is proposed to invite this gentleman to a complimentary dinner, in acknowledgment of his services to the Gardening and Forestry Exhibition, on Thursday, September 28. Gentlemen intending to be present should communicate with Mr. KNOWLES, at the Exhibition.

THE HESSIAN FLY.—A very interesting and instructive lecture, by FREDERICK ENOCK, F.L.S., &c., on the Hessian fly was delivered at the Rooms of the Balloon Society at St. James's Hall, Piccadilly, on Friday evening, September 15, Dr. GUTTERIDGE in the chair. The lecture was rendered the more appreciable by the aid of capital illustrations and the oxy-hydrogen lantern. That the fly is doing annually much damage to the Wheat crops of this and other countries, especially the United States of America, was demonstrated by the fact of the greatly-reduced harvest of farms on which the insect is present in large numbers, the lecturer instancing a field in Devonshire in which in the course of three hours he had collected 1400 straws containing the grubs of the fly. The lecturer gave illustrations of the fly, of the grub, and of the chrysalis in their various stages of development; the manner and position in which the fly deposits its eggs, and the mode of its attack on the Wheat-straw. The farmers are, he said, helpless in face of this danger, and knowing nothing of the life-history of the fly, they simply do nothing. The Wheat has the fly, it is an act of Providence, and there is no help for it! The result is that the fields get more and more infested, and the returns go nearly down to *nil*. Various suggestions were made for lessening its numbers, including the breeding of a particular English parasitic insect, "The Blessing," whose eggs are laid in the body of the grub of the Hessian fly, and on which it feeds. The most feasible means, however, seem to be the protection of small insect-feeding birds, burning the stubbles of affected fields, also the chaff and dressings which are separated from the grain in the winnowing machines, instead of throwing the latter on the dung-heap, to still further increase the pest. The discussion which followed the lecture chiefly debated the subject of the destruction of the fly; for none could dispute the gravity of the mischief caused by it.

"CREAM" (of the World's Fact, Fun and Fancy) is the title of a new weekly penny paper, which, under the editorship of Mr. FRANCIS GEORGE HEATH, will shortly appear.

RAMSGATE PUBLIC PARK.—A very pretty park, laid out by Mr. J. CHEAL, of Lowfield Nurseries, Crawley, was opened on Thursday, the 7th inst., by Alderman W. P. BLACKBURN, mayor of the town. The transfer of the property from the trustees of the former owner took place on September 29 last year to the representatives of the ratepayers, but the opening was deferred to the present season. The park, although of small extent, contains several interesting features, and its design and laying-out is most creditable to Mr. CHEAL.

"THE FLORA OF BRITISH INDIA."—This important work is now rapidly approaching completion. Part XIX, just issued, contains the remainder of the enumeration of the Palms by Signor BECCARI and

Sir JOSEPH HOOKER. Pandanads, Typhads, Aroids, and some smaller orders are monographed by Sir JOSEPH; whilst the Cyperaceae are treated of by Mr. C. B. CLARKE, who has made an exhaustive study of the order.

THE VINTAGE.—French papers report that the vintage is already over in many parts of France. During this century the vintage has taken place ten times in the first fortnight of September, seventy times in the second fortnight, nineteen times in the first fortnight in October, and once in the second fortnight of that month. This year the vintage began on the 10th of August, and was general on the 20th.

"SCOTCH PLAID."—Messrs. CANNELL & Co. send us under this name flowers of a double Begonia, the petals of which are rich deep crimson, flaked and spotted with green. The contrast is very beautiful, and we trust Messrs. CANNELL may be able to fix so beautiful a variety. The inner petals are clearly merely anthers in a petaloid form, brilliantly coloured and devoid of pollen.

FERMENT OF THE PINE-APPLE.—Mr. R. H. CHITTENDEN has a paper on this subject in the *Transactions of the Connecticut Academy of Arts and Sciences* (1893, p. 281), cited in the *Pharmaceutical Journal*, from whence we take what follows:—The author states that the ripe Pine-apple contains a very powerful proteid-digesting principle, and that the juice also possesses in a remarkable degree the power of curdling milk. The juice appears to contain three distinct proteids.

FLORAL DISPUTE AT HAWICK.—We condense the following from the *Hawick News* of September 8. In this case, JOHN MARTIN, joiner, Loan, brought an action against JOHN RUTHVEN, Allars Crescent, for £12 in name of damages for having lodged an objection against one of his exhibits with the secretary of the Hawick Working Men's Allotment and Cottage Garden Society, the result being that the prizes, including the medal, which pursuer had won at the show on August 5, were forfeited, and he was expelled from the Society. MARTIN brought a second action against the Society for £12 as damages; and a third action for £2 1s. 6d., being the value of the prizes. The pursuer deposed that RUTHVEN, who was second for the medal, objected to him on the ground of unfair practices, alleging that he had received Pentstemons from Mr. WOOD, Summersfield Nurseries, the night before the show, the inference being that he had exhibited these as his own. He repudiated this accusation. While admitting that he had received Pentstemons from Mr. WOOD, he did not know they were coming, and did not exhibit them as his own. For the defence, JOHN RUTHVEN, defender, deposed that when he lodged the objection he thought from what he had heard that it was a case for inquiry. He had no ill-will to pursuer. The Sheriff, after hearing the evidence, said he did not think it was for him to interfere with the decision of the committee. They had JOHN WOOD's statement that he offered to send these Pentstemons to the pursuer, thinking they might be of some use to him for the show, evidently intending they should be shown if he wanted them. It was a dishonest suggestion on Wood's part, and he was sorry that MARTIN did not at once scout the idea of having anything to do with them, but he neither answered yes nor no. From the way he spoke to the boy FISHER, it was evident he expected these flowers, and there was no doubt he was annoyed when the flowers came in a rather withered state. He thought it would be very injudicious and wrong of him to interfere with the committee's decision. In the first case he assailed defender with 5s. expenses. In the second case he granted 3s. expenses to each of the nine witnesses, and 5s. to the agent.

IMPROVING THE QUALITY OF FRUITS.—Nothing is more common, in conventions of fruit growers, than to hear one man say of a certain variety, that it is tasteless and worthless, while the following speaker may laud that variety as one of the highest flavour and best quality. The truth is, that ripening fruit is

an art, which is only to be learned by intelligent experience. Some kinds of fruit require to be gathered a little before ripe, in order to produce the highest flavour, while others require to be dead ripe on the trees before they are gathered. Again, to get the best quality some require to be ripened in a dark and cool place, while others require a warmer and lighter situation. All this has to be learnt by experience, and one of the pleasures of amateur gardening is to study these points, with the view of the production of the best class of fruit. *Meacham's Monthly for September.*

NATURAL VARIATION.—The accumulation and persistence of variations, perhaps originally very slight, result in the establishment of what we find it convenient to describe as a species. From this point of view, a specimen sent us by Mr. WOLLEY DOD is very interesting. It is a Campanula in which not only have the petals retained their primitive isolation, so that the corolla consists of five distinct petals, but the leaves are linear, like the petals, instead of being broadly ovate as they are habitually. It is difficult to form an opinion whether the change in question is indicative of the potential formation of a new species, or of a reversion and retrogression to ancestral characteristics. Does Mr. Dod's specimen represent a step forwards, an arrest, or a reversion? For ourselves we incline to the latter view, but Mr. Dod shall speak for himself:—"I send a specimen of a constantly recurring form of Campanula lactiflora. It is liable to come from seed of any individual of the typical form, about one (or less) per cent. coming from all the seed I raise, as well as from self-sown seed, and I daresay I can find twenty plants of the form in different parts of my garden. It is as long-lived and as healthy as the type, but not so robust. It is curious how the form of leaf corresponds with the form of flower. I have observed the same indication by leaf in other garden plants. A similar form in *C. rotundifolia* seems connected with a double corolla, i.e., seed from the double *C. rotundifolia* always gives some stellate-flowered forms like that which I enclose, and which I have long cultivated."

ONION SHOW AT BANBURY.—The Onion was considerably to the fore at Banbury on the 14th inst., when the annual exhibition of the esculent, instituted by Mr. HENRY DEVERILL, was held in his seed shop, a portion of the roadway outside also being utilised for the purpose. If the bulbs staged for competition were not quite so large as those of last year, they were characterised by colour, solidity, and finish, and there is every probability that Onions, large or small, will keep well during the autumn and winter. The best six of any one of Mr. DEVERILL'S Pedigree Onions was the Lord Keeper, weighing 15 lb., shown by Mr. T. WILKINS, The Gardens, Inwood House, Blandford, a Gold Cup or Medal being the prize. An extra prize was awarded to Mr. R. LYE, The Gardens, Sydmonton Court, Newbury, for six bulbs of Ailsa Craig, weighing 13½ lb.; there were nine competitors. There were sixteen competitors in the class for twelve specimens of Ailsa Craig, Advancer, Cocoa-nut, or Excelsior. Here Mr. Wilkins was 1st, with Ailsa Craig, weighing 26½ lb. Mr. WILKINS was again 1st out of thirteen competitors with twelve specimens of Rousham Park Hero, Anglo-Spanish, The Lord Keeper, or Royal Jubilee, these representing the flat, as the former class did the globe-shaped Onions, having finely-finished Anglo-Spanish, 20½ lb.; Mr. WAITE, Glenhurst Park Gardens, coming 2nd with the same, 18½ lb. The best twelve of Improved Wroxton, a globular variety that is recommended as an excellent keeper, came from Mr. PEASE, The Gardens, Swalcliffe Park, Banbury, weighing 14 lb.; Mr. WILKINS was 2nd, with 15 lb., but the specimens lacked the superb finish of those shown by Mr. PEASE. The best twenty of any Onion, shown by cottagers, came from Mr. MOSS, Hackwood, Basingstoke, they were Ailsa Craig, weighing 30½ lb. Collections of eight kinds of vegetables sent out by Mr. DEVERILL were invited, and five really superb collections competed. Mr. POPE was 1st, Mr. WILKINS 2nd, and Messrs.

WAITE and R. LYE equal 3rd. The question sometimes arises: Do these large Onions keep well? And the growers one and all assert they do. They are greatly esteemed for boiling whole, and serving up with sauce. One nobleman has one every day for his dinner, and they are valued for "braising"—a favourite dish with many of the gentry.

ARAUCARIA BIDWILLII.—The *Revue Horticole* announces the fructification of this fine species at Antibes. Each of the four cones was bigger than a man's head. One weighed 4 kil. 890 grammes, the other 4 kil. 730 grammes.

WASPS have been as abundant in France this season as here.

ONCIDIUM ORNITHORHYNCHUM (see p. 338).—The word album was accidentally omitted in the mention of this plant. The white variety is indeed still rare. The plant at Mr. PEETERS' bears now more than 500 flower-buds.

CALIFORNIA.—The first botanists to collect in California are generally considered to have been THADDEUS, HENKE, and LUIS NEE, in 1791. Mr. WILLIS JEPSON, however, in *Erythea*, notes that LA PEROUSE's expedition sailed from Brest in 1785, and anchored in Monterey Bay in 1786.

PLANT PORTRAITS.

- BOMAREA FRONDEA, Mast., *Gard. Mag.*, September 2.
- CALANTHE GIGAS, *Garden*, September 9.
- CATLEYA BLESENSIS, C. pumila × Loddigesii, *Revue Horticole*, September 16.
- KALANCHOE GRANDIFLORA, Rich, *Garten Flora*, September 1.
- LYCASTE SCHOENBRUNNENSIS ×.—A hybrid between *L. gigantea* and *L. Skinnerii* raised at Schoenbrunn. It has the bulb of *L. gigantea* and the flowers of *L. Skinnerii*. *Wiener Illustrierte Garten Zeitung*, August.
- TUPISTEA SQUALIDA, *Revue Horticole*, September 16.
- VIRESIA HIEROGLYPHICA, E. Morren, *Garten Flora*, September 1, p. 521.

NOTES FROM KEW.

SOLANUM SEAFORTHIANUM.—This is one of the finest climbing plants for a warm house in cultivation, and yet it is seldom seen in gardens. It blooms for many months in the year, and is remarkably graceful, the plant growing rapidly, quickly climbing up a rafter. The leafage is abundant, and the light purple flowers are produced in clusters. It is in bloom in the Royal Gardens, Kew, and quite a contrast to the large-flowered *S. Wendlandii*, which is in bloom in the Water Lily-house. *S. Seafortianum*, although so uncommon, is not a new plant, as many figures have been published of it, the last a coloured illustration in *The Garden*, December 10, 1892; whilst it is also figured in the *Botanical Magazine*, t. 5823, as *S. venustum*. It is a West Indian plant, and found plentifully in Trinidad, where it covers the bush growth as the common Clematis in English hedgerows.

HYPERICUM OBLONGIFOLIUM.

Few shrubs bloom through the autumn with the same persistency as the Hypericums, and *H. oblongifolium* is one of the most graceful and beautiful of the genus. A drawback is its tenderness, but when in a sheltered spot, and the soil is not heavy, the shrub attains many feet in height, studded with rich yellow flowers. A good specimen of it is very striking, and the flowers are produced with the utmost freedom. *H. oblongifolium* is an Himalayan species, and was first introduced by Messrs. J. Veitch & Sons in the year 1856, or about that time. The Khasya mountains are its chief habitat, and it grows at a high altitude, as much as 12,000 feet, but varying greatly in this particular. In the more southern gardens of England, this fine shrub could be well established. It succeeds very well at Kew, and into the winter even, bears many of the large finely-coloured flowers.

AMARYLLIS BELLADONNA.

If the present year has proved trying to hardy plants and many flowers of the garden, it has suited well those things that need warmth and sunshine to bring them to perfection. We have never seen *Amaryllis belladonna* more beautiful than this autumn, particularly at Kew, where the bulbs are planted in a narrow border against the Orchid-house. It was figured in the *Botanical Magazine* in 1864, and is a native of the Cape of Good Hope. The position in which the *Amaryllis* is at Kew is southerly, and no doubt much of the success of the bulbs is due to the fact that they derive benefit from the heat of the house. A border of this description is to be found in many gardens, and nothing could be better used to fill it than this *Amaryllis*, the best time to plant which is when the flowers have faded. A depth of 6 inches is sufficient, but almost a foot apart will be advisable. Give the border plenty of drainage, and let the soil for the bulbs be loam mixed with a fair proportion of leaf-mould and a little rotted manure. This preparation is essential to get the best results, and unless the position is warm and southerly, it is useless to attempt its culture, as the bulbs never succeed. The flowers of the *Amaryllis* vary considerably in colour, but the deeper-coloured forms are the more striking, producing a richer contrast with the deep chocolate scapes.

HEDYCHUM GARDNERIANUM.

A very fine specimen of this species is in bloom in the temperate-house at Kew, and it is not often grown in gardens, although one of the best of the genus. It was introduced from the East Indies in 1819, and blooms freely during the best part of the summer; the flowers are a kind of Apricot-yellow, borne in very large racemes, and richly fragrant. It is not a difficult plant to grow, and is comparatively hardy, at least it may be planted out in the garden for the summer months, where it makes a fine feature in summer-bedding arrangements. In the warmer and quite southern counties it might be trusted entirely in the open if the crowns are protected with cocoa-nut fibre refuse or similar protective material in the winter months. It blooms freely in the open, and the flowers will quite scent a small garden. 17.

HOME CORRESPONDENCE.

MR. MANNING.—It has been known to most of us that Mr. Manning will shortly resign his position as general manager at Messrs. Jas. Veitch & Son's, Chelsea—he deserves a well-earned rest. Mr. Manning commenced in very early life at the Exeter Nurseries, and after the death of the grandfather of the respected head of the present firm, came to Chelsea with Mr. Dominy. It goes without saying that during the many years he has been in the firm, he has given keen insight into the character of every gardener who came into the firm for situations. It is also well-known that those who have been placed in positions have shown that they were worthy of such positions; on the other hand, to those who have felt the benefit of Mr. Veitch and Mr. Manning's experience in selection, I would suggest that on Mr. Manning's retirement, an illuminated address with names be presented to him, showing their appreciation of his character. If those who have passed under his hands would send but 6d. by postal note, the matter would be complete, and should a surplus arise, I know where Mr. Manning would wish it to go, viz., either to the "Gardeners' Orphan Fund," or to the "Gardeners' Benevolent." I shall be glad to accept the position of hon. sec. to any such fund. *Fred. Horsman, Colchester.*

MARKET PRICES.—I think "Grower" (see p. 341), in writing on this subject, has "hit the right nail on the head" in suggesting the development of local trade rather than sending so much to Covent Garden Market and other over-supplied centres. However, before fruit-growing can be made to pay, either locally or otherwise, he or anyone else must send fine fruit of the better varieties. Take Apples, for instance, no matter how large the quantity of fruit of inferior kinds is sent to the market, good

samples of approved varieties will sell in spite of an apparent glut and the general lowering of prices. During the present season, in my locality Apples were never more plentiful, and no difficulty is experienced in obtaining 5s. per bushel for cooking varieties such as Lord Grosvenor and Warner's King; while any quantity of the local varieties as Deux Ans have been sold for 1s. 6d. per bushel, and at times there has been a difficulty in realising that price. If fruit-growing is to be made to pay, it must be by cultivating superior varieties of any kind of fruit. In this part of the south of England at any rate, there has been a lack of dessert Apples; and what few Worcester Pearmains, Nannie, Quarrenden and Lady Sudeley there were, have been snapped up at once, at remunerative prices. So much in demand are the dessert varieties, that several orchards are already cleared of King of the Pippins, Cox's Orange, and Blenheim Orange Pippins to meet the demand. *A. B., Southampton.*

SPIRÆA ARUNCUS.—My experience of this herbaceous plant, figured so finely in the *Gardeners' Chronicle* last week, leads me to say that there are undoubtedly two forms of it in existence. One, a tall grower, and the other of much less height, and more "dumpy" in the inflorescence. The latter variety flowers with me fully one month earlier than the other. It is, I take it, not a question of cultivation, but purely a typical difference. As a plant for a shrubbery, *Spiræa Aruncus* is well adapted for making a fine, showy effect. *E. M.*

A SECOND CROP OF FIGS IN THE PRESENT YEAR.—I have this day commenced to gather off a tree of the Marseilles Fig on an outside wall, with a south aspect, the second crop of fruit, which is ripe, and of good flavour, although small. Is this not most unusual? *C. Watkins, Glyndebourne, Leves.*

MAIZE.—Mr. Morgan has misunderstood the intended meaning of my letter. I never had any difficulty in growing green corn on "plants from 3½ to 6 feet high." We grow it simply for decorative purposes in the flower gardens, and the effect of plants of a distinctly tropical habit 9 feet high is very different to that of the same plant only 3½ feet. It would have been a parallel case if I had stated that we could grow Peaches 9 oz. in weight, and Mr. Morgan had stated that I must have been "very unfortunate," as he could grow them 3½ to 6 oz. There is no better decorative plant than ordinary Maize, and its effect increases enormously with its size. It must also be remembered that the climate in Cheshire is very different to that in Essex, and it is probable that if Mr. Morgan had grown the Zea caraguaga this year he would have had it 12 feet high, with ripe cobs probably 1 lb. in weight each. *Thos. Fletcher, Grappenhall, Cheshire.*

THE LARCH DISEASE IN YORKSHIRE.—So far as I know, there have been no means taken by the Government to stop the spread of this pest. That it might be controlled to a certain extent, is a fact that is obvious to anyone who has studied the nature and progress of the pest. I refer to the disease known scientifically as *Peziza Wilkommii*, and not to other maladies. In the district around Ledbergh, the disease has established itself, and has killed, and is now killing off wholesale the plantations of Larch. Oldish trees, above forty years, are affected on the branches only. The rough thick bark of old trees seem to be proof against the attack, i.e., on the main stems, but on the branches the pest shows itself where the bark is thinner, and in such places huge knots are to be seen, and the branches are dying or dead beyond the knot. The question naturally arises in an observer's mind:—"How did the disease gain a footing on such trees? Clearly not up the main stem, as these in most full-grown trees are sound. The wind, in my opinion, or, more likely, small birds, of the ox-eye or finch tribe, are the real cause of the spread of it. Fencing the margins of healthy woods with timber that had died from the effects of the canker is also another cause of its appearance in fresh localities. Rabbits and small burrowing animals might also spread the pest, as the fungus attacks the roots of the tree. The planting of fresh plantations of Larch in proximity to infested districts is a fertile source of propagating and perpetuating the disease, inasmuch as the agents already referred to spread the spores, and there is ample evidence that the disease flourishes on young trees of six to twelve years, when they are partly sheltered with grass and tall herbs, &c. Similar Government regulations as

those already in existence for preventing the spread of pleuro-pneumonia should be enforced by Act of Parliament. The soil of the district is pre-eminently adapted for the growth of Larch, and it is hopeless to attempt to grow it until all diseased trees are burnt, or treated with tar, creosote, sulphate of copper, when used for fences and sundry purposes after being felled. The ground where diseased trees grew should be cropped with other kinds of trees for one rotation at least, as although the diseased trees were grubbed out, it would be impossible to take out the smallest particle of root, the smallest of which might contaminate a whole plantation. If all affected trees were cut, the planting of Larch on a fresh site would be quite safe, as the agents referred to would not be able to spread the pest. The disease is widely spread all over the country, and especially so along the side of the London and North-Western. Between the district I refer to and Carlisle, many plantations can be seen with the Larch in a dying condition, which is due, presumably to the presence of *Peziza Willkommii*, but as I did not examine the plantations personally, the latter may be due to the inimical nature of the soil, which is often the cause of failure in Larch woods. *R. W. Milne.*

GALANTHUS BYZANTINUS.—I find that the honour of introducing *G. byzantium* to English gardens belongs to Mr. W. C. Mountain, of Constantinople. This new species was found on the Asiatic side of the Marmora, and was supposed by Mr. Mountain to be *G. Elwesii*, and was so labelled by him. Another Snowdrop was collected on the European side of the Marmora, and this Mr. Mountain believed to be *G. Redoutei* or *G. latifolius*. It certainly is not *G. latifolius*. Whether it is *G. Redoutei* or not the next spring must decide. Most collected bulbs flower very weakly the first season, and it is consequently very difficult to decide what their real characters are before they have flowered a second time in our gardens. *James Allen, Park House, Shepton Mallet.*

KEW NOTES.—A friend of ours has drawn our attention to a note which appeared in June 3, p. 658, of your valuable periodical under the heading of "Kew Notes." Unfortunately, this number never reached us till a few days ago, so that we can only now reply to "W. W.," hoping that you will kindly allow a short space to the following remarks. *Alocasia Dussii* was collected for us in the island of Martinique by Mr. Duss, a missionary, who at the same time is a passionate lover of flowers and a botanist. Grateful as we are to him, we provisionally named the plant after him from our standpoint as nurserymen, but also from a botanical point of view we doubt that it has anything to do with *A. antiquorum*. This latter has much larger, erect, green leaves, broader leaf-stalks, forming by-and-by stems above the ground of about 3 feet, is such a common plant in all the European gardens, that nobody can possibly mistake it. *A. Dussii* has smaller leaves, which do not stand upright as those of *A. antiquorum*, but are pendent or horizontal as those of *A. esculenta*; they are of olive colour, not bright green, with brown-red veins or ribs, the petioles dark brown. The plant pushes subterranean stoles often 3 feet long; the flower resembles that of *A. antiquorum*, but this fact alone is certainly not sufficient to prevent us as nurserymen considering it different, or from giving to it another name. By doing so, we have not departed in the least from the general practice; if so, then any raiser or importer of a new variety of Rose or other plant would not be allowed to give a special name to one differing in some way or other from the sorts already known. But how many have been introduced and offered in such a way, although they may not be recognised by botanists! *Crinum yemensense*, described by the botanist Defflers in his *Voyage au Yémen*, p. 209, was imported by us direct from its original locality. Mr. Defflers, owing to his frequent trips in Arabia, knows the flora of that country well, and upon our inquiry if he ever met with *Crinum latifolium* in Arabia, he strictly denies it. Moreover, the well-known botanist, Professor Schweinfurth, who also travelled in Arabia, and who saw the *Crinum yemensense* in flower in our grounds, recognised it as such, stating that it differs from *C. latifolium*, which Mr. Baker also admits. We grow *C. latifolium* and *C. yemensense* side by side, and from a nurseryman's standpoint it may at once be perceived that the latter greatly differs from *C. latifolium*. Grown under the same conditions, *C. yemensense* has a much larger bulb, is of more luxuriant

growth, with larger, longer, and undulate leaves of a light green colour, while those of *C. latifolium* are dark green. It is distinguished further by its more vigorous flower-stalks, the umbels carrying a larger number of flowers of a long neck, while the latter are of a brilliant white; and further, through the fact that it loses all its leaves in winter, while *C. latifolium* holds them [?]. These considerations entitle us fully to offer this variety as the one which has been described by Mr. Defflers, and to offer it also in future as *C. yemensense*. We grow almost all the known varieties of *Crinum*, and only a few rival it in beauty, but certainly not *C. latifolium*. We grow nearly a million [?] of all sorts of *Crinum*. On the other hand, "W. W." is perfectly right as to *Amorphophallus giganteus*, and we regret very much having sent to Kew *Sauromatum guttatum* instead of the *Amorphophallus*. But whoever takes the trouble to look over our catalogue of bulbs—and who knows what pains we take in having our collection rightly named—will at once know that the above fact must be attributed exclusively to some blunder. Those Aroids that require culture during summer are all grown in a special department, by which it may be explained how such a mistake happened. No one can mistake *Amorphophallus giganteus* for *Sauromatum guttatum* had he but a limited knowledge of these plants. *Dammann & Co.* [Our correspondents would do well to submit their plants to competent botanical authority for naming, or if they wish to name them themselves, then to use vernacular names or such names as are not likely to mislead. *Colocasia antiquorum*, like all long-cultivated plants, runs into many forms which are not worth specific names, but which horticulturally, it may be, are deserving recognition. For such forms popular names should be used. We are always ready to help nurserymen in the determination and publication of "new plants." Ed.]

GROWTH OF LARCH AND OTHER TREES.—In spite of the abnormally dry season, it is astounding what an extraordinary length of leader some of the Larch trees have made; and, on the contrary, how small has been the growth of others. Some Larch which were planted in an open field on this estate (South Hants) during the autumn of 1889, in good soil, with a retentive subsoil, have made unusually long leading shoots, one in particular measured 3 feet 11 inches, and many of these trees have made leaders of 3 feet in length. In the home nursery, 2 year seedling Larch, planted in April, 1892, have made leaders 2 feet 6 inches long; the side-shoots are also of great length. Scotch, Austrian, and Corsican Pines have likewise grown well, but the Spruce Firs have made but 6 inches of leader instead of 18 inches and 2 feet as last year. In the latter case, I think it is owing to the extremely dry weather experienced last April, which checked the pushing of the shoots in May. *E. M.*

VERBASCUM CHAIXI.—To what an abnormal height the above species has grown this year. A strong plant growing in heavy soil among some *Rhododendrons* reached 8 feet in height, and lasted for a very long time in bloom, and showed well above the heads of the *Rhododendrons*, whose foliage formed a good setting for the flowers. *E. M.*

STOCK AND SCION.—I send per parcel-post a section of Peach Early Louise (Rivers) that went wrong this season; it has shown an enlargement since the first year it was planted. On seeing some roots forming, I placed some moss and soil to entice them from the Peach, but it looked queer last autumn. I have had Alexander and Princess of Wales go the same, and they have been on Mussel stocks; if I remember rightly, this one is on a Damaak stock. I have no microscope, but it appears as if there had been no true union; and though it appears that the stock died first, yet suckers were coming up last year close to stem. The first symptoms of anything being wrong with previous ones has been the stock breaking out just below union. *R. F.* [The section shows that there was a great difference between the rate of growth of the scion and of the stock, so that whatever the stock may have been, it was one quite unsuited to the scion. The scion has endeavoured to shift for itself by the formation of roots. Ed.]

DWARF FUCHSIAS AS BEDDERS.—Possibly the variety Dunrobin Bedder may be a seedling from the Riccarton, and if Mr. Melville says it is, we have no cause or inclination to dispute its origin; but I

should have been more inclined to suspect its being either a seedling, or a fugitive plant of the old and very dwarf *Fuchsia globosa*, which I can very well remember being in existence fifty years ago. It was some time during the years 1846 or 1848 that the white *Fuchsia Venus victrix* first came under my notice. My memory is strengthened from the fact that with a horticultural crony of my own age I exchanged a cutting of *globosa* for one of his *Venus victrix*, and of the transaction I do not know which of us, he or I, was the prouder. This took place in the then small town of Dunoon, but now, with its late purchase of the castle grounds, a town on the Clyde—"doon the watter," as the Glasgow bodies say—of considerable importance. Some years after coming to Coombe, some one brought to the gardens from one of the neighbouring villages, a plant of a dwarf *Fuchsia*, which I at once recognised as the early acquaintance of my boyhood. Between the years 1870 and 1880 or thereabouts, I, like many others, was seriously affected with the bedding-out craze, and whilst looking about for material to use, my eye fell upon the dwarf *Fuchsia globosa*, and to this end it was taken in hand, and propagated in great numbers. It was used successfully in many ways, which I need not here describe. Suffice it only to say that its introduction amongst our sundry devices succeeded in gaining the admiration of Mr. Spinks, himself a master hand at bedding. Mr. Spinks was then manager of the Aston Lower Grounds, which he for a number of years so cleverly superintended, and from whence he set the whole midland counties ablaze with his system of bedding. I still retain a breed of the old *globosa* by me, ready for any bedding-out emergency which unforeseen circumstances may bring about, but in the meantime this system has been abandoned at Coombe. Depression in the farming interest compelled us long ago to turf down all our out-door floral extravagances, and I am not certain if the green turf, with which it was replaced, does not look quite as well; yet I confess that I take any opportunity to look and dwell admiringly on a piece of carpet-bedding well carried out. *Fuchsia Riccarton globosa*, and the old coccinea variety, are here cut down to the ground every winter. To keep them alive at the root we are obliged to cover them up with dry leaves. But in the milder climate of the west of Scotland, and under favourable circumstances, the Riccarton will grow from 15 to 20 feet high. On the east shore of Lochortriven, I remember, when a boy, seeing a carriage-drive, both sides of which were lined with the Riccarton, which, to the best of my recollection, must have been 15 or 20 feet high. I will qualify this statement with a doubt whether it was the Riccarton, or whether another variety known as coccinea. As I had never before seen Riccarton grow so high, and the spindling form it took, made me suspect it to be the former variety. The carriage-drive was cut through a natural growth of Hazel, Birch, Oak, &c., which gives character to the scenery all along the coast of the Western Highlands. These gave shelter to the *Fuchsias* from the boisterous west winds off the loch. The steep hill-side was the protection from the east, and the mild winter climate of those regions was an extra advantage. But as a Yankee would say, "I guess" there is a wide difference between the winter climate of Dunrobin and that of the Royal Horticultural Society's gardens at Chiswick. Your correspondent "V.," p. 156, will, I am sure, pardon me for being bold enough to assert that however valuable an acquisition the Dunrobin Bedder may be, it is not the first dwarf *Fuchsia* by many a year, that has been used as such, and that in my memory at least, dwarf *Fuchsias* as bedders, effectively introduced, have not yet been relegated to the realms of absolute oblivion. The note of "V.," together with these remarks from me, will, I hope, help to popularise the use of dwarf *Fuchsias* as bedders. If anyone will only give them a fair trial I feel sure they will be inclined not only to repeat, but to even extend the experiment. *W. Miller, Coombe Abbey.*

JUDGES AND SCHEDULES.—So long as schedules of prizes are drawn up with the looseness which pervades that of the Cardiff Society—a copy of which lies before me—much must be left to the interpretation of the judges. And I am disposed to think, in reference to the particular case mentioned, they took a just and reasonable view of the wording of the class, though it might not have been a strictly technical one. I am informed, on the best authority, that the committee of the Cardiff Society, with one or two obvious exceptions, cordially support the action of the judges at the late show, which was upon the lines which have always been followed at

their shows. To illustrate how loosely the Cardiff schedule was drawn up, class 75 is for "Dessert Fruits, six dishes, distinct kinds." Exception was taken to the award of the judges in this class on the ground they had accepted White and Black Grapes as distinct kinds. But the judges did wisely—as I have no doubt their colleagues in the cut-flower classes did—in putting themselves in the places of the framers of the schedule, and endeavouring to ascertain what was in their minds. Thus, class 71

FIG. 59.—PINE-BEETLE (HYLURGUS PINIPERDA). Much magnified, and Pine shoots bored by the beetle.

reads, "Melon, best, any kind;" class 74, "Melon, the two handsomest of any kind;" class 76, "Apples, dessert, collection of six dishes, distinct kinds;" and so on. It was obvious that the compilers of the schedule employed the term "kinds" as synonymous with varieties; and in using the term "exotic," they having provided classes for hardy flowers, including Dahlias, Zionias, &c., put in one for flowers of plants grown under glass, and to distinguish them from hardy flowers, employed the term "exotic," in the sense in which it is frequently employed in schedules of prizes. It might be appropriate at a botanical exhibition to use the term exotic in its strictly technical sense, but in all schedules of prizes, excepting special cases, the term exotic is used and understood

FIG. 60.—SPRUCE-GALL (CHERMES ABIETIS).

to denote plants grown in warmth, and that is why it is, as recently at Shrewsbury, where we may suppose the ablest of judges are engaged. We are so constantly seeing *Adiantum cuneatum* var. *gracillimum* exhibited as an "exotic" Fern. I cannot conceive that the committee of the Cardiff Society, whose aim it must surely be to secure the most attractive exhibition possible, to be desirous of excluding from a certain class any fine home-raised plant of beauty. They would be earnest in repelling so unpatriotic a suggestion. *Western*. [The Fern in question is certainly not wild in Britain, but of exotic origin. Ed.]

FORESTRY.

INSECTS INJURIOUS TO FOREST TREES.

SURELY these are greatly on the increase in this country. During the past fortnight I have visited large extents of woodland in at least three of the south-midland counties, Northamptonshire, Buckinghamshire, and Bedfordshire, and in every instance the same question has been asked me, What remedy can you suggest to lessen the depredations of these injurious insects? No coniferous tree would seem to escape, each one having some particular insect or fungoid pest that renders whole woods unfitted for any economic or ornamental purpose.

The Scotch Pine suffers severely from the ravages of that dread insect, the Pine-beetle, *Hylurgus piniperda*, see fig. 59. The Spruce is being killed out or rendered very unsightly from the attacks of the Pine-apple-gall or Spruce-gall (*Chermes abietis*), see fig. 60; while the Larch is being killed wholesale in many woods by the Larch-canker, and which is due to the minute fungus, *Peziza Wilkommii*, see fig. 61. But this is not all, for the deadly insect *Liparis monacha* has likewise made its appearance; and others of quite as destructive propensities have, during the past unusually warm and dry summer, been detected in no small quantities. *Tomicus typographus*, *Pissodes Pini*, and *P. rotatus* have also been recognised, and several others are under examination.

The Pine-beetle is present in unusual quantities—indeed, to such an extent do the ravages of this insect extend, that acres of young Scotch Fir are either completely killed out, or crippled to such an extent that their future value is hardly worthy of consideration. Young trees, of course, suffer most; but after the age of, say, twenty to twenty-five years, the attacks are less persistent, probably owing to the shorter and more matured growths of the trees.

The special form of injury done to Pines by this beetle consists in its boring into the young shoots for feeding purposes, and which is effected by working a lateral hole in the twig, usually at about 6 inches from the tip, and boring upwards for an inch or two through the pith, and which it only quits at the beginning of winter for purposes of hibernation. This tunneling so weakens the shoot, that with the first storm it breaks readily over, either at the point where an entry or exit was effected, and occasionally where the beetle is present in quantity, the ground becomes strewn with the fallen shoots, or, what looks worse still, they hang from the branch tips as if these had been riddled with shot. I feel confident that in Bedfordshire, at least, the great increase of this particular beetle can be attributed solely either to neglect or a want of knowledge of the life-history of the insect. Few persons seem to be aware that this beetle does not, as a rule, hibernate in standing trees, but chooses fallen trunks or branches, dead or dying trees or stumps, in which to deposit its eggs; and this of itself should make those in charge of woods and plantations be very careful that all branches or prunings—in fact, every kind of felled wood—are removed from the ground as soon after being cut down as possible. Prevention in this case is far better than an after care, for once the insect gains a footing, the most stringent measures are required to place a check upon their depredations. A very common practice, too, is to follow a crop of Scotch Fir with that of the same kind; but a careful examination of such woods will soon betray the fallacy of this course of forest management. Apart altogether from the fact that recropping with the same species of tree is inimical to the growth of the plantation, the stumps of the old Firs that are left in the ground serve as the best possible breeding-place for the Pine-beetle, and the newly-planted trees the best feeding-ground.

Wherever the Scotch, Austrian, and Corsican Pines are grown in quantity, but particularly when old and young breadths of the trees occur in close proximity, the greatest care is necessary to prevent

the inroads of the Pine-beetle, and this can only be done by a thoroughly well worked-out system of forest management.

Cleanliness and neatness, by having no dead and dying wood and lopped-off branches lying about in

FIG. 61.—LARCH FUNGUS (PEZIZA WILKOMMII).

the woods, and by attending to the general health of the trees, will alone assist in keeping this insect pest at bay. Once it gets a footing in large breadths of timber, extermination, be it only partial, is a task of the greatest difficulty, and attended by heavy ex-

FIG. 62.—PINE SAW-FLY (LOPHYRUS PINI).

penses; indeed, the only sure way in such a case, is the drastic measure of cutting down the infected trees, and burning them on the ground. This, too, is a measure requiring the greatest care, and a deep in-

sight into the life history of the insect. To cut down and burn the trees in winter is lost labour, in so far as concerns the destruction of the insect, for the beetle at the beginning of winter quits the shoots, and hibernates in moss, &c., or low down at the base of the trunk. By collecting old trees and branches that are lying on the ground not later than the beginning of June, and carting these away, or carefully burning them in the wood, great good may be brought about, the number of beetles present being greatly diminished by such a course of procedure. The felling infested trees that have been ringed and left as traps in February, when the beetles are breeding in the bark, is another excellent method of lessening their numbers, but such work requires to be very carefully gone about.

In connection with the Pine-beetle it should be remembered (1) that it never breeds in the shoots where it feeds, (2) that its eggs are laid in dead and dying logs, on or near the ground, early in April, and (3) that the larvæ appear as perfect beetles in June and July.

The Spruce Gall aphid (*Chermes abietis*) is very abundant all over England, and this season in particular its depredations have been increased to an alarming extent. When abundant, the general health of the trees is seriously affected, while in every case crippling and distorting of the branches is brought about by this much-dreaded insect. Having passed the winter in crevices of the bark, the Chermes appear in the spring as ochre-coloured wingless insects, and attach themselves to the young and tender leaves of the Spruce. A mass of eggs is laid on the tender shoot, usually where two twigs meet, the larvæ of which, when hatched, tap the shoot with their beaks, this causing the swelling known as the Spruce Gall, and which resembles a small Fir cone. In August the winged insects leave the "cones." To cope with this insect is a by no means easy task, although in the case of single specimens, hand picking and destroying the galls in June or July will be found productive of a great amount of good.

Probably the worst enemy to young Conifers, and one that unfortunately is by no means uncommon, is the Pine-weevil (*Curculio (Hylobius) abietis*). The beetle attacks nearly all the Pine tribe, as well as the Larch, Spruce, and at least two species of Cypress, the depredations consisting in the eating of the bark of the shoots and tender twigs. To such an extent is this gnawing of the bark carried on, that frequently whole branches are rendered barkless in a few days, an unusual flow of resin being the result. Usually only young Fir trees are attacked, up to, say, the age of ten years, and nursery stock often suffer to a great extent.

By keeping the woods free of dead and dying twigs and logs, no breeding-places will be found, and so the extermination of this, like most other beetles, is a matter of no great difficulty. Another occupant of our woods and forests is the Pine saw-fly (*Lophyrus Pini*), see fig. 62, its damages being extended to the partial devouring of the needles of the infested tree.

The Larch-miner (*Coleophora laricella*) feeds on the centre of the Larch needles, which it mines into, causing these to turn yellow and drop off in great quantity. This may not kill the tree, but going on for year after year the attacked specimens rarely have a healthy appearance. It is very plentiful in England.

Another very common occurrence in our Pine woodlands is to see the shoots deformed and twisted, and the terminal buds stunted and falling off, an evil that is due to the attacks of the Pine-shoot moth (*Retinia buoliana*). The larvæ live in the trees through the winter.

There are many other insects that cause considerable damage to our coniferous trees, but the above may be considered as the principal or worst forms with which the forester has to cope. The "Larch disease," or "Larch canker," as it is commonly known by, is, unfortunately, very much on the increase in this country; indeed, during my experience I have never seen such wide-spread devastation as is to be met with this season. It is due to a minute fungus known as *Peziza Wilkommii*, and which

spreads wherever a footing can be got, with terrible rapidity.

The main point to attend to in coping with this malady is to preserve the Larch plantations in as healthy a state as possible, and to do this, the following rules should be rigidly observed, remembering that the fungus can only find a footing where the bark of the tree has met with injury in one way or another—

1. Plant the tree only on suitable soils.
2. By careful management, keep the trees in as healthy a condition as possible.
3. Choose healthy, strong stock to start from; and—
4. In collecting Larch seed for propagating purposes, select only such as has been matured by a winter's frost, and from healthy trees in the prime of life. (No. 4 should be rigidly observed, for owing to neglect of these precautions deterioration of the Larch has long been going on.)

As showing the wide-spread damage that has been inflicted on coniferous trees of late, I might specially refer to a case in South Wales, where thousands of Larch trees have been destroyed by the above fungus; to numerous cases in England, where the Pine-beetle is causing widespread devastation in the Scotch Fir woods; and to serious damage in Ireland by several of the other insects named in this paper.

Abroad many striking examples might be mentioned, such as in East Prussia, Poland, and Russia, where in the fifteen years, from 1853—68, the Spruce was killed over an area of 7,000 square German miles; and two years ago in Bavaria, where damage to the trees amounted to fully £40,000. In both instances that destructive insect, of which we are by no means free in this country, *Liparis monacha*, was entirely to blame.

The great importance of the attack has caused owners of woodlands in this country to look better to the general health and cleanliness of their woods and plantations, than has ever before been the case; and the numbers of specimens of insects that have been sent for inspection and naming, also proves that a great additional interest is being awakened in the matter.

In conclusion, it may be stated that, as a rule, so as to keep these insect pests in check, no loppings or windfalls should be allowed to lie about in the woodlands, such only affording the best of all breeding-grounds, and consequent spread of the evil. *A. D. Webster.*

STRAWBERRY-BEDS.

In many parts the crops of Strawberries were very abundant, and in deep moderately heavy soils the size of the fruits as well as the quality were very good; but on those that are light or shallow, the drought caused a short season of bearing and small fruits, and the plants were so crippled that in our garden the prospects for next year are not bright—many plants will, I fear, fail to flower. Young plants of Noble and Vicomtesse Hélicourt du Thury growing on deeply worked land, have withstood the drought fairly well, and the produce was good, but older plants quickly gave out, and the fruit was only about half the usual size. It is in large areas, in market gardens and fields, that the drought is likely to have caused the most harm, as in these the plants have to take their chance, watering them, being, as a rule, beyond the resources of the grower.

Supposing that, in the garden the beds have been cleared of weeds, and the plants of runners and some of the old leaves, the hard soil should be lightly pricked over with a fork, and a top-dressing with fresh soil, charred earth, or garden refuse, old hot-bed and the like materials should be spread over the roots, first heavily watering the beds, and unless this be done, the dressing will have little good effect.

Where beds were mulched with good manure and repeatedly watered, this alone will show a marked effect in the vigour of the plants. Young plants seem better able to resist drought than those that are several years old, and it is always advisable to plant some new beds yearly, and destroy the same quantity of old ones. Young plants in pots may

still be planted out-of-doors, twice as close together in the rows as they will stand after fruiting once, the superfluous plants being grubbed out afterwards. If planted somewhat closely together at the foot of a south wall, some nice fruits may be obtained fully a fortnight before those in the open quarters. *H. Markham, Mereworth Castle.*

NURSERY NOTES.

BROXBOURNE NURSERIES.

SOME might think it unfair to visit a nursery at this time of year, especially after such a season as we have had. On the other hand, an excellent opportunity is afforded of seeing what has done well, and, in the case of a general nursery like that of Messrs. Paul & Son, go when he will, the visitor is certain to find something to interest him. Just now, the famous Atkins collection of *Cyclamens* is in full bloom. Neither heat, nor drought, nor the shade of trees, nor the exactions of Elm roots, has had any effect on them. There they are, bespangling the ground, like so many gems, in a setting of foliage as beautiful as the flowers themselves. At Kew also, the *Cyclamens* show well up amidst the Ferns, among which they are planted. Judging from the situations in which they are found in Switzerland and Germany, they seem to like shade and a deep layer of leaf-mould. The flowers vary in colour from violet-pink and rose to pure white. We cannot attempt to describe them, but we recommend those who are interested to go and see for themselves. They will find in addition much to attract their attention among the Saxifrages and Sedums, some of which have been severely tried this summer, they will see a bed of *Senecio pulcher* which has enjoyed the heat, its thick fleshy leaves enabling it to withstand drought, albeit rendering it a prey to an Orange fungus, *Coleosporium*—one of those many-homed individuals which puts on a fresh dress in each home it occupies—"heteroicous" the learned call it. *Aster acris* and *Aster Amellus*, common plants, are nevertheless gorgeous to behold. *A. alpinus albus*, by the way, is, we are told, more robust than the common form. A bed of *Rudbeckia purpurea* reminded us of a once well-known nursery from which this and many another herbaceous perennial was destroyed some thirty years ago as cambering the ground, whilst now the old friends are coming back. *Stokesia cyanea* is another noticeable plant, like a blue China Aster, which has thriven in the heat. *Morina rosea* is still in beauty. *Clematis Davidiana* is at first sight as unlike a *Clematis* as one can well imagine. Botanists see strange resemblances, but this time they are clearly absolutely right, as any one who pulls the flowers to pieces may see for himself.

The rock garden has of course always something of interest on it. *Omphalodes Luciliae* is one of its distinguished inhabitants, and of a quite different character are the *Polygonums*. *P. sachalinense*, with its broad leaves, has been lately recommended as a forage plant, a circumstance that induced us to make an experiment upon Mr. Paul's horse. The sagacious animal had no prejudice against experiments, and munched the leaves with relish, and we are happy to add, with impunity. *P. cuspidatum* is nearly allied, but has thicker and more cordate leaves. *P. molle* has a similar tall habit and loose spikes of white flowers, but the leaves are narrowly lanceolate. *P. compactum*, another of the same breed, is to be commended for decorative purposes, whilst anything more brilliant than the spikes of the relatively lowly *Polygonum Brunonis* can scarcely be imagined. We began this note with the intent of calling attention to the *Cyclamens*, but we have been led on to speak of other things. As we shall have more to say later on about the Cannas, we may as well stay our hands now.

Messrs. T. F. RIVERS AND SONS, SAWBRIDGEWORTH.

Late as the middle of September in this early year, there is much remaining out on trees in the quarters, and on trees under glass, and trees in pots in the

open air, to occupy a long day in their inspection. As a tramp through an extensive place in the search for everyday things is neither profitable or desirable, and results in no useful purpose to our readers, we avoided it. A glance at the fruiting canes of Vines growing in serried ranks in one or two houses, showed how brown, strong, and well-ripened they are. We do not ever remember seeing Vines in finer form. The Figs for fruiting in pots are remarkably good, and bristle with embryo fruits. Such half-tropical subjects as Figs and Vines, and Peaches and Apricots, have enjoyed our unusually warm summer immensely, and they are likely, if next year be favourable, to render a good account of themselves.

The workmen were basily engaged in re-potting some 500 of the Early Rivers Nectarine, which is a variety that leads all others by three weeks in regard to early fruiting, a fact that market-men will be quick to note, as there is "money in it." The trees were almost bare of leaves, and the shoots, every one ripe and red to the tips, in fact, capital twiggy pyramidal trees certain to bear well. We believe 30s. per dozen was the price received for fruit of this variety in the current year, which is not bad returns to the "poor" grower, but the fruit must be good. Lord Napier must now retire from the front rank as an early, it never did take first place for flavour.

Gardeners do not like Peaches that have yellow-flesh, such as the Salway, and they have just cause for this, as most of these late yellow-fleshed Peaches have poor flavour, and their flesh is dry and stringy; not so Lady Palmerston, ripe fruits of which were observed on trained trees in a glass-house; it is large, late, and excellent, and all that is yellow-coloured about it is the ground colour of the skin, and this is largely suffused and streaked with crimson.

A Plum for which there is a great demand is Monarch, and it was observed growing in pots and in the open quarters in large numbers; it is a good dark blue October variety, the bloom on the fruit very enduring. Another fine Plum, at present under number 97, resembles Sultan, i.e., shortish oval in shape, and of a reddish-purple colour, is a large kitchen variety now coming into use.

The plantation of large bushes of Apples, the ideal farmer's and cottagers' form of tree, is full of fruit, and splendid crops were noted of Lord Burghley, one of the best of late dessert Apples; a bush of Baxter's Pearmain, another excellent Apple, was carrying about 6 bushels of fruit; Scarlet Golden Pippin, a highly ornamental fruit of good quality, is a very prolific bearer, the bushes being literally coloured with the reddish-orange fruits. Pitmaston Pine is another highly ornamental fruit that can be eaten from the tree, and for some considerable length of time; the habit is slender and erect, making capital columnar or vase-shaped bushes without much guidance. Wagener is a showy, free-bearing, red-skinned culinary Apple, to be highly recommended; the fruit keeps till April. Another long keeper is Lady Henniker, keeping till March; it is large and showy. Some excellent specimens were noted in the fruit-room of the Melon Apple, which is in season from December to March; the fruits would average 3½ inches in diameter. Buckingham is a large green kitchen Apple, said to be an excellent keeper; Peck's Pleasant might be taken for Sturmer Pippin, and lasts in good condition as long as that good old variety. These last two varieties are very free, and seldom fail to set a good crop out-of-doors.

For a highly ornamental variety of Apple, of extraordinary cropping capacity, bright crimson all over, and nice bashy habit, there is nothing to excel Bijou; it is prolific in the young state, and is in season from December to April. Splendid specimens of King of Tomkin's County Apple were observed on some pot-trees; it is a large dessert variety, said to be of very fair quality. If that be so, it is an advance on the samples of it which reach this country from Nova Scotia and U.S.A. Apple, Rivers' Codlin, a seedling of American Mother, cooks to a jelly, and is in season from September to

November. Early Rivers is an improvement on Lord Suffield, in that the tree does not canker, and it has a better constitution; it will probably drive Saffield out of cultivation.

The Pears in pots in the open still carried many fruits, which were of large size. These trees although grown in pots and styled Orchard House trees, benefit but little from glass protection, being placed under it merely at the flowering season, and towards the end of the autumn should the weather be wet and cold; this year there is no such necessity.

Amongst fine specimens of Pears, mention should be made of Conference, a variety that made its *début* last year. The variety has naturally a regular columnar habit, but it will make an excellent bush by stopping the leader. Magpate is another fine-looking Sawbridgeworthian production. The Parrot is a fruit not unlike Gansel's Bergamotte when ripened on the tree, and it is showy, as well as of good flavour—season, October. Bon Chrétien L'Ormier is a Pear that is good at the New Year. Fertility and several other of Mr. Rivers' successes in Pear raising were noted. Mr. Rivers is at present, we believe, the only man engaged in this country, in a systematic manner, on the fascinating work of raising varieties of fruit better in some particular point or points than existing ones. He has, as we know, lengthened our Plum season by ten or twelve weeks, the Peach and Nectarine season by half as much; he has added new varieties of dessert Pears, both early and late, which every one concedes are desirable acquisitions, and he is still busy with these matters.

TUBEROUS-ROOTED BEGONIAS AT YEOVIL.

It is a far cry from London to this pretty Somersetshire town, which lies embosomed amidst hills that during the long dry summer seem never to have lost their verdant greenness, and which when I saw them recently were covered with luxuriant herbage, or capital crops. But because a comparatively small and somewhat remote town, Yeovil can at least boast that within its bounds may have been seen during several past summers one of the best and probably largest collection of tuberous Begonias to be found outside the London area, and whilst being a nurseryman in general, Mr. B. R. Davis, is a specialist in Begonias. He has studied them closely, has made them so far his own, and whilst his collection is perhaps smaller than are those of Forest Hill, Swanley, or Bexley Heath, he has similarly high average of quality, whether of doubles or singles, and both in the west and throughout the midlands for his strain. Even at the moment of my visit, I find that instead of greeting him in his own house, he is away in America, where there is growing up a large demand for high-class Begonias, and in the interests of our growers long may it continue and increase. The Begonia Nursery is situate beside a main road, which leads from the town to the west; and at all times, but especially on Sundays, this thoroughfare is a favourite walk for the townspeople. Close beside the road is a large show-house full of plants that have for several months been profusely blooming. It presents, perhaps, the best gratuitous exhibition of the popular Begonia under glass to be seen anywhere, for all passers-by can stop here and have their fill of floral beauty; but in the open every available space is full of seedlings or selected plants in beds, and masses of these also adjoin the road, so that it is no wonder if any visitor to the town is taken to see the nursery, or that the passer-by finds attention arrested, and the sight eagerly and delightfully scanned. Like an ordinary looker-on, on the afternoon when I called, I mixed with a body of these rural or provincial critics, and whilst it was evident that they were full of deep admiration for the Begonias, some of their criticisms were of a very amusing order. To describe minutely the various sorts, whether single or double, would be needless. Anyone who has seen the grand collections of these flowers staged at the Temple Gardens in May, or at other of the Metropolitan shows during the summer, know what high quality is, and they could see at Yeovil just the same fine form, wonderful doubleness,

size of bloom, diversity of colouring, and excellence of habit. Begonias constitute no close preserve to anyone, and they are as likely to be fine in the country as in the town. The visitor sees in or out doors, where the seedlings are growing and blooming by tens of thousands, the beautiful whites, pinks, primroses, yellow, apricots, bronzes, reds, scarlets, crimsons, &c.; and amongst the doubles of diverse markings some have such defined and beautiful edgings that they are difficult to dissociate from yellow ground Picotees. In this direction specially there seems to be a chance of getting a new and beautiful strain. After all, to me, there were large quantities of varieties in masses that had particular charm, because they presented such beautiful material for bedding, and whilst we may in some cases admire fully the huge double and single flowers under glass, it certainly is the case that these are not bedders *par excellence*, for they are very susceptible to injury from rough winds and rains. The best bedders are those which, whether single or double, bloom freely, indeed profusely, have rather small than large blooms, and show these in the most attractive way. Of these, Robin Adair, double, crimson, very dwarf and free; Dandy, double, dark red, 6 to 7 inches in height, a great beauty; Postboy, 10 to 12 inches high, rich salmon-carmine, a lovely form in the mass; Colonel Lansedat, 8 inches, bold, erect, golden-yellow, very effective; Clemence Denisart, 14 inches, deep rose, and wonderfully free; Cactus, 7 to 8 inches high, reddish-cerise, beautiful for edgings and baskets; Altheaflora, 9 inches, rosy-magenta; Mauvette, reddish-magenta, giving a glorious mass of colour; and Lady Gertrude, a charming cerise-red, are some that need only to be seen in the bulk as I saw them at Yeovil to make them exceedingly popular for bedding purposes. Mr. Davis has devoted special attention to this section, and he is wise, for the day of the Begonia as a bedding plant is really yet to come. Besides these referred to, there are many more recently-raised varieties that are yet seen only in very limited numbers; but in another year or two, when put out in bulk, will be found to exhibit high merit. Whilst a few of the sorts named are of continental origin, the bulk are home-raised. The dwarfier forms are especially nice when employed as edgings to beds that have raised sides of a few inches high, margined with Sedums, such a variety as Clemence Denisart, giving the greatest body of colour, perhaps, ever seen on any form of similar height—14 inches; and it makes a fine centre mass. There is nothing fresh to be said now about raising Begonias from seed. The story has so often been told; but it is most evident here as elsewhere that fully 80 to 90 per cent. of most colours come pretty true to character from seed. Easy as it is to raise Begonias in this way, it is no matter for surprise that private growers prefer to purchase one-year-old selected tubers, as in that way they at once ensure having the best, and a fine show the same season. A. D.

KEYNES, WILLIAMS & Co., SALISBURY.

A spare hour in Salisbury recently enabled me to look in upon this old-established nursery, where Mr. Williams and Mr. Wyatt strive so well to maintain an ancient reputation. Whilst just now, as for so many years, Dahlias constitute the great feature, there are some other things meriting notice, especially pot Vines, of which there are great quantities of all the best sorts, and for which the firm has secured a high reputation. These now in houses will soon be put outside to harden-off and to winter. They stand chiefly in double rows, the rods being run up close to the glass, about 9 inches apart. All are in 10-inch pots, which it is easy to see are full of roots. They have not been unduly fed, a great mistake in pot Vines, as whilst large but pithy stems result, the roots are seldom good, and too often almost devoid of fibre. Great heat and high feeding are aerious evils in this form of Vine culture. The rods, though not stout, are very hard and brown, whilst the eyes are large and prominent. It is evident that first-class material is here found for

the production of good crops of fruit next year, and so great is the demand that it is very difficult to meet it. We may well wonder where all the pot Vines go to. Messrs. Keynes, Williams & Co. could help solve the problem. The next most interesting feature was found in varieties of zonal and variegated Pelargoniums blooming in the mass, with exceeding brilliance. Still it is a great Pelargonium season, and it was of more interest to examine the beds of Verbenas, which in named varieties are growing and blooming so profusely. I have not for a generation seen such very beautiful masses of colour as some of these gave, and I am sure no other plant in cultivation could have excelled them. Specially noticeable were of whites, White Queen, pure white, an occasional flower showing a scarlet pip, as a curiosity; and Boule de Neige, very large truss, dwarf, spreading, and free. Then of blues, the old Purple King, a very free bloomer; Purple Queen, more robust, bluish-purple, wonderfully free, a splendid bedder; and Lottie, very dark blue, with white eye, dwarf and very effective, were of the best. Scarlets were most effective. Lustrons, very dwarf, spreading, and fine truss, with white eye; Eclipse, brilliant scarlet, spreading and very free; and Royalty, fiery crimson-scarlet, were the best. Of other hues, a great beauty is Allemania, reddish-carmine, white eye—remarkably free; Nemesia, rich rosy-red, dwarf and spreading—very effective; Ethel Barne, rosy-cerise, a charming variety; and Edward Parkin, flesh-white, red eye, make up a beautiful dozen. It would be a pleasure indeed to see Verbenas blooming generally as at Salisbury, and more largely used for bedding. No doubt the heat has helped this floriferousness, as it has so hardened the wood that propagation is much more difficult than usual this year, as the firm find to be the case. Dahlias seem to be more robust than usual this year, due doubtless to the abundant waterings given, and the long period of heat. All the show and fancy forms have nothing to be desired, so far as height is concerned. Few reach 3 feet, a great improvement on the shows of twenty years ago. It is in the Cactus and Pompon sections that a great reduction of height is desirable, but it is doubtless here the case that feeding and water have made these sections exceptionally strong. The Cactus form, of which the firm have one of the best strain of seedlings in the kingdom, cannot be classed as decorative in the garden. They all more or less hide their blooms. But for the production of flowers for cutting, they are invaluable, and with Bertha Mawley, Panthea, Countess of Gosford, Countess of Radnor, Lady Penzance, and some others, there are being produced at Salisbury varieties that are now commanding wide popularity. This is but the result of careful cross fertilisation. In the production of new Pompons there is not less success. Some seedlings yet unnamed are very charming little beauties that will be seen effectively next year. It is satisfactory, however, to note that whilst these Pompons will grow tall, many of them throw their flowers so well above the foliage, that they are very effective in gardens. White Aster, Lady Blanche, &c., of whites are good, indeed all the whites are; so also are Juno, a large Pompon; Little Frank, Little Jack, Isabel, Lilian, G. Brinkman, Catherine, Janet, Crimson Beauty, Rosalie, Leila, and some few others, the flowers being thrown so well above the foliage. If grown in less rich soil, the habit is even better. So far as varieties are concerned of any section, it is not worth while to make selections, as all the best are being shown so profusely at exhibitions, and all are good if caught at the right moment. Without doubt at Salisbury, as elsewhere, the popularisation of the Cactus forms has done wonders for the Dahlia generally, and at the present moment there is hardly a tender plant that is more widely grown for flower, or held in higher esteem. A. D.

SOCIETY.

KINGTON, HEREFORDSHIRE.

SEPTEMBER 14.—This annual exhibition was held on Thursday, in the Burton Ploek. The display of flowers was exceedingly good for the time of year,

and the fruit was of unusual excellence. The vegetables were of first-class quality, the cottager's exhibits almost beating those of the professionals. Mr. R. Green took 1st prize for greenhouse plants. Lady Ormathwaite was a very successful exhibitor, taking premier honours for the best collection of fruit, 1st for culinary Apples, Roses, Runner Beans, Cucumbers, Celery, &c. Mrs. Banke, of Ridgebourne, also won several 1st prizes, and her exhibits all round were excellent. Mr. Robinson, of Lynhales, was 1st for Carnations, Dahlias, and several classes of vegetables. The table decorations exhibited were numerous and very pretty. Miss Passey taking 1st prize for the best arranged collection, Mr. Billiard 2nd, and Mrs. Peene 3rd. An extra prize was given to Mrs. Ward. Mrs. Wellington Lloyd took 1st for the best arrangement of flowers for hall decoration, Miss Passey being 2nd, and Mr. Dillow 3rd. Mrs. Peene won premier honours for best hand bouquet, and Miss Passey 2nd. There was a good display of Ferns. Sir W. B. Giles showed some splendid Tomatos, Nectarines, Roses, zonal Pelargoniums, &c., and took several prizes.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

A correspondent, "Devona," was glad if some of the readers of the *Gardeners' Chronicle* would instruct him in the cultivation of the following plants: *Nandæa Medusæ*, *Isochilus linearis*, *Sophronitis grandiflora*, and *Oncidium pulchellum*.

"THE GARDENER" (edited by David Thompson).—A correspondent is desirous of obtaining the numbers for July, 1879; April, 1881; and December, 1882. Communications should be addressed to the Editor.

(By the term "accumulated temperature" is meant the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named; and this combined result is expressed in Day-degrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.)

The districts indicated by number in the first column are the following:—

- 0, Scotland, N. Principal Wheat-producing Districts—
- 1, Scotland, E.; 2, England, N.E.; 3, England, E.;
- 4, Midland Counties; 5, England, including London, S.
- Principal Grazing, &c., Districts—6, Scotland, W.; 7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
- 10, Ireland, S.; * Channel Islands.

THE PAST WEEK.

The following summary record of the weather for the week ending September 16, is furnished from the Meteorological Office:—

"The weather during this period was fine and bright over the greater part of the Kingdom, but extremely heavy falls of rain were experienced over 'Scotland, N.W.' Towards the end of the week heavy rain also occurred locally at some of our southern stations.

"The temperature did not differ materially from the normal. The highest of the maxima were recorded on the 14th, when these varied from 79° in 'England, S.,' to 70° in 'Scotland W.,' and to 65° in 'Scotland, N.' The absolute minima, which were registered at most stations, either on the 12th or 13th, were very low generally; in 'Scotland, E.,' the thermometer fell to 29°; in the 'Midland Counties' and 'Scotland, W.,' to 30°; in 'Scotland, N.,' and 'Ireland, S.,' to 31°, and in most other districts to between 33° and 40°. In the 'Channel Islands,' however, the lowest reading was 52°.

"The rainfall greatly exceeded the mean in 'Scotland, N.,' and the 'Channel Islands,' but was much less in all other districts; in most parts of England the fall was extremely slight. At Glencarron during the 12th the fall amounted to as much as 3.59 inches, and at Fort William to 2.91 inches.

"The bright sunshine again exceeded the mean, the percentage of the possible duration, ranging from 58 in 'England, E.,' 55 in 'England, S.,' and 52 in the 'Midland Counties;' to 39 in 'England, N.W.,' over Ireland, and to 33 in 'Scotland, N.'"

MARKETS.

COVENT GARDEN, September 21.

[We cannot accept any editorial responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they fluctuate, not only from day to day, but often several times in one day. Ed.]

PRICES rule as last week.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

	s. d. s. d.		s. d. s. d.
Adiantum, per doz.	6 0-12 0	Foliage plants, doz.	12 0-42 0

Grapes, per lb. ...	0 6- 3 0		

SEEDS.

LONDON: Sept. 20.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maza Pond, Borough, London, S.E., report to-day's market thinly attended, with but little business doing. The supply of Trifolium exceeds the demand, and choice seed can consequently now be bought on most reasonable terms. Winter Tarax have become very scarce, and are again dearer. There is more doing in Seed-rye, at hardening rates. Mustard is 6d. per bushel dearer. There is no change in Rapeseed. Increased attention is given to Canary seed, and quotations have advanced 2s. to 3s. per quarter. Hempseed keeps steady. Linseed is quiet. For Peas and Haricot Beans there is a better sale.

FRUITS AND VEGETABLES.

BOROUGH: September 19.—Quotations:—Cabbages, 6s. to 8s.; Cauliflowers, 8s. to 10s. per tally; Turnips, 2s. to 4s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. 6d. to 5s. 6d. per bag; Damsons, 1s. 6d. to 2s.; Plums, 1s. 6d. to 2s. per half-sieve; Apples, 2s. to 8s.; Pears, 2s. 6d. to 9s. per bushel.

SUITABLEFIELDS: September 19.—Quotations:—Cabbages, 6s. to 8s.; Cauliflowers, 6s. to 10s. per tally; Turnips, 2s. to 4s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. 6d. to 5s. 6d. per bag; Damsons, 1s. 6d. to 2s.; Plums, 1s. 6d. to 2s. per half-sieve; Apples, 2s. to 8s.; Pears, 2s. 6d. to 9s. per bushel.

STRATFORD: Sept. 20.—There has been a good supply of all kinds of produce at the above market during the past week, and a brisk trade has been done at the undermentioned quotations:—Cabbages, 4s. to 7s. per tally; Cauliflowers, 9d. to 1s. 6d. per dozen; do., 3s. 6d. to 7s. per tally; Turnips, 2s. 6d. to 3s. per dozen bunches; do., 60s. to 70s. per ton; Carrots, household, 45s. to 60s. per ton; cattle-feeding, 30s. to 35s., do.; Mangels, 24s. to 26s. do.; Onions, English, 120s. to 130s. do.; do., Dutch, 4s. to 5s. 6d. per bag; do., Porto, 6s. to 7s. per case; Apples, English, 2s. to 4s. per bushel; Cucumbers, frame, 1s. 3s. to 2s. per dozen; do., field, 4d. to 8d. do.; Scarlet Beans, 3s. to 3s. 6d. per sieve; Celery, 10d. to 1s. 3d. per roll.

FARRINGTON: September 20.—Quotations:—Cauliflowers, 8s. to 10s.; Cabbages, 6s. to 8s. per tally; Turnips, 2s. to 4s.; Parsley, 2s. to 2s. 6d. per dozen bunches; Onions, 4s. to 5s. per bag; Marrows, 2s. 6d. to 3s. per hamper; Cucumbers, frame, 2s. per dozen; Pickling Cabbage, 1s. 6d. per dozen.

FARRINGTON: September 21.—Quotations:—Apples, 2s. to 3s. 6d. per bushel; Pears, 2s. 6d. to 5s. do.; Grapes, 13s. 6d. per barrel; Colmars, black do., 6d. per pound; Tomatos, 3½d. do.; Plums, 3s. per half-bushel.

ACHIMENES: E. W. It is the first double Achimenes we have seen. We will examine it and report later on. In the meantime keep the plant.

AMERICAN HOP: Nil desperandum. We do not know any such name, but being a popular one, we suspect it belongs to a plant that is not a Hop, and is not American. Can it be Origanum Didamnus?

BOOKS: W. H. Handy Book of the Flower Garden, by David Thompson. Blackwood & Sons, Edinburgh and London, price 7s. 6d.—A. M. The Illustrated Dictionary of Gardening, edited by George Nicholson; 4 Vols., L. Upcott Gill, 170, Strand.

INSECT ON DENDRONIUM: T. A., Warwick. The insect damaging leaves of Dendrobium densiflorum is a kind of thrips, possibly imported with the plants. The deformity in the bulbs is more likely to have been caused by the Cattleya-fly. There is nothing in the specimen sent, but indications that something has been there. R. McL.

INSECTS ON PHALANOPSIS: W. H. The beetle found on Phalanopsis is certainly a weevil (one of the Curculionidae), but crushed beyond all recognition, even supposing that to be possible in more than a general sense. It may be taken for granted that some of the natural enemies are sure to arrive with the large importations now taking place, and some of these if they become established here will probably not confine their attention to the plants in which they arrived. It may become a question whether newly-imported plants should not be placed in a purgatorium before being placed in the ordinary Orchid houses. R. McL.

MELON: H. Bell. The leaves seem to have been greatly infested with thrips, although none were present when they arrived. The stem shows signs of gumming, which may arise from eel-worms on the roots. Can you send some of the latter for inspection?

MUSCAT GRAPES DROPPING AFTER BEING POT IN THE GRAPE ROOM: A Subscriber. The appearance of the bunch points strongly to shanking being the cause; but the dampness arising from the quantity of Pears and Apples stored in the same room, and want of air, may have had something to do with it. You should not store other fruits with your Grapes.

NAMES OF FRUITS: We are inundated with packages of fruit to name, and greatly regret that, owing to the ill-health and absence of our pomological referee, delay in naming them is inevitable. Correspondents are reminded that whilst we are desirous to help them as far as we can in this way, it is no part of our bargain to do so, and the tax on our time and resources is very considerable. Recognising this, one Correspondent, a Belgian gentleman, has handed us a postal order to be applied to some philanthropic purpose. We propose to hand it over to the Gardeners' Orphan Fund, which would benefit greatly were all our correspondents equally thoughtful. No more than six fruits should be sent at a time. J. S. U. 2, White Doyenné; 3, Williams' Bon Chrétien; 6, Bêurre Clairgeau; 7, Passe Colmar. Others next week.—Herbert B. The old Windsor Pear.

NAMES OF PLANTS: Cynosurus. The flowers had almost all fallen, so that we name your grasses with much hesitation. 2, Bromus asper; 3, Aira cæspitosa; 5, Brachypodium sylvaticum; 6, Agrostis, perhaps canina.—F. J., Wantage. 1, Avena, near to A. fatua; 2, Lycium barbarum; 3, Hypericum Androsamum.—W. P. 5, omitted last week; Pelargonium alchemillifolium.—E. W. Datura Stramonium (Thorn Apple), poisonous. J. H. W. 1, Clethra alnifolia; 2, not recognised; 3, Andromeda axillaria; 4, Epilobium angustifolium; 5, Abelia triflora.—T. M., Oldham. 1, Adiantum cuneatum; 2, Pteris serrulata cristata; 3, Lastrea cristata; 4, Pteris longifolia.—S. B. Cattleya Dowiana aurea; a very good variety of it.—J. M. Stanhopea Wardii.—S. M. Celsia cretica.—Oakleaf. Rhamnus Frangula, grown for the gunpowder makers. Larch insect next week.—G. Bradford. You should send your Carnations to some specialist, as we cannot undertake to name florists' flowers.

PANCRATIUM FRAGRANS: Nil desperandum. In Baker's Amaryllidæ, this is included under Hymenocallis ovata.

PARIETARIA OFFICINALIS: Nil desperandum. Britain; common on old walls. It belongs to the Nettle family, Urticacæ.

RHUBARB: F. A. A vegetable used as a fruit.

TOMATO DISEASED: T. Simpson. The Tomatomould on the specimens sent is Cladosporium fuscum, Cke. It can be controlled by spraying with sulphate of copper, and maintaining a more buoyant air in the house. M. C. C.

COMMUNICATIONS RECEIVED.—W. J. Clarke, too late for insertion.—G. N.—T. F. R.—W. E. G.—Thomson Brothers.—H. W. W.—E. W.—Messrs. Backhouse.—A. D. M.—G. L.—J. W.—D. & Co., Naples.—F. B. S.—Sig. DIED.—On September 11, at Spotacre Nurseries, near Stone, Staffordshire, JOHN HILL, in his 69th year.

—GEORGE MANN, head gardener to Reginald Stanley, Esq., Manor House, Nuneaton. The deceased was about 35 years of age, and well-known as a local preacher of the Nuneaton and Atherstone circuit.

—We greatly regret to announce the death of Mr. HUGH LOW of the Clapton Nursery, which took place suddenly at Upper Clapton, on Sunday, Sep-17, of pneumonia. Mr. Low was in his 32nd year, and a general favourite. He was a member of the Orchid Committee, and of the Committee of the Gardeners' Orphan Fund. The funeral took place on the 20th inst., at Abney Park Cemetery.

EARL'S COURT EXHIBITION.
Exhibition of
GARDENING and FORESTRY
THE GARDEN of LONDON.

SEPTEMBER 27, 28, and 29.

GREAT SHOW OF HARDY FRUIT
AND VEGETABLES.

Classes (Open and Amateur) for Collections of Dessert and Cooking Apples, Pears, Peaches, Nectarines, Plums, Table of Hardy Fruits, 12 feet by 6 feet, arranged for effect, and Collections of Vegetables and Tomatos.

Meritorious Exhibits not named in the Schedule will be recognised.

Prizes, Medals, and Certificates awarded for every Show. All applications for entries, schedules, regulations, and further information should be addressed to Mr. H. E. MILNER, the Chairman, at the Offices of the Exhibition, Earl's Court, S.W.

ADMISSION to the Exhibition Building, Flower Show, and the Central and Western Gardens, and to one of 2000 free seats at Captain Boyton's World's Water Show, 1s.

REAL MANURE.

To make up for the loss
from drought, it is absolutely
necessary all should use the
above immediately. Its effect
is marvellous. Just one
powerful ingredient makes it
far superior to all others.

Mr. NOAH KNELLER,
Malshanger Pk., Basingstoke
Has had his supply, and says:
"The exact dimensions of one
Onion, 7 inches across, 19 inches
round, weight 2 lb. 9 oz.; twelve
Onions weighing 34 lb., which I
exhibited at Reading. Growed
solely by the use of CANNELL'S
REAL MANURE. A farmer said
that he wished his Swedes were
as big as my Onions."

H. CANNELL & SONS,
SWANLEY, KENT.

C. BEESON'S MANURE.—Composed of
Blood and Bone. The Best Fertiliser for all purposes.
Sold in tins, 1s., 2s. 6d., and 5s. 6d.; also in air-tight bags,
1/2 cwt., 6s.; 1 cwt., 10s. Full directions for use sent with each
tin and bag. 1 cwt. and above sent carriage paid, cash with
order. C. BEESON, Bone Mills, St. Neots, Hunts.

"I have tried this fertiliser on various garden crops, and I
am able to say that it is an excellent Manure for Vegetables,
Flowers, Vines, and Fruit Trees.
"A. R. GRIFFITHS, Ph.D., F.R.S.E., F.C.S."

To Nurserymen and Gardeners.
WANTED, the above, to try SPENCER'S
NEW ELECTRA GUANO.
Prize Growers of Flowers and Vegetables will find this the
most powerful yet harmless Fertiliser yet introduced. Sample
cwt. bag, 10s. carriage paid. Analyst's report with each parcel.
Agents wanted in districts not yet represented. First-class
men will be honestly and liberally dealt with.
Apply, I. SPENCER, 54, Spring Street, Hull.

BONES! BONES!! BONES!!! Any size
from dust to 1 inch. Dissolved Bone Compound, for
Top-dressing. All at 10s. per cwt.; less quantity, 1 1/2d. per lb.
Carriage paid on 1 cwt. Terms, Cash with Order. Special
quotations for large Buyers.

THOMAS GREEN & SON, LTD.,

LEEDS and LONDON,

HORTICULTURAL ENGINEERS to HER MAJESTY THE QUEEN, call Special Attention to their Patent Wrought-Iron Municipal or Angular Chambered

HOT-WATER BOILERS,

Others with TUBES, SHELVES, & HOLLOW or ORDINARY CAST-IRON GRATE BARS.

SADDLE BOILERS, With WATERWAY BACKS and WELDED BOILERS, any of which are specially adapted for Heating Greenhouses, Conservatories, Churches, Chapels, Schools, Public Buildings, Entrance Halls, Warehouses, Workshops, &c. They are the neatest, cheapest, most effective, and durable of any extant. The MUNICIPAL and TUBULAR ones are remarkable for their great heating power, slow combustion, and the length of time the fire will burn without requiring attention.

These Patterns secured the FIRST and HIGHEST PRIZE—a SILVER MEDAL—at the Royal Horticultural Society's Exhibition, South Kensington, London, June 1, 1881.

MUNICIPAL PATTERN BOILER, THE BEST EXTANT.

The longitudinal section gives a view of the fire-box, water space, flues, &c. The cross section gives a view of the fire box, water space and V-shaped back. The front elevation shows it set in brickwork, which is necessary for this class of boiler.

If set across three Columns the lowest charge will be 30s.

Page, £8; Half Page, £1 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Births, Deaths, and Marriages, 5s. each insertion.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

POSITION.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in remitting by Postal Order that it should be filled in payable at No. 42, DRURY LANE, to A. G. MARTIN, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.

Advertisements for the current week MUST reach the Office not later than Thursday noon.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, 42, Drury Lane, W.C., to A. G. MARTIN.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

COMMERCE, WITH ITS SPREADING WINGS, has traversed the globe many times, and binds nations together with the strong ties of mutual self-interest. Through its influence London has become the metropolis of the world, and her merchants have amassed wealth sufficient to make them the envy of princes. Holloway's Pills and Ointment have now become essential articles of commerce with all parts of the world. They have effected cures which have seemed miraculous, and given relief in complaints when all hope had been lost. In all known diseases their success has at all times been wonderful. In cases of disorders of the stomach, bile, liver complaint, indigestion, fevers, ague, &c., they act like a charm, as the cure is speedy and certain.

Send for ILLUSTRATED LIST of

JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS,

For Raising Water for the Supply of Towns, Villages, Irrigation, Railway Stations, Mansions, Fountains, Farms, &c.

No cost for Motive Power, which is obtained from a Stream of Water passing through the Ram. No Oiling or Packing required. Made in sizes to raise from 300 to 200,000 gallons per day. Will force to a height of 1500 feet.

SPECIAL RAMS for HIGH FALLS to send up One-third of the Water passing through them.

Fig. A.

This Ram raises a portion of the same water that works it.

View of Ram worked by water from a spring, and supplying the house and garden on the hill.

Fig. B.

This Ram, whilst worked by a stream of impure water, will pump clean water from a well or spring.

TESTIMONIALS FOR JOHN BLAKE'S PATENT SELF-ACTING HYDRAULIC RAMS:—

From T. DYNE STEEL, Esq., M.I.C.E., Past Pres. South Wales Inst. of Engineers, *Bank Chamb., Newport, Mon., April 24, 1891. Usk Waterworks.*

"DEAR SIR,—In September of last year I applied to you for a Hydraulic Ram for the purposes of the Usk Waterworks, to be capable of raising 27,000 gallons per day a height of 121 feet, with a working fall of driving water of 27 feet, and on your guaranteeing that performance, I gave you an order for the Ram. The Machine you supplied has now been put to work, and I have much satisfaction in saying that it far and away exceeds in its performance my most sanguine expectations, and possibly yours also. I have just completed a series of exhaustive tests with the following results:—

"Working fall of driving water, 30 feet; vertical height raised, 127 feet; length of rising main, 850 feet from Ram to outflow; length of supply pipe, 200 feet; gallons per hour raised 1612; driving water used per hour, 8185 gallons, showing the remarkable and gratifying result of 83 per cent. of efficiency.

"The tests were carefully made and repeated, the water measured, and levels properly taken. Several trials were made, and I shall be glad to give any Engineer interested in the subject facilities for repeating the tests at the spot.

"I may here state that for the rising main I used a large diameter of pipe in order to reduce friction, with excellent effect.

"Yours faithfully, T. DYNE STEEL."

From C. PAGE WOOD, Esq., *Wakes Hall, Wakes Colne, Essex, January 11, 1889.*

"SIR,—In reply to your inquiry, the Hydraulic Ram you put down for me in 1884 has cost me only 6d. in repairs (for a new stud my blacksmith made); the second Ram you put down to supply an off-hand farm has been running three years, and has cost not a penny in repairs; the third and largest Ram you put down two months ago, which is for the supply of water to my neighbours, is running satisfactorily. All three Rams throw up more water than you guaranteed. From enquiries I have made from friends who have Rams of other makers, I am convinced of the superiority of yours, and my third order is a proof of my good opinion. My abundant water supply is the greatest possible comfort to me.

"Yours faithfully, C. PAGE WOOD."

From Mr. THOMAS VARLEY, Agent to the Trustees of the late WILLIAM ROUNDELL, Esq., *Gledstone Estate, West Marton, Skipton, August 11, 1887.*

"DEAR SIR,—The Patent Hydraulic Ram you fixed five years ago on this estate is still working as well as it did on the day it started. It is driven by spring water carried along the hillside in 950 yards of iron pipe, and forces up an abundant supply to an underground tank on the hill at a distance of two miles from and at an elevation of 285 feet above the Ram. The water is then gravitated through several pipes and branches, having a total length of about four miles, for the supply of the mansion, garden, stables, estate work-shop, and steam boiler, the village of West Marton, and several farms. There are five fire-plugs inside the mansion and seven outside; and as the underground reservoir is 70 feet above the mansion, seven jets of water can be thrown over the house in case of fire. As there is still a considerable overflow from the underground reservoir running to waste, I intend to form a second reservoir at a lower level, and utilize the water for other farms. I have much pleasure in being able to report as above."

Blake's Hydraulic Rams have been supplied to the following amongst others:—

His Royal Highness the Duke of Connaught
 His Highness the Maharajah of Kashmir
 His Grace The Duke of Devonshire

"GARDENERS' CHRONICLE."

Continued Increase in the Circulation.

IMPORTANT TO ADVERTISERS.—The Publisher has the satisfaction of announcing that the circulation of the "Gardeners' Chronicle" has, since the reduction in the price of the paper, increased to the extent of 75 per Cent.

Advertisers are reminded that the "Chronicle" circulates among COUNTRY GENTLEMEN AND ALL CLASSES OF GARDENERS AND GARDEN-LOVERS at home, that it has a specially large FOREIGN AND COLONIAL CIRCULATION, and that it is preserved for reference in all the principal Libraries.

ADVERTISERS will greatly assist our efforts to get to Press earlier, by forwarding their favours as EARLY IN THE WEEK as possible.

Wanted.

H. CANNELL AND SONS would be glad to see Specimens of any really New and Improved Forms of either Fruit, Flower, or Vegetable; or any of the older kinds, extra finely grown.

Re HOPWOOD & SONS, NURSERYMEN, SEEDSMEN, and FLORISTS, CHELTENHAM.

FOR IMMEDIATE SALE.

UNDER DEED OF ASSIGNMENT.

TENDERS will be RECEIVED for the following Lots:—

LOT 1.—The Stock at Prestbury (nearly 7 Acres in extent), consisting of many thousands of choice Fruit Trees, Forest Trees, Rose Trees, Privet, &c.

LOT 2.—For Plants in a range of Greenhouses, and the Nursery Grounds at Belle Vue Nursery.

LOT 3.—For Greenhouses, Hot-water Apparatus, Carts, Tools, a strong Horse, &c., at Belle Vue Nursery.

LOT 4.—The Good-will of the Old-established Business carried on over half a century. Turn-over between Two and Three Thousand. Cash takings about £1 per day.

JOHN CORMELL, Trustee, Belle Vue Nursery, Cheltenham.

TO BE SOLD.—The BUSINESS of a NURSERYMAN, SEEDSMAN, High-class Florist, and Landscape Gardener, consisting of The Home Nursery and two branches, all situated in first-class positions, and having wide-spread and large connections, the turnover being about £5000 per annum, and making a handsome profit. The nurseries are crammed with an immense and valuable stock in splendid condition, and afford an opportunity rarely met with of acquiring a well-established and thoroughly genuine concern. Incoming for the whole about £3000. The fullest investigation.—Apply, in first instance, C. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO SEEDSMEN.—To be DISPOSED OF, in consequence of the death of the proprietor, an old established FARM and GARDEN SEED BUSINESS, with a wide connection in a good Market Town in the Midlands, and on Two Railways. This is a rare chance for a desirable purchaser that does not often occur.—Apply to SEEDSMAN, Messrs. Hurst & Son, 152, Houndsditch, London, E.

TO LET, a SMALL NURSERY, with six Greenhouses, all heated with Hotwater. Stock at valuation. Good connection of Jobbing Work. Low Rent.—Apply, Shakespeare Nursery, Shakespeare Road, Herne Hill, S.E.

SATURDAY, SEPTEMBER 30, 1893.

J. B. GUILLOT AND HIS ROSES.

THE kindly sympathetic notice of this good and successful rosarian, from the pen of Mr. W. Paul, which appeared in your issue of September 16, seems to mark the present time as suitable to draw attention to the debt which all rosarians owe him for the numerous beautiful varieties he has added to our gardens, and it is a somewhat remarkable fact that in the year of his death two of these Roses have been exhibited in a character which they have, perhaps, never shown before. Horace Vernet among hybrid perpetuals, and Madame Cusin amongst Teas at the great Show of the National Rose Society, having obtained Silver Medals for the best Rose in the nursery and amateur classes.

It is now many years since I first made the acquaintance of Guillot; his aged father was then alive, so that we used to call him young Guillot, how many years may be judged from the fact that it was before he had sent out La France, which I saw then in his garden, and of which he was justly proud, so proud that he would not part with it on any consideration, even for a sum which to a Frenchman seemed temptation itself. There are some of his Roses which have appeared and gone out of cultivation, but I think fewer than those of any other raiser, for he was always chary as to those he sent out, and it was seldom indeed that he made mistakes, and his gardens in the Chemin des Pins may well be regarded as classic ground by all lovers of the Rose. The following may be regarded as the cream of his contributions to our catalogue for the garden:—

HYBRID PERPETUALS.

Horace Vernet.—This magnificent Rose, which in some seasons (as in the present) has appeared so often in such excellent form, combines all those qualities which make a flower valuable, whether for the exhibitor or the simple lover of Roses. Its beautifully imbricated form and brilliant crimson colour with dark shadings, make it always acceptable. Unfortunately, it has one drawback, it is a bad grower, and is apt to break the heart of a young amateur; he has gathered a fine bloom from it, and naturally looks forward to a better supply next season, but the plant dwindles, and if it does not die outright, presents a miserable appearance. When a Rose is described as best on maidens, it affords a pretty strong evidence on the weakness of its constitution, and that the young amateur had better leave it alone.

La France.—This Rose has had a curious history, I do not believe that Guillot himself knew what its parentage was; he believed that it was of a mixed race, but for a great number of years it was numbered amongst the hybrid perpetuals, both in French and English catalogues, but upon the advent of some Roses which

were called hybrid Teas, and which were the result of a cross between hybrid perpetuals and Teas, La France suddenly changed its place, and is now numbered amongst hybrid Teas. So, that where a prize is offered for hybrid perpetuals alone, it cannot be exhibited; where, however, the prize is for a certain number of varieties without distinction of class, it is admissible, as it is also in that new and perplexing class which the National Rose Society has established—hybrid Teas. M. Guillot was quite right in forecasting the popularity of this Rose, for its profuse blooming and delicious fragrance have made it an universal favourite. In one instance, however, he has been wrong: he expected it to be the parent of a new race, but as yet not a single seedling from it has appeared; we have had sports from it in Augustine Guinoisseau and Duchess of Albany, the former a white, and the latter a rosy-pink sport. It may be that this season, so favourable for the production of the seed-vessels, may change this condition of things.

TEAS.

Catherine Mermet.—This lovely Rose requires but little description, its exquisite shape and fresh colour are alike welcome in the garden and in the exhibition stand; it is one of those Roses, too, which is inclined to sport, and in The Bride which comes to us from America, we have a most formidable rival to the mother flower.

Waban, which is a dark sport, is not yet sufficiently known, but if it attains the character which has been given to it by some growers, is likely to be a valuable addition to our exhibition flowers.

Comtesse de Nadailae.—If he had raised no other Rose than this, he would have been entitled to the gratitude of all rosarians. It is impossible to describe its colour, which is a combination of peach, apricot, and coppery-rose, or to exaggerate its beauty. It is, in my estimation, the *crème de la crème* of Tea Roses; who has ever stood before a stand of it as exhibited by Mr. Geo. Prince but has acknowledged that for refinement and delicacy of tint it has no rival. With some persons it is a delicate grower, and does best on a half-standard; it amply repays the protection of a wall, and two plants of it which I have so placed always gratify me with blooms of deep colour, and I have seen in some places shoots as thick as one's finger, from plants in the open.

Etoile de Lyon.—A vigorous grower, and a large and full flower—so much so that it requires a warm season for it to open properly; this year, therefore, has well suited it. It has also the bad property of becoming cleft (that is, with two centres instead of one), which, of course, detracts from its beauty; however, it is so fine when it does come right that it will not do to dispense with it.

Madame Cusin.—Never, perhaps, since this flower was sent out in 1881, has it been seen in such perfection as when exhibited by the Rev. A. Foster Melliar at the National Rose Society's metropolitan exhibition this year; in size, form, and freshness of colour, I do not think it has ever been equalled, and it required but little discrimination to decide that it was the best Tea in the show. Indeed, some were inclined to say it was the best Tea Rose ever exhibited; this is a very wide expression of praise, and I do not think I can quite endorse it, when I remember some of the grand Nadailae exhibited by Mr. Prince—but, without question, it was a splendid flower.

Madame de Watteville.—A very beautiful Rose, but I do not think it can be called a very hardy one. I know that in many places it suffered severely during the winters of 1891-92. The colour is very exquisite, creamy-white, with rose on each of the petals. When caught in its proper form, it is like Marie Van Iloutte, most exquisite, but lacks the constitution of that fine flower.

Madame Hoste.—One of the newest of the raiser's additions to this class, and this year has fully estab-

lished its merits; it has been everywhere exhibited in good form, and has more than once obtained the Silver Medal for the best Rose. At one time it was thought to be too thin for exhibition, but this year has proved that was fallacious. It is certainly better for disbudbing, and of all autumn-blooming Teas it is certainly one of the freest; and this season, which has been so favourable for autumn flowers, has seen it produced in great quantities.

Madame Hippolyte Jamain.—I do not consider this by any means equal to others of Guillot's raising. It is very full, and is inclined in wet seasons to get gummed together; but in dry seasons, especially in the autumn, it is a useful flower. It is very vigorous in growth, and a good constitution.

Madame Margottin.—This flower, which was at one time much sought after, is, I fancy, declining in favour, for certainly one does not see it so frequently on the exhibition table; its difficulty in opening may perhaps account for this, and as there are other flowers of the same colour which have not this defect, it is probable that ere long it will be numbered amongst the "has-beens."

Ernest Metz.—One of the latest of Guillot's seedlings, seems likely to uphold his character as a seedling raiser. The colour is a bright salmon-rose, globular in shape, but some doubts have been expressed as to its constancy. For three years special prizes have been offered for it at the National; in two of those it was not competed for, and in the present year but two stands were shown. However, like most new Roses, it has probably been overworked, and this defect of uncertainty may be obviated in future seasons.

Gloire Lyonnaise.—About nine or ten years ago, considerable sensation was excited in the Rose world by the news that Guillot was about to send out a yellow hybrid perpetual. Visions floated before their eyes of some Charles Lefebvre with the golden-yellow of *Maréchal Niel*; but alas! they were doomed to disappointment, for *Gloire Lyonnaise* is but a hybrid Tea, with the very faintest *souçon* of yellow in it; it is not an exhibition Rose, but an excellent one for the garden, and has been rightly placed in the catalogue of the National Rose Society amongst hybrid Teas suitable for garden purposes.

Such are my views of Guillot's flowers, and I rather fancy they will be in accord with most rosarians'. *Wild Rose.*

RAINFALL AND DRAINAGE AT ROTHAMSTED.

ALMOST from the commencement of the agricultural experiments at Rothamsted, Hertfordshire—that is, for a period of more than forty years, the rainfall has been measured in a gauge of one-thousandth of an acre area. Three drain-gauges also of one-thousandth of an acre each, for the determination of the quantity and chemical composition of the water percolating respectively through 20 inches, 40 inches, and 60 inches depth of soil (with its subsoil in natural state of consolidation) were constructed in the year 1870.

The nitrogen existing as nitric acid, sometimes in other forms, and also some other constituents, are, and for some time past have been, determined periodically in the Rothamsted laboratory, in both the rain and the various drainage waters. The memoranda for the fiftieth year of the experiments, which have recently been issued under an entirely new and greatly improved form, give us much valuable information, not previously published, upon the above subject.

The rainfall at Rothamsted during fifteen harvest years, 1877-8 to 1891-2, has varied from a minimum of 21.36 inches to a maximum of 41.05 inches; the average for the total harvest year being 29.81 inches.

The distribution of rainfall, taken in four monthly periods, has been, from September 1 to December 31, 11.22 inches; from January 1 to April 30, 7.82 inches; and from May 1 to August 31, 10.77 inches.

The annual drainage during the same fifteen harvest years, from the drain-gauge of 60 inches deep of heavy loam with clay subsoil, and uncropped,

has ranged from a minimum of 6.50 inches to 24.38 inches, equal to a yearly average of 14.83 inches.

The evaporation from the bare soil averaged 4.54 inches from September to December, 2.74 inches from January to April, and 7.70 inches from May to August. When rain-water falls upon a soil it dissolves some of the ingredients which the soil contains, and these dissolved matters finally appear to a greater or less extent in the drainage-water. With reference to the large amounts of loss of plant-food, which the Rothamsted investigations show, it is stated by Lawes and Gilbert, that probably not more than an average of about 5 lb. of nitrogen would be contributed annually per acre from the atmosphere in rain and the minor deposits, exclusive of any condensation by the soil. Moreover, the soil of the drain-gauges has been unmanured since 1868, but being exposed to the access of air from below as well as from above, the oxidation of the nitrogenous matters within the soil may be more active than in similar soil in its natural condition. Also, the soil has been without any vegetation to arrest the nitric acid formed.

Under these conditions we find the quantity of nitrogen as nitrates annually removed from the soil by the drainage-water, during fifteen harvest years, 1877-8 to 1891-2, has varied from a minimum of 20.19 lb. to a maximum of 60.94 lb. per acre, equal to a loss of 129 lb. and 389 lb. respectively of ordinary nitrates of soda per acre. The average loss for the total period of fifteen years being 34.71 lb., equal to 222 lb. of nitrate soda per acre. The distribution of this loss was 109 lb. from September to December, 66 lb. from January to April, and 47 lb. from May to August.

These facts show that the quantity of nitrates removed from the soil in the autumn drainage-waters is greater than at any other period of the year, the drainage-waters being most concentrated at this season, and the drainage also usually abundant. This excess during autumn is found to be most marked in the drainage from the shallowest soil. The effect of a heavy and continuous rain in removing exceptionally large quantities of nitrates from the soil is strikingly shown by the results obtained in October of 1891. In this month 6.76 inches of rain fell at Rothamsted, and the quantity of nitrogen as nitrates in the drainage-water from the 20-inch gauge amounted to 13.28 lb. per acre, equal to a loss of nearly 85 lb. of ordinary nitrates of soda per acre. For the reasons already given, the loss of nitrates by drainage may be considerably less in an ordinary agricultural fallow than in the Rothamsted drain-gauge experiments, yet the loss must clearly be a very serious one whenever the season is wet.

Bare fallow, therefore, can only be thoroughly successful in a dry climate. Under such circumstances, the active production of nitrates which takes place in a fallow will doubtless greatly increase the fertility of the soil for the succeeding crop. *J. J. Willis, Harpenden.*

CIGARETTE SMOKING IN PERSIA.

THE British Consul, reporting on the trade of Rish, under the head of Tobacco, says:—"It is a noteworthy fact that the introduction of this plant into the northern provinces of Persia, has had the effect of introducing the general practice of cigarette-smoking into the country. This practice has, indeed, become so general, that even the lowest peasant now goes about with a cigarette-case and cigarette-paper, and makes his own 'smokes.' Until quite recent years, only kalians or hubble-bubbles, and chibonks or long wooden pipes, with red-clay bowls, were used, the former generally by the higher classes, and the latter by the peasantry, labourers, and mule-drivers, in fact, people constantly on the move, and requiring a more portable apparatus. The chibouk has now been, to a very great extent, replaced by cigarettes, the tobacco for this purpose being cheaper than the Shiraz *tumbeke*, which is required for kalian and chibouk."

CASIMIROA EDULIS.

WE give in our present issue an illustration of this little-known fruit, which has ripened in the garden of Cavalier Hanbury, of La Mortola, near Ventimiglia. The fruit is similar in form to that of *Diospyros Kaki*, but of a yellow colour, measuring 5 centimètres across. This is, we believe, the first time that the fruit has been produced in the open air in Europe, but in 1877 (October 13) we had the

to produce injurious effects would be much larger than anyone is likely to be able to avail himself of. The tree is a native of N. W. Mexico.

THE SEED TRADE.

THE FOREIGN GRASS AND CLOVER-SEED CROPS.—It would appear that in the seed-growing districts

pecurus pratensis (Meadow Foxtail) is satisfactory, and the quality of the seed good, but prices are advancing. The sweet-scented Vernal-grass (*Anthoxanthum*) show a small crop, and prices are certain to be high. The Brome-grasses (*Bromus*) have yielded much better than was at one time expected. Crested Dog's-tail (*Cynosurus cristatus*) is being delivered in small quantities, and prices are higher than last season. The German and French

FIG. 63.—CASIMIROA EDULIS.

Ripe fruit from the Garden of Cav. T. Hanbury, La Mortola. The sections show the fruit cut through vertically and transversely; one seed is also shown in section.

opportunity of figuring the fruit as it was ripened in a tropical house in the garden of Mr. Mitchell Henry, at Kylemore, Galway. Mr. Henry's gardener considered it the best tropical fruit with which he was acquainted. The best account of the tree is given in Seemann's *Botany of the Herald*, an extract from which was given in our columns at the time above mentioned. Though the fruit is edible, it is said to promote sleep, and the seeds are said to be poisonous. We imagine, however, from its Rutaceous affinities, that the quantity of fruit or seed required

of Darmstadt the abnormal drought has been as severely felt as in England, which has operated to prevent the full development of all grass and Clover crops; some have yielded very sparingly, and others scarcely a crop at all. Of *Agrostis*, the crop has failed entirely in Germany; in the United States it is a medium one, and as consumers will be dependent upon this for a supply, prices are sure to rule high. *Aira flexuosa* and *A. caespitosa* (Hair-grasses), are in very small quantities, and will probably be required for sowing. The crop of Alo-

Crops of Rough Cockfoot Grass (*Dactylis glomerata*) are not now much prized in the market, and the main supply is derived elsewhere. America has a small yield, discoloured and impure, and New Zealand will have to furnish the bulk of what can be obtained; the reports from there, however, are not particularly encouraging, and a considerable portion of the yield has been destroyed by fire. Prices are therefore advancing. The Feacue Grasses suffered a good deal during the winter, and the yield is only about one-fourth of the usual crop, and high prices

prevail in their case. The fine-leaved Sheep's Fescue (*F. ovina tennifolia*) was not only seriously damaged by the drought; but in some cases burned out, and very high prices rule. The Meadow Fescue is the smallest crop registered for several years, and as America also has harvested only about one-third of an average crop, seeds are certain to be very dear. *Holcus lanatus* (Meadow Soft Grass) is only one-quarter of an average crop, but very fine quality. Timothy (*Phleum pratense*) is, as far as the American yield is concerned, a satisfactory crop, both as to quantity and quality; the German crop has not yet been realised. Both the Wood and the Smooth Meadow Grasses (*Poa nemoralis* and *P. pratensis*) show quite small crops. The Rough Meadow Grass (*P. trivialis*) is a very good crop indeed; the colour and purity of the seed excellent. The Canary Grass (*Phalaris arundinacea*) has yielded scarcely any crop this year.
